I am not a racer, but as I notice "Deja" mentions both the Potomac and James rivers, he must live "somewhere hereabouts," and should this be the case, it will give me great pleasure to try the merits of a canoe 14ft.x30in. against "Deja's" cutter anywhere in the Potomac between Alexandria and Washington at any day "Deja" may fix. He can learn my address through you, Mr. Editor. Many canoeists have read "Deja's" article in your canoeing columns, and considering it a mistake of the printer, have left "Deja" and others to the enjoyment of their "cruising yachts" without any desire to interfere with their hobby or that of the Puritan or Genesta. "Deja's" cutter is not a canoe, and if he cannot find a place for it among catboats and such like, please do not foist it off on us, but create a new column for his especial benefit if he is so lonely and forlorn as to desire companions. A CANOEIST.

JERSEY CITY Y. C. CANOE RACE.

THE club arranged to have a canoe sailing race on the day of their annual regatta. A cup presented by Mr. Crane was offered as a prize for the winner and the race was open to all canoeists about New York. It so happens that the canoeists hereabout are all business men, and find it difficult to get away for a day or part of the day in the middle of the week, the day set being Thursday. The race was therefore postponed to Sept. 26, Saturday. The course was from stakeboat near club house to and around the piles near the S. E. corner of Black Tom, thence to can buoy near Ellis Island, and to starting point, leaving every mark on port hand, around the course twice. Six miles Allowance one minute to the foot.

The entries were: Psyche, C. K. Munroe; Fanny, S. B. Crane; Tramp, C. J. Stevens; Sea Urchin, B. H. Nadal; Siren, R. B. Burchard; Guenn, William Whitlock, and Lassie, C. B. Vaux. Tide was just beginning to flood inshore, but still strong ebb in channel. Stiff breeze from S. S. W., making the first side of the triangle a beat to windward with a long leg and a short one. At the signal six canoes came down to the line in a bunch, leaving Guenn, who had mistaken the directions and gone too far south out of the race; a new start was called. Guenn bore away to get into position, and in so doing fouled a sloop at anchor and carried away her (Guenn's) mast, thus throwing her out of the race.

At 3:35:30 Fanny crossed the line and ten seconds later all six canoes were over and thrashing up to windward with a spanking breeze and in lively chop of a sea. Fanny took in a reef shortly as did Lassie just before she turned the piles, having out-pointed and out-footed the fleet. Fanny and Psyche were having close work of it with the odds in Psyche's favor. The buoy at second turn was well out in the main channel in very rough water—tide and wind opposed. Lassie did not risk jibing but luffed up and came about, as did also Psyche and Fanny. From the buoy to home stakeboat was before the wind, making very lively sailing in the freshening breeze and seaway. The Tramp ran through the smooth water in the lee of Bedloe's Island and pitched into the rough channel just as a squall swept by. The canoe heeled over, dropped the boom into the top of a big wave and was tripped up. Sea Urchin and Siren at once came to the rescue. Tramp's crew boarded Sea Urchin and was taken to the club house for some dry and warm clothing. Siren saved the wreck by beaching on Bedloe's Island. Tramp was there pumped out and came home later in tow of Siren. Meantime Lassie, Psyche and Fanny were spinning along on their second round ignorant of what had happened to the canoes behind them. On the windward work Lassie made a decided gain as before and won. Psyche and Fanny changed places several times; Psyche getting a lead near the piles increased it on the run and came in well ahead. The exact times are here given:

	Start.	Finish.	Elapsed.	Corrected.
Lassie	3 35 45	5 02 25	1 26 40	1 26 40
Psyche	3 35 45	5 15 00	1 40 15	1 38 15
Fanny	3 35 30	5 19 45	1 44 15	1 42 45
Guenn	Disabled; did not start.			
Siren	Bent on claiming salvage.			
Sea Urchin	Bent on claiming salvage.			
Tramp	Capsized.			

Vice-Com F. C. Brower-Archer was judge and starter, and Mr. J. F. Carnes presented the cup to the winner, at the same time making a very neat and appropriate speech, in which he said he had never seen a canoe under sail before that afternoon, and were his hair a few shades darker (it had turned gray) he fully believed he would get a canoe himself, so charmed had he been by them.

TORONTO C. C.—On Saturday, Sept. 19 a paddling and sailing race was held with seven entries. Colin Fraser, canoe Kate; Arthur Mason, canoe Evora; Frank M. Nicholson, canoe Sadie N; John L. Kerr, canoe Ada K; Hugh Neilson, W. G. McKendrick, Robt. Tyson. Mr. Fraser won in the Kate. Mr. McKendrick won the Mason Paddling Cup, with F. W. Mason second and Arthur Mason third. On Sept. 26 the club held their regatta, the first race being a half mile handicap, won by W. G. McKendrick, canoe Wenona, with F. W. Mason in the Whimbrel and Arthur Mason in the Evora, second and third. Mr. Wm. Leys won the open canoe race, half a mile and turn. The tandem race brought out the following: Colin Fraser and Mr. Jacques, canoe Wanda; Hugh Neilson and Fred W. Mason, canoe Whimbrel; W. B. Raymond and W. G. McKendrick, canoe Wenona; Frank M. Nicholson and Arthur Mason, canoe Evora. Wanda won, with Whimbrel 4ft. astern. Messrs Leys and Parsons had a walkover in the 30in. open tandem race, doing the half mile in 5¼min. The sports concluded by Mr. Arthur Mason showing how a canoe may be righted and entered after a capsize. He dived under his boat, staying there some time, and finally rolled the boat right side up while lying inside.

HARTFORD C. C.—An interesting race took place on the Connecticut River on Monday afternoon, by canoes of the club, for the privilege of starting in the final race for the Commodore's Cup. The day was fine, the air clear and bracing, and a light breeze blowing up the river from the southwest. The course was about two miles, from an imaginary line across the river, thence north around a stakeboat, thence south to a second stakeboat and return to the starting line. The entries were the canoes Rambler, E. Hart Fenn; Leila, J. C. Abbott; Caroline, Col. J. L. Green, sailed by W. B. Davidson, and Kestrel, Rev. Francis Goodwin, sailed by Mr. Forrest. The race was quite close from start to finish, Rambler winning by 40 seconds, Caroline second, Kestrel third and Leila fourth.

A LIGHT CANOE.—Mr. Rushton has lately finished a very light canoe 11×28×9½ with 5in. sheer. The weight was to be under 25lbs. Mr. Rushton also reports that his sales have exceeded those of any previous year by nearly fifty per cent. He is engaged on a new catalogue of boats and canoes, which will be ready earlier than usual.

A HANDSOME CLUB BOOK.—Decidedly the neatest club book that has yet appeared is that of the New York C. C. for 1885. It is handsomely printed on heavy linen paper, with a cover of vellum paper, on which is the club flag in red.

VESPER BOAT CLUB.—On last Friday night the Vesper Boat Club, of Lowell, gave an entertainment, the chief feature being an illumination of the house and fleet. From the roof down the house was decorated with Chinese lanterns, while inside the reception room was decorated with plants and hangings. Off the house was the steamer Pinafore, with a band on board. On the water were some 30 canoes, each with its string of lanterns in fantastic outlines. At 8 P. M. Messrs. Butler and Nichols marshalled the fleet and headed up the river, then they came down, first in two lines across the river, then in single file, each following the leader in a zig zag route over the river. After the parade and fireworks a dance was given in the club house.

OTTAWA C. C. RACES.—The high wind of Sept. 19 interfered with the programme of the Ottawa C. C. and but one race was called. This was a sailing race from Nepeau Point to Earnscliffe and back, the entries being Iolanthe, R. McLeod Maingy, and Irene, R. W. Baldwin. Irene was hindered by an accident to her steering gear and Iolanthe won. On Monday the single paddling race came off, over a course of 1½ miles. The entries were Irene, R. W. Baldwin; Iolanthe, Mr. Wheeler; Hazel, Mr. Borough; Ottawa, Mr. Wicksteed; Emma, Mr. Hemming. All were started at 4:30, Irene leading over the course and winning, with Hazel three lengths astern and Iolanthe third.

Yachting.

THE OCEAN YACHT RACE.

A NOBLE sight is this, I ween,
Fair panorama of the sea,
The ocean white with crested foam
To windward and to lee;
Bright shines the day on Staten Isle,
On woods of emerald green,
On stately dome and villa roof,
With field and lawn between.
Long Island stretches east away,
Engirdled with the brine;
On sandy bar and weedy rock
The glorious sunbeams shine.

Full many a score of stately yachts
Wide o'er the sea are spread,
Careening like white-plumag'd birds,
On rushing pinions sped.
Vast steamers bound for foreign land,
Their smoky banners raise;
The flag of every nation
Its blazon'd field displays.
The sounds of martial music
From many a deck arise,
Loud shouts of acclamation
Swell grandly to the skies;
From fortress wall and green parade
Ring out the cannonade.

Off Sandy Hook two stately yachts
The broad arena sweep,
White meteor flag and flag of stars
To each tall masthead leap;
Each emulous to win the prize
For speed in ocean race;
To claim the palm of victory
O'er ocean's rolling space.

See how they matchless ride the seas,
Like rush of desert steed,
Graceful as swan on limpid lake,
Swift as the eagle's speed.
A cloud of canvas each displays
From deck to topmast head,
Jib, mainsail, spinnaker,
In ample folds outspread.

Onward, right onward see them fly,
Cleaving the tumbling surge;
A score of miles away the goal
To which the champions urge.
The mark is reach'd, and homeward now
On free wind turns each dashing prow.
So ends the race, the first great race,
Where Puritan holds foremost place;
But nobly in the watery way
Genesta bore her flag that day!

Once more these yachts the challenge fling,
Again on rushing wings they swing;
From Scotland Lightship swift they bear,
Each yacht a pyramid of snow,
The white sails blossoming high in air,
Balloon jibs all aglow!
Yielding to pressure of the breeze,
Thro' the salt ocean-sleet they dash,
Plunging thro' maelstrom of green waves,
Through whirling foam they flash.
'Tis battle of flight and chase,
Pursuer and pursued;
The centerboard, the cutter race,
Fought out o'er ocean flood.
Ah, Puritan hath won the prize!
And cheers exultant rend the skies.

GREENPORT, L. I. ISAAC MCLELLAN.

ATALANTA AND STILETTO.

THE decision of the Regatta Committee of the American Y. C. on the protest made by Mr. Jay Gould, on the ground that Stiletto did not round Sarah's Ledge buoy properly in the race last July, has just been made public. Mr. Gould presented fourteen affidavits from persons in New London, to the effect that Stiletto did not pass the buoy to the south and east, while the crew and guests of the latter aver that she did. The committee decide to allow the protest, and have awarded the prize to Atalanta. Mr. J. B. Herreshoff thereupon forwarded the following challenge to Mr. Gould:

BRISTOL, R. I., Sept. 21.

Jay Gould, Esq.:

I hereby challenge the Atalanta to race with the Stiletto over a 100-mile course on the Hudson River, from a point off the foot of West Twenty third street 50 miles up and back, on Saturday, the 26th inst., and will join you in the purchase of a championship cup, worth at least $500, to be held by the winner, subject to the challenge of any yacht which may be disposed to race for it thereafter. The cup will be held subject to the conditions that it must be sailed for over the same course, and that, in order to win it, the challenging yacht must go over the course in less time than that previously made by the yacht which holds it. Please reply by return mail and name your judge. Yours truly, JOHN B. HERRESHOFF.

To this Mr. Gould replied with the following challenge;

NEW YORK, Sept. 23, 1885.

J. B. Herreshoff, Esq.:

DEAR SIR: Your challenge to race the Stiletto with the Atalanta over a 100-mile course on the Hudson River, from a point off the foot of West Twenty-third street about 50 miles up and back on Saturday, the 26th inst., was received this morning. In reply permit me to state, although you are doubtless aware of the fact, that over a part of the distance named by you on the Hudson River the Atalanta can steam only at three-quarter speed, and whenever a large tow is met her engines must be run at dead slow. The Atalanta's time over the American Y. C.'s course in 1884 was 4.42.57, that of the Stiletto in 1885 4.49.54, so that up to date the Atalanta has made the fastest time over the course. However, as you appear to want a race to settle the relative speed of the two yachts over a long distance course, I suggest that we race from Sandy Hook to St. John's, Newfoundland, for a challenge cup, to be held under the conditions you propose. As it will cost $3,000 to fit out the Atalanta to run her to St. John's and back I propose that we each put up $2,500, to be forfeited by the owner whose yacht does not go over the course at the time agreed upon. Yours truly, JAY GOULD.

The proposal that Stiletto shall enter such a long race in the open sea is so absurd that there is no probability that it will be accepted, as in any rough weather a big ocean steamer like Atalanta would quickly drown out a little torpedo launch, however fast the latter might be.

A NEW BOTTOM PAINT.

Editor Forest and Stream:

Your correspondent "Loyalty" has been so handsomely handled by your other correspondent, "Yankee Doodle," and moreover, the personal tone of his last effort is so apparent that I am content to drop the Puritan sloop question, so far as he is concerned, with the remark that it is my intention to ascertain the exact draft of water of several of our old well-known sloops, merely to show whether or not Puritan is, comparatively, a sloop of heavy draft, and thus, in shape, approaches the modern racing cutter.

And now for another matter which will be of greater interest to your yachting readers than the exchange of schoolboy "arguments." The question is frequently asked: "Where can we find a durable, smooth paint for yachts' bottoms, something which will keep worms from attacking the wood, and entirely prevent the growth of barnacles and grass?" I have tried nearly all the kinds advertised with the result that, up to last summer, all are more or less failures excepting pure copper bronze, and it is very expensive.

Last spring I had sent me by the owner of a small yacht I was then building, four gallons of paint with the request that I should give it a fair trial.

I also purchased a further supply and used it on several boats, one of which (a 40ft. yacht) has been moored in this harbor all summer, and thus far not a sign of grass nor a barnacle has appeared on her bottom.

The paint is called "Ulesote," and seems to be pure zinc finely pulverized. It costs about as much as white lead. In appearance it resembles the ordinary pot lead as usually applied for racing purposes. It dries very quickly, and if lightly rubbed with fine sandpaper, forms quite as smooth a surface. THOMAS CLAPHAM.

ROSLYN, L. I., Sept. 26, 1885.

THE OCEAN RACES.

SEPT. 21—SANDY HOOK AND BRENTON'S REEF.

IT would seem at a casual glance that a record of three important ocean races such as the Bennett-Douglas, the Brenton's Reef and the Cape May, all sailed within two weeks, betokened a real revival in American yachting; but such, unfortunately, is not the case. True, these cups that have laid unclaimed season after season have at length been raced for and won; but this is due only to the spirit of an English yachtsman, and if the three races prove anything, it is only the apathy of American yachtsmen, who have let the three cups go with barely a show of defending them. However, the races have served one good purpose in showing what a boat Genesta really is, how far she is superior to the great bulk of our yachts, and also where the Cup would now have been without fail, but for the happy Inspiration of some Eastern yachtsmen.

After starting at the Lightship on Monday, Genesta at 5:12:35 P. M. and Dauntless at 5:22:55, the yachts held on down the Long Island shore with barely a breath of air and by 7 P. M. there was a calm on the water. In company with Genesta, now a mile ahead, was the tug Ocean King, chartered by the New York dailies and freighted with a valuable assorted cargo of reporters. By 9 P. M. there was a light wind from southeast, and Genesta moved faster under it, soon increasing the space between her and the schooner. The night was clear and calm and the sea perfectly smooth. It was nearly midnight before Fire Island lights fairly on Genesta's beam. Toward morning the wind drew ahead and compelled the schooner to make a tack; at 2:30 she stood off shore on port tack, going about again at 3:15, while Genesta held her first course until 4:10, when she too went on port tack until 4:37. Again at 5:10 Genesta tacks off in the gray and cloudy dawn. At 2 P. M. a light rain began to fall. It increased as the afternoon passed, and when at 5 P. M. Genesta passed Montauk Point, it was raining hard with a good breeze from the east. At 5:30 Block Island light was in sight, but the wind had lightened and the yacht moved very slowly. Dauntless was now far astern, not passing Montauk Point until 9 P. M. and sighting Block Island light at 9:45. It was 7:30 when Genesta sighted Point Judith light and 8:40 when she had it abeam.

At 9:38:50 she luffed around Brenton's Reef lightship, having finished half her journey in 28h., 26m., 15s. The sea was now rising and there was felt the first of the cyclone from the northwest that was so severe along the coast next day. At 10:15 Genesta again passed Point Judith, and at 11:20 the lights of the Dauntless were passed as she hurried on to windward to the mark. A little before midnight, between Block Island and Point Judith, she lost her jibboom, but saved the sail without damage. It was 1:24 A. M. when she luffed around the mark, 3.45.10 astern of Genesta, her time being 32 11.25.

The wind was increasing when Genesta came up to Montauk Point at 12:25 A. M. on Wednesday, and was now west-northwest. Her jibtopsail had already carried away. As the gale increases her sprit topsail comes down, and finally at 4 A. M. her topmast is housed. At 4:10 she made a tack inshore, and an hour later Shinnecock was sighted. The wind was now howling and a good sea running, so at 5:30 she hove to for a reef in the mainsail and to set No. 3 jib. It was expected that wind would soon lighten, or the trysail would have been set at once for the homeward trip. About the same time Dauntless, far astern, had also double-reefed her mainsail and foresail and stowed her jib. A little after 6 A. M. Genesta reefed her bowsprit and shifted to No. 4 jib, and at 6:50 she tacked inshore, into calmer water. At 8:20 she had Shinnecock abeam.

A little later than this Dauntless, when near Montauk Point, had carried away her foresail, being obliged to take it in for repairs. When nearing Shinnecock at 1:30 she set it again, and once more it carried away, leaving her under two reefed mainsail, forestaysail and jib. Off Fire Island at 11:00 A. M., Genesta ran into heavier water, while the wind was now blowing 60 miles per hour, as registered on shore. Again she hove to for a second reef. While it was being tied in a sea struck her and threw two of her crew to the deck, stunning one badly and spraining an ankle of the other who nearly went overboard. Now she went on easier, but the seas were still very heavy and the wind as strong, so at 2 P. M. a third reef was turned in. No pennant was now off, and the man who ventured out on the boom had some difficulty in passing one, but finally he succeeded, and the points are tied on, the boat going along more easily. At 3:45 she passed Long Beach Hotel, and at 4:40 the first sight of the Lightship was caught from the Ocean King, that had stuck by her bravely all the way. Dauntless had only passed Shinnecock at 1:57, setting foretrysail an hour later. When she was abreast of Fire Island, Genesta was just at the finish. It was 5:19:40 P. M. on Wednesday when she crossed the line, her elapsed time being 48h. 7m. 5s. After some trouble and danger, owing to the heavy sea, Genesta took the hawser of the Ocean King and was towed up to her anchorage. As she was taking in her jib one of the crew was struck heavily by a flying chain and wounded in the head.

At 9:55 the Highland Lights were in view from the Dauntless, and at 11:16:42 she crossed the line, taking her own time. The elapsed time was 53.54.42, or 5.48.12 longer than Genesta The latter had gained 3.45.10 in the drift out, and had increased this by 2h. 3m. 2s. on the beat home in a gale. Genesta sustained no injury beyond the loss of her jibtopsail, but Dauntless was towed to Poillon's yard for repairs.

SEPT. 26—SANDY HOOK AND CAPE MAY.

Again there were no entries but Genesta and Dauntless, though the weather promised to be very different from that of Wednesday. Both yachts sailed out on Saturday morning, and at 4:30 P. M. were ready at Buoy 5, while with them were Vision, Mischief and Esperito. The Luckenbach was also on hand, this time in charge of a party of reporters with the regatta committee also on board.

At 3:47 the preparatory signal blew and at 3:57 the start, Genesta going over as it sounded, at 3:57:15 and Dauntless followed at 3:58:30, both standing on starboard tack, heading southeast by east, with a light southerly wind. Genesta carried jibheader and jibtopsail and Dauntless sent up balloon jibtopsail with jibheaders and maintopmaststaysail. The regatta committee were placed on board the Scandinavian and the Luckenbach started after Genesta. Down the beach in the gathering darkness the two boats went, with a light wind and smooth water, making long legs on and off shore. At 1 A. M. Genesta passed Barnegat, making good speed in the light air. At 7:50 A. M. the steamer City of Atlanta passed by, bound north. The Luckenbach left her for a time and ran north in search of Dauntless, but she could not be found, and by noon the tug was again near Genesta, with the Northern Lightship only five miles distant. At 1:30 the tug neared the lightship, hoping for news of Dauntless, but no yacht had been sighted.

Genesta worked down to the weather mark, the Five Fathom Light-

ship, and at 3:55:23 she rounded it, setting spinnaker to starboard, and started home. About 5:30 she passed Dauntless, the latter with clubtopsail and maintopmaststaysail but no foretopmast. When near Aboseom at 6:30 the southerly wind died out, leaving a calm for a couple of hours, after which came a light breeze from northwest. Through the night she continued her course without any special incident, the wind drawing to the north and northeast toward morning, making a beat home. At 9 A. M. she was abreast of Seabright, traveling very fast with a good northeast breeze that heeled her down. An hour later she was at the line, winning her third race at 10:11:55, the time being 42.14.40. After she finished she sent up the white burgee with three winning flags under it. The Luckenbach passed her a line and towed her up to her anchorage.

Dauntless had the wind very light, but at 1:20 A. M. on Sunday her foretopmast carried away, owing to the breaking of the backstay bolt in the deck. She turned the outer mark at 10:10 on Sunday night, and after a tedious sail up the beach finished at 3:20 on Tuesday morning.

The full times are:

	Start, Sept. 26.	Finish.	Elapsed.
Genesta	3 57 15 P. M.	10 11 55 A. M. Sept. 27	42 14 40
Dauntless	3 58 20 P. M.	3 20 10 A. M. Sept. 28	59 21 14

LENGTH AND DEPTH IN A SEA.

THE value of length, depth and ballast when properly combined is well shown in the performance of Queen Mab, Watson's latest and most extreme 10, in the regatta at Dartmouth last month, where she raced successfully against such boats as Vanessa and Quickstep, beating them twenty minutes in a gale and heavy sea. Queen Mab is a 10-tonner of the modern type, 55ft. over all, 49ft. stem to sternpost on deck, about 47ft. waterline, 7ft. 4in. beam, with 13 tons of lead outside. Vanessa, the famous old racing 10, is 47ft. waterline, 9ft. 6in. beam. Quickstep, also 10 tons, is 46ft.x10ft.; Rondo 47ft.x10ft. 10in.; Butterfly, 47ft.x9ft 10in , all 20-ton racers of ten years since, and first-class of their kind. Queen Mab in this case gained no advantage from the Y. R. A. rule, as the 20s were in class C and she had to race in class A at a nominal rating of 40 tons, or double their tonnage. In spite of such a handicap, in a heavy E.N.E. breeze and a big sea running, the narrow boat left the wider ones easily, they holding her down wind, but once with sheets in she made 19min. even time on the foremost of her rivals, going easily through the seas and astonishing all the spectators. Besides the 20s, Irex and Marjorie were sailing a match at the same time, and the performance in a seaway of the little 10 compared with these big ones was noted favorably by all who saw it.

SLOOP OR CUTTER.

To the Editor of the Chronicle:

The keen interest with which so many here, whether yachtsmen or not, have read the reports of the Puritan-Genesta races have also provoked a great deal of criticism as to their respective builds and rigs, and on the lesson to be learned from the result. In two thoroughly fair trials under widely dissimilar conditions the Puritan won, proving that Americans can build and rig a centerboard cutter to beat a keel, and that is all. If Americans can derive any satisfaction from that feat it is theirs. It appears to me to be very little to be proud of, considering the claims that they make and the respective positions of keels and centerboards in American regattas. One thing is clear, they were afraid to trust to a sloop to meet the cutter. By their actions in these races they have set the following problems for solution before settling finally which country can claim the honor of building the fastest yachts:

First—A series of races between the Puritan and an English centerboard cutter.

Second—A series of races between the Genesta and an American keel cutter.

Third—A series of races between a *bona fide* American sloop rigged keel sloop, such as you will find by hundreds in American waters, and an English cutter of which there are thousands in England.

But Americans strenuously assert that the Puritan is a typical American sloop, and they try to prove it in this way: She was designed, built, sparred and rigged by Americans; her model is broader and shallower than the English; she has a centerboard and a stationary bowsprit. These are the essential points that distinguish the typical American sloop from all other boats.

The minor points, or non-essential, as I shall enumerate, are copied direct from English yachts, but do not affect the classification of a yacht if American papers are correct in their contentions.

The rank rake of the sternpost, the overhanging counter and outside ballast. The complete English cutter rig in its entirety, length of mast and set. The long gaff, mainsail with low hoist and high peak, foretopsail and jib, square head topsail, and all the kites.

I will venture to say the Puritan is the first typical American sloop of such a build and rig, and if Americans are right in their claims as to minor points, as a logical sequence a "schooner-rigged catamaran sloop" will be among the possibilities of the future, with a typical English sloop-rigged centerboard cutter for variety.

I have no wish to detract from the splendid success of the Puritan, but to coolly appropriate the English methods and cutter rig, and calmly claim the resulting yacht as typical American, and their race a centerboard against a keel when they have special classes for the two in their own regattas, is, to say the least, not thoroughly sportsmanlike or hardly fair.—*Aurus in Halifax Chronicle, Sept.* 21.

Now that the spray has been allowed to settle back into the ocean around the Scotland and Sandy Hook lightships, allow me to congratulate the cutter men on the unqualified triumph of their theories. Where in all the world is there a shingle-bottom capable of sailing on and off the wind as Puritan and Genesta have done?

The gentlemen who held forth so eloquently on the subject of sloops have crossed Al Sirat and are safe in Paradise, fondly imagining that the former was a sloop, a most fortuitous circumstance, while those who took pains to study Mr. Burgess's ideas intelligently saw at a glance that he was of the cutter persuasion, but found himself compelled by the necessities of the case to introduce certain modifications which have heretofore existed only in the sloop and schooner models. Puritan has the bowsprit and doublehead sail of a cutter—with this advantage, which her designer has slyly introduced as a sloop feature, the stick is built in and does not sleeve as in the cutter. The overhang of her stern, the straight or nearly straight line of her stem, especially in the freeboard, and the cut of her mainsail, is that of a cutter. In the light winds which prevailed, no doubt the lacing on h-r boom was an advantage; but in a solid breeze it would not have been. It is a sloop and catboat feature, originating in the Sound as the centerboard did, and destined eventually to go back there, consigned to a long sleep in those placid haunts where the memory of the Mystery (suggestive name) reminds us of the danger which lurks in lazy sailing, even in "still waters."

I am sorry the Genesta did not win the second race, not because I am at all unpatriotic, but solely for the real interest of yachting. Now, for a season or two we shall have all sorts of visionary compromise cutters, and it will take two or three years to educate the average experimenter into a practical yachtsman. Every one will learn at last that compromise boats are unsatisfactory in the long run, and that deep keels are really "the only wear" for genuine yachting. Next summer I hope Galatea, Vanduara and Irex, or Wendur and Marjorie will come over on their own bilges, as Genesta did, and between them capture the ugly mug. DEJA.

AN ENGLISH VIEW OF THE RACES.

IN an editorial under the heading of "The America's Cup" the London *Field* of Sept. 19 reviews as follows the late races. The *Field* also publishes a picture of Puritan, to which the following remarks are appended: "It will be seen that Puritan is a cutter, pure and simple, although her mast is stepped a little further forward than is usual in England, and the bowsprit will not reef in, as is customary on this side of the Atlantic. The mainsail is laced to the boom, and this has often been done in England in cutters; but a belief prevails here that better effects are got out of loose-footed sails. This much is certain, that if the sail bags much, hauling out on the foot takes the bag out much more effectively if the sail is not laced, and on the whole a loose-footed will sit better than a laced sail. On the other hand, if the sail is laced, the boom can be lighter, as the strain is more equally distributed. * * * It is plain that Puritan is no more the typical American centerboard sloop than Genesta is, and this is satisfactory, because it will probably induce American yachtsmen to abandon a type of boat universally condemned. That beam is not incompatible with good seagoing qualities was made pretty plain at the recent Dartmouth regatta by the performance of the yawl Constance, which went as fast and as well as anything in the race, [Constance is 86 9 stem to sternpost on deck, by 18ft. beam, or 3ft. wider than Genesta on the same length nearly.—ED F. & S.] and if the success of Puritan only reconciles British yachtsmen to the adoption of a little more beam, we shall have as much reason to be satisfied with the achievements of Puritan as the Americans have." The *Field* comments editorially on the race as follows:

"For the third time an Englishman has made an attempt to regain the cup won by the America in the regatta of the Royal Yacht Squadron in 1851, and failed. So far, however, as the failure of the Genesta goes, there is nothing to be disheartened about, and much to learn. In 1870 the American yachts had rather an easy victory over the Cambria when she started against the whole fleet of the New York Y. C.; and the decisive defeat which she subsequently bestowed upon one of their crack schooners—the Idler—in a jib-headed topsail breeze, failed to convince Americans that their shallow type of yacht would be any better for a little more depth of body. From an American point of view, the successive defeats of the Livonia in 1871 only confirmed the opinion that the shallow type of yacht could not be improved upon for speed and weatherliness, so far at least as smooth water sailing goes; and the subsequent attempts to win the cup by Canadian yachtsmen were of little interest from an English point of view.

"However, in 1881, an event occurred which created a great change of opinion in America as to the relative merits of the broad and shallow and deep and narrow type of yacht. Between the years 1870 and 1880 a notable advance had been made in the mode of ballasting English yachts, by tranferring the lead ballast from inside the hull to outside under the keel. By these means a yacht, say 80ft. loadline and 15ft. beam (5.33 beams to length) could be made to carry the sail of another of similar length, but with 20ft. beam (4 beams to length); but one would be rated as of 80 tons and the other as of 110 tons. Unfortunately the advantages seemed so much in favor of the narrower vessel that no one ventured to build one of the broader type, and so all our experiments were in one direction; and there is no doubt that the objects sought by the designer were attained with fewer failures than experiments with broader vessels in America. Beyond this, here was the solid fact that, no matter how narrow the English yacht is, she can be sailed in any kind of weather and sea; and as much cannot be said for the broad and shallow yachts of America. All these things had been marked by the more observant of American yachtsmen, and were freely discussed in a portion of the New York press; but the recollection of the successive defeats of the Cambria and Livonia formed a bulwark which no amount of argument could surmount. At length, in 1881, the event to which we have referred occurred; that is, Mr. James Coats, one of our most staunch and enterprising yachtsmen, took the 10-tonner Madge to New York for the purpose of gauging the two types. The decisive victories of the Madge came as a revelation to American yachtsmen, and the advocates of the narrow-beamed craft were so elated that one of the papers suggested that 'if they were not hooped they would bust.' We at the time wrote, 'Fortunately American yachtsmen are not likely to lose their senses over the victories of the Madge, and while probably their present type of yacht will undergo considerable modification, it is improbable that they will adopt suddenly the modern British type; at the same time, it is to be hoped that they will not attempt to get on terms with the British model by simply cutting deep, heavy lead keels on their broad shallow yachts. Of course the yachts would be improved by deep lead keels, but an alteration in the type is required by dispensing with a little breadth and giving more under-water depth of body.'

"This exactly describes what American yachtsmen have been doing during the last four years; and to foster a type of vessels with moderate beam and unrestricted depth, they adopted the "sail area and length rule," in place of the old bulk rule, which had for some years been used by the New York Y. C. Of course when yacht building is in a transition state, there is not likely to be any vessel of distinct excellence produced; and on the arrival of the challenge from the owner of the Genesta, the members of the New York Y. C., on scanning over their fleet of yachts, came to the conclusion that not one existed fit to tackle the British craft. It is true they had the Bedouin of 66 Y. R. A. tons, a good hard weather boat, but no better than their crack sloop Gracie in moderate weather, and moreover, there was from a national point of view the objection that Bedouin was designed by an Englishman (Mr. John Harvey), and although of only four and a half beams in length, she is in every respect an English type of cutter.

"Under these circumstances Mr. Gordon Bennett and Mr. W. Douglas commissioned Mr. Cary Smith, a very successful naval architect, to design a sloop at least equal in length to the Genesta, and while retaining most of the features of the American type, to modify them as circumstances seemed to require; the result was the Priscilla. At the same time Mr. J. Malcolm Forbes, one of the best known and appreciative yachtsmen of Boston, accepted a design made by Mr. E. Burgess. The latter in one sense is an amateur, as three years ago he held a position in the Boston Society of Natural History, and only adopted yacht designing after a long correspondence with English yacht designers and a visit to English yachting stations. At any rate there is no doubt that in the Puritan he has produced a masterpiece, whether we regard her speed and weatherly qualities or her 'looks.' The engraving in our yachting columns is taken from a photograph, and while it conveys a correct impression of the vessel's appearance, does justice to a very symmetrical-looking hull.

"Our special correspondent ably described the characteristics of Puritan in the letter we published last week; and from is description it will be gathered that she is a craft midway, as it were, between an English cutter and an American sloop. Her length of waterline is 80ft., her beam 23ft., her draught of water 8ft. 3in., and her displacement 120 tons. She is fitted with a lead keel of 25 tons, and has 20 tons of lead inside. She has a centerboard, but this probably was fitted in deference to the *amour propre* of Americans; she might otherwise have had a much deeper keel and have carried her lead lower. However, this opens the question of immersed surface, and it would be out of place to discuss such a matter here. As already described in our columns, trial races between Puritan, Priscilla, Gracie and Bedouin took place, and the final selection fell on Puritan, although there was not much to choose between her and the Priscilla, both, however, being incomparably better than Gracie or Bedouin.

"The sail area rule, as used by the New York Y. C. is this: to the square root of the sail area add twice the length on the load water line and divide by three; the rating is thus by length. By this rule Puritan is 83.85ft. and Genesta 83.5ft.; their actual length on the waterline being 80ft. and 81ft. respectively. Thus, the sail area of Puritan be must 8382sq. ft. and that of Genesta 7833sq. ft., the excess in favor of Puritan being 549sq. ft., quite sufficient to give her an advantage in light winds, and in fresh winds either, provided there was not much sea, when her want of depth of body might tell against her. So far as the match sailed on Monday goes, there seems to be little doubt that Puritan held Genesta safe all day in the light wind, but the long distance by time (16 minutes) at the finish was no doubt due to the wind dying out to a mere sigh at the end, rendering it very tedious work getting through the water.

"The match on Wednesday was sailed in a better breeze, which the landsman who telegraphs the result to the London papers magnifies into a gale, although Genesta brought her big topsail home all through the long beat of twenty miles. That it must have been very close work is evident from the time at the finish, which in this case seems reliable, although the 'roundness' of the figures telegraphed across from New York concerning Monday's match is suggestive of the sundial. It would be premature to form any conclusions as to the relative merits of the two types as represented by Genesta and Puritan; but this much seems certain, that yachtsmen on this side of the Atlantic have been blindly prejudiced in favor of 'all length and no beam,' in consequence of the Thames and Y. R. A. tonnage rules being the sole standard test of merit. But, even judging by those rules, it would now seem evident that, for any given length, a good vessel of four and three-quarter beams could give the Y. R. A. time to one of five and a half beams. Puritan has only three and a half beams to length, and by the Y. R. A. rules would be 141 tons against Genesta's 80 tons, equal to 9min. 25sec. over a 40-mile course, and it appears to be clearly established that by this rule Puritan would have no chance against Genesta. On the other hand, by the displacement rule under which the Livonia sailed in America in 1871, the Genesta would allow Puritan two or three minutes. Under the Y. R. A. sail area rule Genesta would be 106 tons and Puritan 112 tons, and the allowance on a course of 40 miles would be 57sec., and this allowance would not be far wrong for whole sail breezes.

"A question has been mooted on this side of the Atlantic as to whether Genesta is the best of our late fleet of cutters. Perhaps she is not; indeed, many of our good judges would sooner pin their faith on Irex or Marjorie, or even Marguerite in a very light wind; but it must be evident to every one that, with the additional lead put outside Genesta during the winter, and her increased sail spread, she must be very near Irex in speed, and perhaps her equal by the wind. At any rate, all yachtsmen can confidently regard Genesta as a representative cutter, and good enough in all respects to test the qualities of the yachts of America. Until we get full reports from our special correspondent we can withhold our judgment as to the merits of the two tests just now completed, although we cannot get over the fact that the Genesta has failed to recover the America Cup. There are other matches for which she is entered, notably the Brenton Reef and the Cape May challenge cups, and it is much to be regretted that the Puritan is not also entered for these races, as the contests already sailed cannot from all points of view be regarded as conclusive; and, moreover, we all should like to see the English craft have the opportunity of returning a Roland for an Oliver."

A GALE AMONG THE YACHTS.—The heavy gale of last week did considerable damage to the yachts in the bay, the most serious injury being to the centerboard sloop Sagitta, Mr. Henry C. Ward, N. Y. Y. C., which was driven ashore on Debb's Inlet Shoal near Rockaway on Wednesday morning, giving rise to the report that Genesta was aground. The Sagitta, in charge of Captain Smith, left Gravesend Bay at 1:30 A. M., bound for Fire Island to lay up, and at 3:30 she went ashore off Far Rockaway, in consequence of the loss of her mainsail, which was double-reefed at the time. Captain Smith and his crew of two were rescued by the boat from Life Saving Station No. 34, commanded by Captain John H. Abrams. After the gale subsided she was lightened and hauled off, sustaining little serious damage. At Bay Ridge the Crocodile, Wivern, Comet, Florence, Caprice, Breeze and several others went ashore, but none were very seriously injured.

OPEN REGATTA AT MATTAPOISETT.—The annual open regatta was sailed at Mattapoisett on Sept. 12, there being four classes of catboats. The courses for first and second class were 13½ miles, and for third and fourth class 10 miles. The starters and times were:

FIRST CLASS—OVER 23FT.

	Actual.	Corrected.
Surprise, J. Codman	2 42 36	2 38 55
Quissett, Isaac Hiller	2 40 44	2 39 26
Mary, G. E. Phinney	2 43 08	2 43 08
Mattie, Howard Stockton	2 46 00	2 45 03
Myth, Thomas Parsons	2 50 02	2 45 32
Cadmus, H. E. Perry	2 50 08	2 45 26
Almira, J. T. Phinney	2 49 38	2 48 30

SECOND CLASS—20 TO 23FT.

Zillah, Jabez Jenney	3 04 43	3 03 59
Tantrum, C. C. Handy	3 05 03	3 04 02
Gleam, E. H. Storms	3 10 51	3 10 51
Lady of the Lake, F. A. Bowman	3 16 15	3 14 13

THIRD CLASS—15 TO 20FT.

Mystic, B. R. & L. Frothingham	1 17 38	1 16 18
Spray, J. Friedhoff	1 24 50	1 24 50
Gem, S. A. Bigelow	1 27 42	1 25 40
Gladys, S. Warren, Jr.	1 32 29	1 28 04

FOURTH CLASS—UNDER 15FT.

J. T. Sampson	1 37 21	1 37 21
Lewis Bacon	1 45 48	1 40 19
Sylvanus Swift	1 43 47	1 41 37

Regatta committee—E. B. Gifford, Robert Atkinson, R. F. Holmes and Ansel Hardy. Holmes and Hardy were the judges and M. G. H. Dexter measurer.

NEWARK Y. C.—This club sailed their open sweep takes regatta on Monday over a ten-mile course, twice around a five-mile triangle, off Greenville in Newark Bay. The summary is as follows:

CLASS 1—CABIN SLOOPS.

	Start.	Finish.	Elapsed.	Corrected.
Winifred	12 42 00	2 49 00	2 07 00	2 07 30
Vixen	12 42 00	2 49 30	2 07 30	2 07 00
Lydia F	12 42 00	2 08 15	2 26 15	2 22 22

CLASS 2—JIB AND MAINSAIL, OVER 18FT.

Eliza	12 33 00	2 38 30	2 05 30	2 05 30
Rambler	12 35 45	2 49 15	2 13 30	2 10 02
Just Woke Up	12 35 50	2 30 55	1 55 05	1 49 22
Maud F	12 34 05	2 38 00	2 03 55	1 56 10
Fern	12 37 00	3 00 55	2 23 55	2 14 48

CLASS 4—CATBOATS, OVER 18FT.

Blavi B	12 24 50	3 04 15	2 39 25	2 39 25
Shadow	12 24 30	3 05 00	2 40 30	2 39 15
Triton	12 24 15	3 08 15	2 43 50	2 42 50
Teaser	12 24 45	2 40 00	2 15 15	2 12 52
Ripple	12 26 15	2 57 00	2 31 50	2 33 00

CLASS 5—CATBOATS, 18FT. AND UNDER.

Tillie	12 18 45	2 54 30	2 35 45	2 35 16
Niack	12 20 30	3 09 50	2 49 29	2 47 07
Marion	12 19 15	3 10 15	2 51 00	2 49 45
Fleetwing	12 22 00	2 55 45	2 33 45	2 33 45

Just Woke Up wins the silver pitcher for best time over the course. The owner of Emmy C. fainted just as the boat was at the starting line and she was withdrawn.

OSHKOSH Y. C. STEAM YACHT RACE.—*Editor Forest and Stream:* On Sept. 19 a large crowd assembled at the island, seven miles from Oshkosh on Lake Winnebago to witness a steam yacht race. There were five starters, the Albina, Maggie Leard, Coquette, Farrand and Annie. The race was a handicap, the Farrand and Coquette starting three minutes and fifty-eight seconds behind the Albina and Maggie Leard, and the Annie seven minutes and thirty seconds behind. The Albina was the first to arrive at finish, the Farrand next and the Coquette following. The captain or the Farraud, not understanding the rules of the race passed inside the buoy rounding for home instead of outside and was set back ten seconds. The Annie, Geo. W. Peck's yacht, made the quickest time around the course, but was handicapped too heavily, and consequently came in fourth. The following table shows the time of start and finish, and the elapsed time:

	Start.	Finish.	Elapsed.
Albina	2 49 30	3 50 00	1 05 30
Coquette	2 53 28	3 57 05	1 03 37
Farrand	2 53 28	3 57 10	1 03 32
Annie	2 57 00	3 57 30	1 00 30
Maggie Leard	2 49 30	4 03 30	1 14 00

The corrected time of the Farrand make her finish 1:03:42, although it is claimed that the judges set her back too much for the little time she gained by going inside of the buoy. The lake was as smooth as a mirror, and a better day could not be picked out in a whole season. As the race had been postponed twice four other yachts did not put in an appearance.—MORTIMER.

HULL Y. C.—A championship race was sailed on Sept. 19 in a good breeze. The summary of times is as follows:

FIRST CLASS KEELS.

	Length.	Actual.	Corrected.
Hera, G. R. Howe	37.04	1 51 40	1 27 41

SECOND CLASS KEELS.

Banneret, J. F. Brown	35.02	1 56 54	1 21 49
Lizzie F. Daly, Wm. Daly, Jr.	26.11	1 57 42	1 21 36

THIRD CLASS KEELS.

Kitty, E. H. Tarbel	23.09	1 19 14	0 58 08
Thelga, A. P. Thayer	22.07	1 26 39	1 05 42

FOURTH CLASS.

Amy, E. W. Baxter	21 03	1 22 05	1 01 05
Joker, Geo. Coffin	20.08	1 22 53	1 00 24

SIXTH CLASS.

Elsie, C. F. Hardwick	16.10	1 38 00	1 11 49

Banneret has won 9 firsts and 2 seconds out of 11 starts this year, having beaten Lizzie F. Daly 7 times in 9 races. For the season, Hero wins in first class keels, Banneret in second class keels, Atalanta in second class centerboards, Queen Mab in third class boards, Kitty in third class keels, Amy wins in fourth class, Em Ell Eye in fifth and Elsie in sixth.

SLOOP RIG VS. CUTTER RIG FOR SINGLE-HANDED SAILING.—The matter appears to me to lie in a nutshell. For very narrow waters—such as the Upper Thames or the Norfolk rivers, or any lake less than a half a mile in breadth—one sail before the mast will, I consider, be found most convenient for either a yawl or any fore-and-aft-rigged sailing boat, for all who like any sail at all before the mast for narrow-water sailing, and do not prefer the cat or Una rig. Circumstances, however, alter cases, and, where you have to deal with wider waters, two sails are much more convenient, as, instead of shifting canvas if the wind freshens, you merely lower your staysail, and thereby take much of the pressure off the head of the boat. Where there is sea room, so to speak, the additional pair of sheets is of little consequence. Nearly the whole of the larger boats used by watermen here are yawls, and the convenience of having two head sails is seen daily, particularly in sailing for mackerel, in which these boats in a fresh wind use only their jib and mainsail, answering perfectly with this canvas.—J. C. WILCOCKS (Plymouth, Sept. 14).—*London Field.*

TOLEDO Y. C., SEPT. 24.—A race was sailed on Sept. 24 over the club course of 21 miles by the three sloops Kate Graham, Scud and Crescent. The start was at 11:42, with five minutes to cross. Kate Graham crossed at 11:43:35, Scud 11:44:32, and Crescent 11:48:44, with 1.44 handicap. Reefed mainsails with spinnakers were carried on the first leg, Kate Graham also showing a topsail over her two-reefed mainsail. She led round the first mark at 12:36:35, with Scud at 12:39:51 and Crescent 12:50:10. Scud gained for a time on second leg, the times being: Kate Graham 1:30:04, Scud 1:30:40, Crescent 1:40:48. The last leg to windward saw Kate Graham still further ahead, winning by 7.11. The times were:

	Start.	Finish.	Elapsed	Corrected.
Kate Graham	11 43 35	3 22 55	3 39 20	3 36 32
Scud	11 44 32	3 28 15	3 43 43	3 43 43
Crescent	11 47 00	3 43 35	3 56 35	3 49 35

SOUTH BOSTON Y. C.—The last regatta of this club was sailed on Sept. 19 off City Point. The course for first class boats was 7¼ miles and for second class 5¾ miles. The times were:

FIRST CLASS KEELS.

Actual.	Corrected.		Actual.	Corrected.

TORONTO YACHTING.—On Sept. 26, a sealed handicap race was sailed by the Royal Canadian and the Toronto yacht clubs, the starters being: Aileen, Com. Leys, R.C.Y.C.; Oriole, Vice-Com. Gooderham, R.C.Y.C.; Verve, Rear-Com. Cochrane, R.C.Y.C.; Alarm, Mr. L. H. Robertson, R.C.Y.C.; Cygnet, Com. McGaw, T.Y.C.; Condor, A. Carmichael, T.Y.C.; Escape, Capt McIntosh, T.Y.C. At 1 P. M. all started in a southwest wind. In beating out Oriole carried away Condor's topmaststay with her main boom, and the latter withdrew. Owing to one buoy being misplaced, there was some difficulty in finding the course and a resail may be ordered. Oriole won in 3.43.05, with Cygnet 3.47.15 and Aileen 4 21.45 corrected time.

AN INGENIOUS TRANSFORMATION.—We noticed some time since a picture of Priscilla leading Puritan around the Lightship in the (then) coming trial races, painted by the eminent marine artist, Mr. Franklyn Bassford. Owing to a combination of unforeseen circumstances, the principal one being the extra speed of the Boston boat, the trial races did not terminate just in the way expected, and whatever its artistic merit, the historical value of the picture was somewhat impaired The artist, however, proved equal to the occasion, and the picture now graces a Nassau street window, but in a new guise. The leading boat (Priscilla) now has housed her topmast, her sheer and overhang are greater, and a broad white bulwark has been added, changing her into Puritan. The other boat, less plainly shown, has dropped her white coat for a black one, and with very slight alteration her stern does fairly well for Genesta. Of the artistic merits of the painting we do not feel competent to speak, but we can at least compliment Mr. Bassford on his ingenuity.

THE DINNER TO SIR RICHARD SUTTON.—On Monday week the New York Y. C. gave a dinner to Sir Richard Sutton, at the club house on Madison avenue, the repast being served by Delmonico, in the large model room of the club house. Sir William Levinge and Mr. J. Beavor-Webb were also present, besides a number of the club members. After dinner the various challenge cups were placed on the tables, prominent among them being the Brenton's Reef and Douglas Cups, which were presented to Sir Richard Sutton by Vice Commodore Douglas, who presided. A number of speeches and toasts followed, after which Sir Richard Sutton was unanimously elected an honorary member. On Saturday both he and Sir William Levinge sailed on the Etruria for Liverpool. Mr. Beavor-Webb will remain in New York for a few weeks. Those desiring to consult him in regard to sailing or steam yachts can address him at No. 7 Bowling Green, care of Anchor Line.

PURITAN.—Col. C. J. Paine, of Nahant, owner of the schooner Halcyon, is the purchaser of Puritan. Last Thursday she left New York and towed through the Gate for Marblehead. On her arrival at 3 A M. on Sunday she anchored quietly, but by daybreak her presence was made known on shore, and by noon hundreds of people from Salem, Beverly, Boston, Lynn, Swampscott, Nahant, and all the surrounding country were pouring into Marblehead on foot, in carriages and wagons, and in the horsecars, to see the victorious yacht. On Monday night a huge bonfire was built on Bartoll's Head and the town was enjoying a general jubilee. A dinner to Mr. Burgess and the owners of the Puritan will be given in Boston. Puritan will winter between the bridges at Beverly, going out of commission at once.

LAID UP FOR THE SEASON.—The South Boston *Inquirer* ends its yachting reports for the season as follows: Hurrah, Puritan! Hurrah, Burgess! Hurrah, Lawley! Hurrah, Crocker! Hurrah, South Boston! Hurrah, Everybody! Hull Y. C. regatta to-day. The yachting season is about over. After this date our yachting department will be suspended for the season.

A KEEL SLOOP FOR SALE.—In another column will be found an advertisement of the sloop Altaire, a fast keel boat that has raced very successfully in the South Boston Y. C. She will make a good boat either for cruising or racing.

A NEW MARINE GLASS.—A very convenient and powerful glass has lately been introduced by Norie & Wilson, 156 Minories, London, under the name of Regatta and Race glass. It is a 12 lense glass with bending bar, fitting it to any width between the eyes, and its compact shape makes it easy to carry and allows it to be held steadily on board a rolling vessel. The price, including case, is three guineas in England.

LLOYDS.—We have received the first supplement to "Lloyds Yacht Register," containing alterations and additions in the lists up to July 24, 1885. We have also received a very handsomely made book, the "Annals of Lloyds Register," a history of the society from its foundation, which we will notice at length shortly.

ACCIDENT TO THE PURITAN.—"That was a great gale yesterday," said Captain Burtis. "I was surprised to hear how quickly the yacht Puritan was knocked down." "Knocked down? I did not hear of it," said his surprised friend." "Yes, knocked down for $13,500. An auction gale, you know."—*New York Herald.*

BEVERLY Y. C.—The protest of Witch vs. Peri in Beverly Y. C., second championship race, July 25, is not allowed. That of Peri vs. Witch is allowed; this gives Fad first and Caprice second prize in second class keels. Protest Niobe vs. Zantho in the 106th regatta is not allowed.

Answers to Correspondents.

☞ **No Notice Taken of Anonymous Correspondents.**

B., Concord.—See article on Maine coast shooting in this week's issue.

B. J. B., Portland, Oregon.—Write to Brentano Brothers, Union Square, New York city.

C. S. M.—To bark a squirrel is to strike the bark or limb on which the squirrel is resting, in such a way that the shock of the concussion will kill it.

F. P., Newark, N. J.—For the Sunday shooting law apply to the New Jersey Fish and Game Protective Society, Geo. P. Suydam, counsel, Plainfield, N. J.

B. G., Galveston.—Where and at what price can I obtain the convex glass frames under which dead game is mounted. Ans. The frames are made by H. E. Chubb, Cleveland, O.

B. R, Penn Yan.—1. In using a .32-cal. rifle that is reamed for the extra long cartridge, could I, by using wads in the center fire shells, shoot any amount of powder I like? 2. How would round balls shoot in a shell loaded in that way? 3. Would it be advisable to use patches for either round or pointed balls? Ans. 1. You cannot get good shooting with shells that are too short for the chambers. You may, in the long shells, put a thin wad over powder, then fill up as necessary with bonedust. 2. As good as round balls in any weapon. 3. Yes, if properly applied.

D. G. M.—For black bass fishing go to Greenwood Lake. See note elsewhere, or go to Lake Hopatcong, N. J.

R. H. B.—In Michigan the open seasons for deer are: Lower Peninsula, Oct. 1-Dec 1; Upper Peninsula, Aug. 15-Nov. 15. Forbidden to export venison from the State.

A. F. D., Boston, Mass.—Will the correspondent signing himself "A. F. D." please send his address to this office. We do not print anonymous communications.

O. S. C.—Can you inform me where the purple grackle, commonly called crow blackbird, is a winter resident? Ans. You will find millions of them in the Gulf States in winter.

H. R. W., Columbus, O.—Black is not a mastiff color. The puppies will probably be brindle when mature. Send in their full pedigree and we can probably inform you as to the purity of their breeding.

R. H. D., Silver Cliff, Col.—I would like some information on the making of trout ponds, raising trout, etc. You will greatly oblige me and the neighborhood by sending me same. Ans. From your question we think you want a volume on trout culture. In former years we published many continued articles on this subject which were of interest in the early days of fishculture, but would not be so now. Get "Domesticated Trout," by Livingston Stone, price $2. We can furnish it.

H L F.—The Creedmoor targets are divided into three classes, of the following sizes: 1. Third Class—Used at all distances up to and including 300yds. Target, 4×6ft.; bullseye, 8in. diameter; center, 26; inner, 46; outer, remainder of target. 2. Second Class—Used at all distances over 300 to and including 600yds. Target, 6×6ft.; bullseye, 22in.; center, 38; inner, 54; outer, remainder of target. 3. First Class—Used at all distances over 600yds. Target, 6×12ft.; bullseye, 36in.; center, 54; inner, square, 6×6ft.; outer, remainder of target. The bullseye counts 5, center counts 4, inner counts 3, outer counts 2.

INFORMATION WANTED.

A. W. R. wants to know how to pickle eels, mussels and clams, for use on a cruise.

C. S. C. wants to know the best place on the Illinois River for duck shooting, and when will be the best time to go this fall.

AIR GUNS

PRICES: $6, $9, $10, $12, $15, $18 and $20.

FOR PROFIT AND PLEASURE.

The gun shown above is our **NEW COMBINATION AIR GUN.** This is the most complete arrangement ever offered. It combines two pieces in one (a perfect Rifle to shoot a regular .22-100 cartridge, and a superior Air Gun to shoot darts, slugs and shot). It can be instantly changed from one to the other, and has a steel barrel rifled. All the parts extra heavy, and so constructed of best material to stand continuous service, making the most durable gun manufactured, and by far the most practical long-range Air Gun ever made for gallery or field. WE MANUFACTURE A FULL ASSORTMENT OF AIR GUNS SUITED TO MEET THE TASTES AND WANTS OF EVERY ONE. The quality of our goods has established them in all the principal markets of the world, and their superiority has induced the United States Navy to place them, with success, on their school ships. ☞ Illustrated price lists sent upon application. H. M. QUACKENBUSH, Manufacturer, Herkimer, N. Y., U. S. A.
NOTE.—We stamp our name plainly on each gun we make. Send for catalogue B.

Canoe and Camp Cookery.

By "SENECA."

A practical cook book for canoeists, Corinthian sailors and outers. Practical because the author gives explicit and intelligible directions for preparing such dishes as he has himself actually tested in camp and on a cruise. This is just where the recipes differ from the absurdly impracticable dishes given in some so-called camp cookery books. The cooking outfit is described, and numerous hints on camp economy add to the value of the work. Cloth, 96 pages. Price $1.00.

SMALL YACHTS.

Their Design and Construction, Exemplified by the Ruling Types of Modern Practice.

By C. P. KUNHARDT.

The Forest and Stream Publishing Company takes pleasure in announcing the immediate publication of a magnificent folio volume, bearing the above title. This book is intended to cover the field of Small Yachts, with special regard to their design, construction, equipment and keep. The opening chapters are devoted to a consideration of the model and the draft, their relations to one another, and the purposes which they subserve. Full directions are given for producing the plans of a yacht with reference to the chief points in design, and the method of taking off the lines of a boat already built is likewise described in detail.

All elements entering into design, such as Resistance, Stability, Balance of Rig, Handiness, Displacement, etc., are dealt with in separate chapters. The rules necessary for the mathematical computations, and a review of theory and practice close the first division of the book.

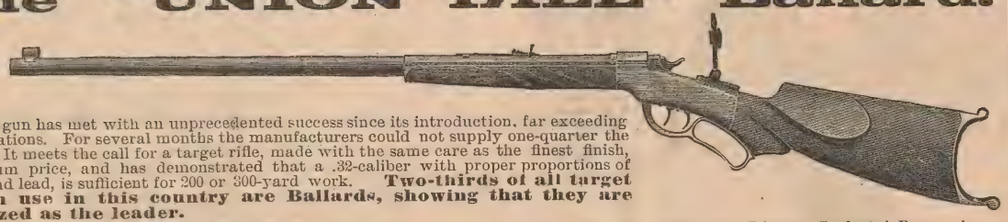
The second portion comprises the description of the Plates, covering the whole range of type in small yachts, from the shoal catboat and American centerboard sloop to examples of the narrowest and deepest British cutter yet built. These yachts have their lines, build and fittings depicted in the Plates, which are drawn to scale. With their aid and the specifications presented, the reader is placed in possession of accurate information concerning the mould, accommodations, rig and characteristics of all styles of yachts which have received favorable recognition. Sporting boats, combination row and sailboats, and various examples of special form are introduced.

The third division offers a comprehensive review of single-hand sailing, to which small yachts are especially adapted. Directions are given as a guide in selection of type and sail plan, and subsequent equipment and proper management.

The iron work of yachts, their gear, yawls, steering apparatus, boat building and much other closely related matter is entered upon. The new International Rules of the Road, Signal Service, and a bibliography appear in the Appendix.

The work is profusely and handsomely illustrated with 150 illustrations inserted in the text, besides the sixty-three plates as follows:

LIST OF PLATES.



I. The Sloop Yacht Schemer.
II. The Nuckel.
III. The Windward.
IV. A Newport Catboat—Portable Catboat.

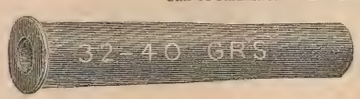
Pages 370, with 136 plate pages additional, or a total of more than 500.

Now Ready. Price, postpaid, $7.00.



New York: FOREST AND STREAM PUBLISHING CO., 39 Park Row. London: SAMSON, LOW, MARSTON & CO., 188 Fleet Street.

The "UNION HILL" Ballard.

This gun has met with an unprecedented success since its introduction, far exceeding all expectations. For several months the manufacturers could not supply one-quarter the demand. It meets the call for a target rifle, made with the same care as the finest finish, at a medium price, and has demonstrated that a .32-caliber with proper proportions of powder and lead, is sufficient for 200 or 300-yard work. **Two-thirds of all target rifles in use in this country are Ballards, showing that they are recognized as the leader.**

Prices: No. 8.—Half Octagon Barrel, Pistol Grip Stock, Cheek Piece, Nickeled, Off-Hand Butt Plate, Double Set Triggers, Graduated Peep and Globe Sights, 9½lbs., 28 and 30 inches..... $37 50
No. 9.—Same, but with Single Trigger..... 33 00
Can be furnished with Vernier's Mid-Range and Wind Gauge Front Sights for $6.50 extra.

"FOREST AND STREAM SERIES."

DEER HUNTING.

BY JUDGE JOHN DEAN CATON.

BY and by it will be time to hunt antelope and deer. It is always time to read about them. Judge Caton's book on the antelope, elk, deer, moose and caribou of America discusses in a readable way the life history of these animals and the methods of their capture. It is the work of an enthusiastic sportsman who has had a wide experience and has devoted the leisure of years to studying these interesting game animals. The volume is very fully illustrated, and is a perfect storehouse of information and entertainment. The first edition was sold by the Boston publishers at $4. Price $2.50.

WOODCRAFT.

BY "NESSMUK."

A COMPACT pocket handbook of condensed, boiled-down, concise, clear, comprehensive, sensible, practical camp gumption. "Nessmuk" has been "in the woods" in Michigan, New York, Pennsylvania, and South America, and this is a book for outers, wherever they kindle their camp-fire. The author believes in "smoothing it." He has learned how; now he tells others. It is much easier to learn from "Nessmuk" than from Dame Experience. We should not be surprised if "Woodcraft" completely revolutionized the methods of camping out. If you are going to the woods, read "Woodcraft" before you go. It may add to your trip a hundred fold. Price $1.00.

DOG TRAINING.

BY S. T. HAMMOND.

HE was a promising puppy, and when you turned him over to the breaker to be educated, you thought he was bound to make "the best dog in the world." And you'll not soon forget how disappointed and disgusted you were when the dog, the breaker and the big bill—all three turned up together, and you saw that the animal's spirit was broken and it would take a steam calliope to make him mind. Now, this could not have happened if you had been wise enough to buy a copy of Hammond's book, and in your odd leisure moments *train* the dog yourself instead of having him *broken* by some one else. We are selling edition after edition of this book, and it is revolutionizing the system of preparing dogs for work in the field. Price $1.00.

SHORE BIRDS.

A PAMPHLET for those who "gun" along the shore. Tells of: I. Haunts and Habits—Where the bay birds live and what they do at home. II. Range and Migration—Where they go to breed and where to spend the winter. III. A Morning Without the Birds—An episode of shore shooting. IV. Nomenclature—A list of our American species of *Limicolæ*, with a description of each species. V. Localities—Where to go to shoot them. VI. Blinds and Decoys—How to shoot them after you have reached the grounds. 45 pp., paper. Price 15 cents.

ANGLING TALKS.

BY GEORGE DAWSON.

AS a political writer of conceded power, Mr. Dawson wielded a trenchant pen; when he turned from the conflict of parties to the praise of the favorite pastime of "simple wise men," his essays, limpid as the crystal streams, are aglow with the soft summer sunlight and melodious with the songs of birds. When angling was the theme, he wrote from a full heart and in closest sympathy with the scenes and pursuits described. These "Talks" are brimful of manly, wholesome sentiment; there is in them all not a particle of cant. Their sincerity and overflowing spirit at once win the reader, and he perforce shares the author's enthusiasm. The effect is magical, like that of the mimic players in Xenophon's *Memorabilia:* he who reads, if he be an angler, must go a-fishing; and if he be not, straightway then must he become one.—*Extract from Publishers' Preface.* Cloth, price 50 cents.

CANOE "AURORA."

BY DR. C. A. NEIDÉ.

A CHARMINGLY written and always entertaining account of a canoe cruise from Lake George, New York, down the Ohio and Mississippi Rivers to the Gulf of Mexico, by the Secretary of the American Canoe Association. To read the cruise of the "Aurora" is the next best thing to having made it; and the reading is decidedly more pleasant than would have been participation in some of the misadventures related. 216 pp., cloth. Price $1.00.

Any of the above books can be obtained in London of Davies & Co., 1 Finch Lane, Cornhill.

F. A. ALLEN'S SPECIALTIES.

MONMOUTH, ILL.

ALLEN'S DUCK CALL—Improved, Nickel Plated; the most natural-toned, easiest-blowing, smallest and only Metal Duck Call ever invented and the only one that perfectly imitates the *wild* duck. Sent by mail on receipt of $1.

ALLEN'S BOW-FACING OARS—Can be attached to any boat in five minutes, shipped instantly in the roughest water; work much easier than the common oar. In duck shooting they are invaluable; you see the bird the instant it leaves the water. Sent by express on receipt of $8.

ALLEN'S SHELL SWAGE—Will reduce brass shells to their original size in one-half minute, making them as smooth and solid as when new. On ordering mention gauge wanted. Sent by express for $1; by mail $1.30.

ALLEN'S DECOY DUCK FRAME—Is a simple device for holding the dead duck in a natural position in the water. Price $4 per doz. **SEND FOR CATALOGUE FREE.**

CANOE

THE FOREST AND STREAM began a year ago the publication of a series of papers on canoe construction, by Mr. W. P. Stephens, of the New York C. C., widely known as an expert on canoe design and building. These papers, having appeared through the year in our columns, have since been rewritten, and with numerous additions are now published in a handsome volume under the title of "Canoe and Boat Building for Amateurs." Mr. Stephens is peculiarly fitted for the preparation of such a work, beginning as an amateur, and having after a long experience of the difficulties attending a learner, taken a prominent place among canoe builders, due both to the model and workmanship of his canoes. Realizing fully the difficulty of explaining to a novice an art in itself far from easy,

AND

and with which he is entirely unfamiliar, the book begins with a description of the various classes of canoes in general use, with their main features and dimensions, and definitions of the terms used in connection with them. Numerous examples of canoes are given, and in connection with them, such plain instructions in designing as will enable the beginner to select intelligently the proper craft for his pur-

BOAT

pose, and to plan her dimensions, details and fittings. To this end designs of all classes of canoes are given, with full dimensions and details. The object has been not merely to enable the tyro to build one boat as described, but to teach him the principles of designing and building in such a way that he may construct such a craft as he desires, following the chapters on designing, the construction of a canoe is taken up in detail, the tools and appliances being first clearly described, as well as the various materials, after which follows the actual work of building. Every operation is taken up in order, from the selection of the keel to the varnishing of the finished boat, and illustrated with numerous diagrams.

A chapter on sails describes all the varieties in use by canoeists, down to the new Mohican sertee, with directions for making, rigging and measuring them, while the method of proportioning the sails to the boat is clearly explained, all the calculations

BUILDING

being worked out in detail. The many minor points of a canoe, paddles, steering gears, rudders, aprons, and canap outfit are also described at length, while a chapter is devoted to canvas canoes.

The subject of boat building is fully treated, a rowboat of the usual construction being taken as an example, and described in all its parts in such a manner as to make clear the principles involved, and their application to any form of boat, either lapstreak or carvel build. Each of the numerous technical terms belonging to the subject is defined clearly when it first occurs, and as the index is full and complete, the book is in itself a glossary.

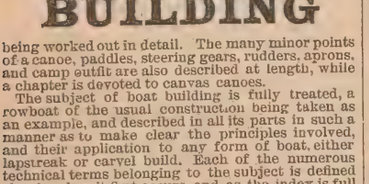
In addition to the numerous diagrams in the body of the work, twenty-four large plates are printed on bond paper, containing the working drawings of canoes for paddling, sailing, cruising

FOR

and racing, with their sail plans, rowing sailing boats, large canoe yawls, and various boats for special purposes, such as gunning boats, yacht boats, and the widely known sneakbox.

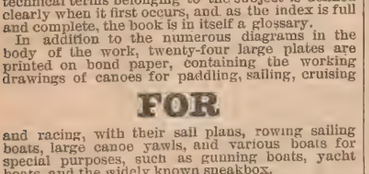
The canoe yawl, a boat between a canoe and a yacht, is illustrated by examples of various craft from 17 to 20ft. long, and suitable for a crew of two or three on a cruise. This class of boat, while little known among us as yet, is admirably fitted for cruising, and will meet the wants of many who object to a canoe as being too small, and yet desire a boat with the same excellent qualities. The boats and canoes illustrated are in all cases among the best of their class, the list of canoes including English, Scotch and American craft, and are all drawn

AMATEURS.



to scale, so as to be available as working drawings. The plates, for convenience in using, are placed loose in a tough manilla envelope and accompany the book.

Pp. 168, with 24 plates of working drawings. Price $1.50. Address,



Forest and Stream Publishing Co.,

ANSWERS TO CORRESPONDENTS.

THE FOREST AND STREAM TRAJECTORY TESTS.

AS weather and circumstances permitted, the trajectory tests undertaken by the FOREST AND STREAM have been pushed forward at Creedmoor. To make careful tests, satisfactory enough in the matter of accuracy to go into our columns with our full sanction, is no light matter, and though all haste has been made, in accordance with this provision, there is still much to be done in the way of calculation and otherwise reducing the results of the tests to a form for publication. Among the rifles in the trial and already put through a portion of it may be named the Winchester .50-95, both express and solid bullet; Bullard .45, Bullard .40, Winchester .45, Remington-Hepburn .40, Colt .32, Bland English double-barreled, Bullard .38, a 15-pound muzzleloader from Major Merrill's Peekskill testing range, Marlin .40-60, Ballard .40 85, Remington .32, Bullard .50, express and solid balls; Wesson .44, Remington .38, Bullard .32, Maynard .44, Winchester .40-60, Marlin .38-55, Marlin .32, Steven .32, Whitney .40, Marlin Government .45, Winchester .22, Remington .22, etc.

The arms were first put through the 200 yards distances firing from a fixed rest, and each shot on its way through the screens accurately plotted, so that when completed the trials will give each rifle an average founded upon the separate calculation of five different trajectory curves. Of course there has been the usual chapter of mishaps, for everybody at all posted knows that rifles are very much after the manner of family baby pets; just when they are expected to look their prettiest they take on a contrary turn and kick up all manner of didoes. Carrier blocks would refuse to move and striking pins became unaccountably jammed; yet on the whole the rifles have behaved very well and put asterisks in the tissue paper screens with great accuracy. Full notes have been taken, and as soon as possible after Mr. Sinclair has made the necessary measurements of the screens and targets all the facts brought out by the trial will be placed before our readers.

A GREAT MISTAKE.

IN his address before the St. Louis convention last week, Gen. Jackson L. Smith expressed his strong disapproval of the laws adopted by some States forbidding the exportation of game. This, he said, was unsportmanlike and a reproach to the State. The meeting by its applause showed its indorsement of this characterization of such legislation. It is a great mistake to condemn non-export laws. They are perfectly proper and just. They are the very best laws to save the game of the West from being shipped to market. Rigid non-export game laws, if stringently enforced, mean that the occupation of the snarer and the deer butcher will be gone, and until that occupation is done away with, no one national association nor ten national associations can stay the gigantic slaughter of game for market.

If any demonstration of the capital working of a non-export law be needed, it may be found in Maine. By no other means was it possible to cut off the butchery of game in Maine woods for the Boston market. The non-export law stopped it. The citizens of Maine recognize the value and utility of the law. Michigan has a similar statute. It is systematically evaded. When the Michigan Legislature possesses sense enough to provide for the law's enforcement, its value will at once be made apparent.

To secure the enactment of such a regulation in every State in the Union would be the very best possible achievement of the new national association.

A GOOD STAND.

FOR many years we have urged the total abolition of spring shooting, and it is encouraging to see that at last there are indications that the seed which we have sown has taken root. The sentiment of the St. Louis convention appears to be in favor of such abolition, and we are sure that all thoughtful men will concur in this. It is unnecessary to repeat the reasons already so many times given, why the birds should not be killed on the way to their breeding grounds. We may, however, present a few extracts from editorials which have appeared during the last few years in FOREST AND STREAM, showing clearly what our position has been on this important question, both as to snipe and wildfowl.

In April, 1881, we said:

The practice of shooting the snipe in spring is one which, in our opinion, is unhesitatingly to be condemned. * * * * the birds are killed while on their way to the breeding grounds—nay in some instances on their very breeding grounds, and often with eggs almost ready for deposition.

Again, in May, 1882, we said:

The shooting of English snipe containing eggs in an advanced state of development and of ducks already paired and on their way to the breeding grounds is over for this season. The slaughter of beach birds will go on, however, for a week or two longer. For every female shot this spring, the stock of birds to return to us in the autumn is reduced by half a dozen. The short-sighted policy of keeping up the killing as long as the birds remain with us is bringing about the result which was to be expected, and the day is not very distant when the shooting for fowl and Wilson's snipe will be practically confined to preserved land. The selfish practices of the sportsman of to-day will meet with legitimate punishment, and those not interested in shooting clubs will put away their guns for a long rest. In the mean time the best shooting grounds are being taken up and the value of membership in regular clubs is increasing. Hotel keepers advocate the continuance of spring shooting as they do the killing of ruffed grouse in August, and sportsmen's conventions and legislatures meekly accept the dictum of the Bonifaces without a word of demur. And so it will go on until our people take hold of the matter in earnest and show by their votes how they feel on this subject.

And again:

The wildfowl should be protected just as other birds are; the same common sense principles applying to other game apply with equal force to ducks and geese. No game should be killed in its breeding season, nor just as it is repairing to its nesting grounds. To shoot ducks which have mated is simple folly, pure and unmitigated. Spring shooting is inconsiderate and improvident. It is gratifying to know that there has been a great change of sentiment on this subject, that men are coming to see the unwisdom of spring shooting, and that the change in public sentiment is likely to be followed by a change in practice also. The good results which would be sure to follow a general cessation of spring wildfowl shooting are admitted by almost all men who are familiar with the habits of the birds, and who have had any extended experience on the various shooting grounds of the country. Nine of every ten of the older sportsmen are agreed that spring shooting is wrong; indeed, we have yet to find one who will contend to the contrary. Nevertheless the same men, or a majority of them at least, go out every spring and kill all the birds they can. Their practice belies their principles; but this is only another of the multitudinous exhibitions of that trait of human nature which prompts a man to "go in" for what he can get now, regardless of the rights of others who are to come after him, and indeed of his own future advantage. This question of spring shooting or no spring shooting is one which should receive careful and honest consideration by individuals, game clubs and State associations.

On June 11, 1885, we wrote as follows:

There is no good reason why any birds, except the few that are considered really injurious, should be killed after the first of February. There should be in the mind of every one who uses the gun a dozen good reasons why they should be jealously preserved. We have not been weary in urging upon the public the necessity of the absolute prohibition of spring shooting. The subject is one which becomes annually more and more important in view of the rapid diminution of all our birds. To continue our present reckless course of slaying many species of birds whenever and wherever they can be found, can have but one result—that of practically exterminating them. It should be the effort of each one who shoots to do what he can to preserve the supply of breeding birds. They may be called the capital on which the sportsman must depend. The increase is the income of this capital, and we ought to limit ourselves to this, and not by short-sighted greediness make away with principal and interest.

It is pleasant to see that the members of the committee took the date which we named, and wisely determined that the close season should begin Feb. 1. This for most of the territory in question is practically Dec. 15, or earlier.

THE LIMIT OF KEEL FOR CANOES.

EVER since the Association rules were adopted in 1882 a limit has been, for obvious reasons, imposed on the depth of the keel outside of garboards, the width allowed now being three inches. This width, it is found, is not enough to allow a keel canoe to compete with a centerboard boat, and the suggestion has been made that the rule be changed, so as to allow more keel. In 1880 there were, we believe, but three centerboard canoes in America, the Wraith, the Queen Mab and the Whimbrel, and in 1881 this number was increased by a few canoes with iron "dagger boards." It had then been decided that a canoe could not work to windward with only one or two inches of keel, and as sailing became more popular many attempts were made to increase the weatherly powers of canoes, all in the direction of big keels. Two of the many keel canoes in the New York Canoe Club had keels 7 inches deep, one with a heavy lead shoe underneath, and a number of the canoes at Lake George in 1880 and '81 had great slabs of rough plate iron some 2 feet long and over 8 inches deep, bolted on to the wooden keel. All the efforts to improve the sailing powers were in the direction of a large keel, and all of them practically made the canoe worthless for sleeping asbore or for transport. One ardent sailor went so far as to propose and start to make a metal casting of great weight in the shape of a half circle 18 inches deep, to be permanently fixed to the bottom of his canoe. The centerboard was hardly known and in little favor, and no attention was paid to its improvement.

Under these circumstances the rule limiting keels was passed, and with good results. The plates of iron and the 7-inch keels at once disappeared, and the capabilities of the centerboard were soon fully developed. One canoe, the Dot, continued to be victorious, though with but 3 inches of keel, but most of the boats were fitted with centerboards. The small limit of 3 inches was decided on because any more is a positive disadvantage in an all-around canoe, adding to the difficulty of paddling, increasing the draft to a greater extent and making it difficult either to land, to transport the canoe, or to keep it upright for sleeping and packing on shore. It was considered that if more were allowed the cruisers would be compelled to use all, to their detriment for all purposes but racing, or they would be beaten in the races by the few who cared nothing for all-around work, or who were so situated that the keel was less objectionable. For the cruiser on salt water with sandy beaches the keel answers very well, as he can beach his craft and always make a good berth for her in the sand, while the keel aids his boat greatly in rough water, but for those differently situated the deep keel will not answer for general work. Thus far the rule has worked well and given general satisfaction, while it has created a fine fleet of centerboard canoes, fast as racers and yet all good cruisers, and there seems little cause to change it. There are few, if any, racing men who would prefer keel to board, and the cruisers are independent of the rule in any case. If the advocates of the keel care to present their case to the Regatta Committee in November they will be accorded a fair hearing, or in the meantime, if either side has anything to say, our columns are open to them for a discussion.

POISON IVY.—It is curious that church festival committees often do not possess enough information about the common vines and plants of the fields to save themselves from wholesale poisoning by the poison ivy. Every autumn the newspapers report a new case of the stupid work. The latest instance occurred at Roselle, N. J., last week.

MORNING.

THE morning wakes on the woods and lakes,
And the mavis a matin sings,
The camp-fire wanes, and the tent is struck,
And the boat by the landing swings.

A thought I give to the friends who live,
Another to those who've gone,
Whose oars now wimple the stream of Life,
That flows by the Father's throne.

There's a sword and wreath, with a grave beneath,
By Nashua's placid flow;
And the legend graved on the marble tells
That the soldier lies below.

And one sleeps well, 'neath the ocean swell,
On the stormy coast of Maine,
His requiem tuned by the sounding surge,
And the roar of the hurricane.

They 'camped far back, on the misty track
Of the Horse, and the Rider pale;
While I, for a century's half, and more,
Have traveled the weary trail.

Ah, well! On the lake may the wavelets break,
But nigher the stream runs fast;
And I poise my paddle, and head the prow
For the foam-wreaths whirling past.

And away we glide on the swirling tide,
Sun-flecked with its silver gleam.
The thrush still sings, but his voice is lost
In the sound of the rushing stream.

The scarlet tints of the tanagers glint,
Where the cardinal's spikelets grow;
And mock the hues of their glowing plumes,
In the limpid stream below.

And the wood duck springs on his shining wings,
From his perch o'er the rushes brown,
By a pool thick-strewn with the bright-hued leaves,
That the ash trees flutter down.

To the left—or right of each foam-flash white,
No rock may our progress stay;
For eye and keel, and the nerves of steel
Shall win in the race this day.

And swift as the glance of the Tartar's lance,
Through the flash of the flying spray,
With never a shock from shoal or rock,
The good boat speeds her way.

There's a short, sharp bend, where the cliffs ascend,
And hang with a beetling frown
O'er the bounding rush of the churning foam,
Where the strong stream plunges down.

And the graybeard sire hath a glance of fire,
As he bends to the swing and sway,
With a cheer for his old foam-riders bold,
Who would fain be here this day. K.

Sept. 14, 1885.

EN KLAPJAGT OVER DANSKE FJELDE.*

THE gray haze of a November morning made a monochrome with the gray walls and paved streets of Denmark's capital, as Dr. Warming and I with our guns and canvas suits and big boots, stepped into our carriage in Vesterbrogade and rattled off past the early milkman with his bumping, thumping cans, and past the homeward bound sporting man, who was damp and limp from long exposure to night air.

Uncas, the setter, we had left whining and barking and pawing at the door, and my heart went out in pity for the poor fellow as my mind reverted to earlier days and a little red school house beneath the butternut trees in a small Connecticut village. A loose clap-boarded, lichen-blotched school house in which I myself could have whined and barked and pawed at the door when the gentians by the brookside were nodding toward the muskrat tracks in the sand, and when the ruffed grouse in freedom walked and flew whither they would in the gay-colored breezy autumn forest. Yes! I could sympathize with Uncas now. We were going on a drive hunt, and knew that the ambitious setter could not resist the temptation to follow if a slick-limbed hare should shake its tail in his face and challenge him for a run. I had hunted deer in the Royal Forest, had shot partridges on the private estates of wealthy landowners, and in fact had enjoyed every luxury in the way of shooting which my Danish friends could furnish, with the exception of the drive hunt which had been arranged for the day of which I write.

We reached the suburbs of Copenhagen and smelled the rich salt air from the reedy marshes just as the haze in the east began to grow coppery, and the peeps of the small birds fluttering from the hedges by the wayside told of the beginning of their day. Flocks of sparrows were already feeding in the stubble, and their chirrups sounded clear and loud through the crisp morning air. The white frost on the fences sparkled on the eastern side of the way, and the heavy-framed laborers with wooden shoes, carrying agricultural implements on their shoulders, bowed to us as they passed on their way to work. Broad meadows stretched out to the right and to the left. Fields of wheat stubble, of green and gray turnips and of black cabbage dotted the hillsides. Here and there stood a dark Norway spruce tree or a clump of beech trees. The air felt just as Pennsylvania air feels, and the groups of apple and pear and cherry trees might just as well have been standing in somebody's back yard in Massachusetts; but nevertheless there was a something different, an indescribable foreignness about the scenery which impressed me constantly and pleasantly.

My enthusiastic companion, who spoke no English and whom I constantly admonished to speak slowly, would start off on an enraptured strain about prospects every few minutes, in the same way as Sam and I encourage each other when the ruffed grouse at home are ripe and the chestnuts shine in plump brownness through the yellow and crumply leaves under foot. Thistles and plantain and clover grew with familiar grasses along the road, and shocks of corn were waiting to be husked. A little way ahead a high thatched windmill swung its long arms slowly around in the light breeze, and over the top of a hill to the right the ends of another windmill's arms appeared and disappeared at regular intervals. Every now and then a big white and black magpie slid from a tree overhead as we jogged along, or a flock of lead-colored crows (*Corvus cornix*) changed fence posts and cawed a salute. Over the bay long lines of geese were cleaving the air with measured wing strokes, and an occasional mallard or snipe settled in among the feathery-topped rushes near us.

The sun was beginning to soften the air of the perfect autumn morning when we espied the group of jolly Danes who were waiting at the place of rendezvous. There were Ole Larsen and Lars Olesen, and Neils Holmsen and Holm Nielsen, and Asmus Rasmussen and Rasmus Asmussen, and Ask Bjoerken, and Axel Hagerup and Olof Qvist, Hjelt Raavad, and Sell Maag and Hjalmer Bjoernsen, and a lot of others whose names have in some unaccountable way slipped my mind. They say that when two Danes go off for a walk they sometimes get so mixed up that it takes weeks to find out which one is the other.

Twenty or thirty flaxen-haired, strong-limbed boys wearing home-made clothes and heavy wooden shoes, carried wooden clappers and old tin pails and other racket-producing implements. The noise part of the hunt was to be left to the responsibility of the boys, and never was responsibility carried more lightly. There were hunting suits of corduroy, and hunting suits of canvas, and hunting suits of business suits there. There were English guns with shoulder straps, and Belgian guns with shoulder straps, and American guns with shoulder straps; and all these straps wrinkled the coats of their respective owners as the hunters stood about chatting in Danish and preparing for the start. Many of the men spoke German and French, and it was surprising to find that many who had had little opportunity to speak English were able to carry on conversation in that tongue.

A few minutes were spent in making arrangements, and then we formed in a line out across the fields, the hunters about two gunshots apart and the boys sandwiched in between. There we stood in picturesque style, the fox-tail grass and the red-flowered wild poppies and the seedy pig weeds glistening about our feet with melting frost, while every one impatiently awaited the signal to start. Suddenly a bugle blast rang out along the line, and at the same instant the boys began a lively clapping and clattering, and the shooters shouted in glee to each other, as with cocked guns and accelerated heart beats we began a military march toward the horizon.

From under the very feet of Stjerne on my left an enormous hare bounds out like a jackass struck by a locomotive, and with ears laid back and short tail bobbing begins to measure off the ground in rods. A No. 10 roar calls out for him to halt, and through the smoke we see the hare tumbling and rolling and kicking sand and grass into the air. A boy runs forward, and grabbing the heavy animal by its hind legs throws it over his shoulder and hurries back to the line. A hare weighs as much as a shotgun, but no boy ever felt too tired to carry one of them. Another flash further down the line, and another an instant later, excite the boys to the developing of an unbelievable degree of noisiness.

There goes a hare which was not hit and three dogs start for him at once. Over the meadow they go at a tremendous pace, the hare apparently hardly touching the ground with his feet, but in a brown and white line of waving motion leading the canines easily. Were he to keep straight on at this rate he would be in Chicago in time for lunch, but playful Hvide, who strikes him in the forequarter with a stray shot. Off he scurries, handicapped, with one of the dogs close at his heels; but it seems as though a bar of steel prevented the dog from gaining the last necessary foot of distance, while the hare bounds up and down so fast that I wonder why he don't shake his head off or fray the end of his tail. Hares are put together with flail strings, and this one does not even shake an ear loose. The shooters hold their breaths in interested expectancy. Suddenly the hare doubles, and the dog in the funniest kind of a way runs sprawling several yards past before he can acquire the saw-horse stiff-leggedness which he requires for stopping. Another dog springs open-mouthed on the hare, but he opens his mouth too widely or something of the sort, because the hare seemed to pop right through him and come out smiling. The third dog joins the first one, and together they dash furiously through the grass and out across the ploughed field. The hare misses his footing and a gleam of white belly fur appears for an instant as he rolls on a furrow. The dogs make a dive for him, but they are too simultaneous and stand themselves up like three muskets on an armory floor. The hare has all of the room and time that he wants, and leaves the dogs standing as pigeon-toed and discouraged as a man with a "busted" collar-button on a hot evening at the theater. A puff of smoke and a loud bang are followed by a reaping of grass leaves about the hare, and the dogs have an opportunity to "quit their fooling." It seems as much a pity to let off that hare's stored-up energy as it does to let off the steam from an engine at the end of a day's work, but the thing is done, and the hare ought to be glad of it, because he must have been getting pretty tired.

As we start on again Bjoernstjerne quickly jumps around and fires into the turnip leaves through which we have just passed, bagging a hare and half a dozen turnips, but letting a boy get off as a fast driver to the right without firing at him. Notwithstanding the noise and disturbance the hare had lain so close that he was passed unobserved and might have escaped if he had allowed us to do the departing instead of trying to do it all himself. Ploughed land seems to pan out the best for hares, and every few minutes one goes bounding out from a furrow and vaulting from one hummock to another. Occasionally one will jump wild but the dogs usually manage to get him back to one of the hare receivers and he is relieved of future care. All at once the clappers stop their racket and every one looks to see what game is coming. A couple of big wood pigeons are bearing for us bow on. Nearer they come and larger they grow, until it is too late for them to pass—put their tails as hard to port as they may. Their white-lined wings go with misty fastness and they spring away from each other overhead. Three or four guns belch forth rolling volumes of smoke, and the hurtling storm of lead perforates atmosphere and pigeons alike. Down come both birds together, twisting and whirling and losing downy feathers as they fall. Little straw-colored Harald runs out and brings in the biggest bird, wiping the blood from its bill with his finger and then wiping his finger on his pantaloons—just as he does with his own chubby nose. He is anxious to carry the bird and I tell him that he must be very careful with it. Such tender carefulness as he displays one seldom sees in a boy, and when he is trudging through a wet spot he holds the bird over his head where the saw grass won't muss it, until tripping up on a willow root the poor little fellow snaps shut like a jackknife and pokes the pigeon so deep down in the mud with one knee that the saw grass turns green with envy.

Here comes a short-eared owl from the marsh. Swinging along with soft noiseless flip flops he skims the perfumed air from the aster tops, and carelessly wafts himself into our dangerous midst. The opportunity is too good an one for Svensen to resist, and borne down with disappointment and No. 4 shot, the owl bites the dust and the dog's ear.

The clappers are again quiet as a mallard duck flying high passes over the line on his way to some small inland pond which he knows about. Half a pound of shot goes up after him, but he points his bill toward heaven and chews the air up finer than ever with his stout whistling pinions. So far as I know, he is going up there alive. Hardly has the smoke stopped sifting through the poplar sprouts ahead before a pair of pretty little blue doves dart past like arrows. One, two, three shots and one dove is down; four, five, six, seven shots and the second one tumbles into the clover. How smooth their feathers are, and what delicately moulded heads and dainty red feet they have!

"Smukke dove! Saa lille og nydelig,"† says big Waldemar, as he brings one in in his hand.

It doesn't take long for the sun to reach the noon mark in Danish November, and it gets there before one really feels that Phœbus dare stand up straight. A wagon which has been following us slowly through the meadows now drives up and the hunters and boys brush each others' ears with their elbows as they help themselves to the hunks of cheese and bottles of beer and boiled eggs, and other luxuries which the wagon contains.

A small ravine, on whose grassy banks the Vikings probably sat on grasshoppers and sharp stubble just as we do to-day, runs through the fields near our halting place. We pull the crooked, stiff hares out straight, smooth their fur, and lay them in heaps by our sides. We toss lunch tidbits to the dogs, light pipes and cigars, kick our heels into the sod, fire egg-shells at the boys, and joke and laugh until the uneasy members of the party suggest that we be off again. The dogs notice the first movement, and in exuberant spirits leap over their masters and over each other, and bark in good plain English. This time the line of march extends down toward the sea. More hares spring up and die, ephemerally. Another short-eared owl and another pair of doves find that our influence was more reaching than they had thought. We are approaching a series of sand knolls which are covered with tall, dry, sparsely growing grass. The clappers remain quiet. A word of caution is passed along the line.

Hardly have our feet begun to crunch the loose sand when a covey of twenty partridges bursts out of the grass with an explosive rush of wings, and spreading their ruddy tails widely, and crying *quirlp-quirlp*, *quirlp-quirlp*, in shrill, quail-like tones, they lengthen out into a straggling flock and head for the marsh. Poulsen, who is nearest to the birds, coolly winds up one of them with each barrel, but Iversen, who tries to kill the whole bevy at once, fails to get any of it. Two men off on the left pick out four passing birds, and the rest of the partridges, after a rapid flight of a few hundred yards, sail off on curved wings and scatter singly among the tussocks of grass. A bird which stayed behind flies up almost at my feet with a startling whirr, but he joins the minor part of the flock and helps make it the major part. The scattered partridges lie in a territory which belongs to a distant part of our line, but we observe that the care of the birds can be safely left to the men who are burning powder down there.

The sand knolls crossed, we reach the marsh, but on we go through the sloppy reeds and splashy grass holes as though we were on a board floor. In goes little Ivan just ahead of me, splattering the water with heavy shoes, and sprinkling it over his fox skin cap and home-made blue blouse. In go Bjoerken and Jansen and Raavad. Out go a snipe and a fox and a duck. Snipe jump up on all sides and zig-zag off "skniching" huskily, just as they do when Culver and I flush them from the soft ground of a New Jersey swamp lot.

The marshes here look very much like our own marshes at home, and any one not a botanist would have difficulty in determining from the surroundings whether he were in New Jersey or in this far north Sjaelland. The ducks are rather wild and they usually manage to get out of the way of our noisy party before we get within range of them. Now and then a single mallard will lie concealed under the fallen sedge until we are close upon him, and then with loud quacks and swishing wings he tries to escape. He is a doomed and boomed bird, every time.

The daylight is fading rapidly, and by 4 o'clock it will be too dark to shoot. Working back toward the hills in broken line we pass the house of a peasant family and my friend Dr. Warming and I stop for a moment to see the place. The one-story house with whitewashed stone and mortar walls is built to surround a square court yard. A single large gateway leads through the south wall of the building into this court, in the middle of which latter a high wooden pump is surrounded by ducks and geese and chickens. The court is cobblestoned, and pretty green algæ run off along the damp crevices between the stones. Several doors open into this central yard. The few small windows are set deeply in the walls of the house. The high-peaked roof of two-foot thick straw thatching is covered with broad patches of rich green moss. Part of the house is the barn, as Mike would say, and the horses, cows, wagons, poultry and family all go and come through the opening in the south wall of the building. Two or three dark Norway spruce trees spread their bottle-green branches over the house, and the contrast with the whitewashed walls is a striking one. Several lead-colored crows flew up on the thirty-foot-high straw stack by the barn as we approached and they now sat cawing at us within easy stone shot.

We are greeted by the children, who pull off their caps politely and then rattle their wood shoes on the cobbles as they run off to their mammas in the doorways. Strong, handsome, yellow-haired children, with bright faces and clear gray eyes. I looked in at a school window one day and the whole room seemed to be lighted up with a mellow glow of yellow hair. All Danish children have to be strong. The weak ones die off when they begin to learn the language, and, like Connecticut River shad, only the most robust are able to surmount the difficulties which beset their way.

Doctor and I, on invitation, step into a simply-furnished

*A clapping hunt over Danish fields.

†Pretty dove! So little and cunning.

room, with white-sanded floor, and sit down by the square table in straight-backed chairs. Our host is delighted when he hears that I am a Yankee, and he wishes to bring out the household penates in bottles, but we thank him and beg him to be quiet. Turning to little Maren, who stands bashfully covering up two-thirds of her grin (smile) with a fold of her mother's dress, I say in my most enticing Danish, "Kom hin lille pige, og sit paa mit knee. Jeg skal ikke gjoere dig ondt."‡ But my pronunciation gives her a terrible fright, and, disappearing from sight in the dress like a young kangaroo in its mamma's waist basket, she begins to sob. A looking glass hangs on the wall, together with two or three highly-colored lithographs representing "The Girl of the Period," "The Old Oaken Bucket" and "The Pleasures of the Country," etc. Several mottoes worked on perforated paper with bright-colored worsted are stuck up here and there, but one can't read the words any better than he can read the same in worsted English. I guess likely they say "God bless our home" and "Blessed are the pure in heart," and things like that. A large Jerome clock stands on top of the unpainted cupboard in one corner of the room, and from poles overhead are hung dried herbs. A wooden bracket by the looking glass holds the usual comb, which needs false teeth, and the loose-backed hair brush, which reposes on all such brackets.

It is time to go. As I step to the stone threshold the lord of the manor extends a hand like the hand of Providence, and engulfing my own in a maelstrom of fingers he works my arm up and down in the same manner as he does an eight-foot pump-handle out in the court. I escape in fairly good condition, however, and amid profuse good-byes we go out through the big gate and into the field of tall, curly-leaved green cabbage to join the straggling hunters who are preparing a line for one more trip across the fields.

All is ready, and together we advance in imposing array, each man anxious to add just a little more game to his list. Every few minutes a big hare makes a sudden spurt and tries to kick the world around faster on its axis, but he is stopped in time to save the time of day. A flock of partridges make the trembling dry grass wave in little swirls, as the birds, with a mighty spring, launch out into the air right near us. Glass-ball shooters would have instinctively yelled out "broke" if they had seen the feathers start when four or five of the birds suddenly became limp and noiseless in midair.

It is almost dark when we reach the road and take a short cut for the old inn of Valdby Kro. A fox runs out into the field in the distance, and I make the whole crowd laugh by my pronunciation of his Danish name "raev." They say that the word which I use sounds like the Danish name for a boot target. Two or three of us try to scramble over the rickety fence at the back of the inn, but a sample dog—a Great Dane—is waiting for us on the other side, and as my friend says that it hurts to have a leg pulled off by a dog of this size we decide to disappoint the dog and let him wait for somebody else. I don't care how prosperous a hotel may be, it is bad policy for the landlord to keep a dog which destroys customers before they have paid any bills. Inside the hotel guns are stacked and hung up in the reception room, and hats and heavy coats follow suit. Over in one corner is a great heap of hares, boys, birds and dogs. Everyone is happy, and securely seated with is glass of lager—of cool, cream-foamed lager which trickles over the edge of the mug and mingles with the misty condensed moisture on the outside—is telling his neighbor confidentially just how it was that he had the good luck to kill one-fifth of all of the game bagged during the day.

A smile born of light hearts and lighter stomachs seems to flash across the room when the dining-room bell gives the signal for the shuffling of heavy boots to commence. The tables are groaning with solid sections of brown, juicy, steaming roasts, and piles of mealy potatoes enveloped in hot fog, and long white platters of whole salmon through whose tender torn skin the pink flakes and streaks of white fat look all ready for the limpid golden butter sauce which stands in the brimming full dishes near by. Dark bottles with white labels, and red bottles with dark labels are stuck in between the dishes for the purpose of keeping the edges of the crockery from chipping. Tall, handsome Danish girls are running hither and thither with chicken soup for this man and hare soup for that man, and extricating order from the chaos on the table with a marvelous degree of skill. Good nature is rampant, and the fast delivered hearty speeches are followed by rousing echoing cheers. Cries of "skol! skol!" follow every toast in which the Yankee is mentioned, with a vigor which shows how deep and real their feelings of hospitality are, and men come from the distant tables to express friendly sentiments toward America and Americans in general.

An hour passes by, and the tide of speech gradually subsides. The stage of quiet enjoyment is ushered in with the blue-flaming plum pudding; and coffee with cream melts all dispositions into one easy flowing current of serene contentment. Snatches of Danish song which have been idly traveling about the table for several minutes begin to join forces as we light fragrant cigars and pipes, and lean back lazily and stretchful in our chairs.

While others sing I pull from my hunting coat pocket the old battered meerschaum, and fill it with yellow, fragile grained "Loue Jack." That dear old meerschaum that I have smoked by my camp-fire in the Adirondack forest, while the birch log sizzled and snapped and fitful gleams of red flame lighted up the form of the strong antlered buck which lay dead on the moss by my side.

The same fond pipe that I have smoked in the evening light while I sat with Sam on the threshold of a Pennsylvania farmhouse, and the October breeze whirled the rustling leaves about our day's load of ruffed grouse, woodcock and quail, and toyed with the wavy locks of our tired and sleepy setters.

The same beloved meerschaum that I have smoked on a Connecticut June noontime in a sunny, ferny corner of the rail fence among the white birches, where the fresh sprouting grass on the bank stirred sunshine and shadow into the clear waters of Poohtatook Brook with every zephyr, and the dashing half-pound trout waited in the foam-flecked roaring torrent among the mossy boulders until I was through with my smoke, and the brown thrush in the willow-top asked the buttercup-dancing, air-prancing, soul-entrancing bobolink to call me away from my reverie.

The same quieting pipe that I have smoked in the mid-winter icy blast in Great South Bay, while the staunch sloop plunged and strained at her anchor among the rushing, voice-smothering, white-capped waves, while the wind whistled and hissed through the rigging, the boom creaked and swung with every lurch, and the heap of ducks exchanged places with the bushel of oysters on the cabin floor; while the thundering breakers on the outer beach, furious in the casterly gale, bellowed and groaned in hoarse monotone between the reverberations from the thousands of tons of black and whitening billows rolling in mighty front high upon the sand bulwarks, and dark night clouds all ragged and torn drifted low and swiftly overhead.

Every whiff of smoke from the pipe is richly flavored with the essence of old associations, but I am precipitated back into Denmark as one of the party, a gigantic sturdy, good-natured hunter, mounts a platform at one end of the dining-room and prepares to auction off our game for the benefit of the poor people of the village. This is a customary proceeding after such a hunt as we have had and the bidding is spirited, some of the hares bringing four or five times their market price.

The auctioneer gets one krone (twenty-seven cents) for one of his assistants whom he holds up before the audience, and a smaller man who is held out at half arm's length by the big one is knocked down to a bidder at ti oere (two and a half cents).

Our day is finished. MARK WEST.

‡Come here little girl and sit on my knee. I shall not hurt you.

HUNTING IN THE HIMALAYAS.

Lights and Shadows of an Indian Forester's Life.

VII.

RAM BUKSH is a hero! By the time he had been a fortnight in camp, he had heard probably all the thrilling tiger stories known to every native in camp, and as some of my chuprassees had been for years past in the service of forest officers in the Sewaliks, these stories were not a few; but Ram Buksh never heard one without being able to cap it with something more thrilling still, from his own personal experience, until at length he created so decided an impression as to his skill on the long bow, that there was considerable doubt as to the authenticity of any of his stories. In his presence the public voice was loud in its condemnation of my importation of the Ghoorka party as a quite unnecessary measure, while Ram Buksh was in camp, a view in which Ram Buksh entirely coincided, declaring that if he did not feel tied to the Chota Sahib by a sense of duty and honor, he would certainly throw up his service and devote himself entirely to the man-eater until he should be able to claim the reward. As to the Ghoorkas they were all very well, he said, in their way, nobody disputed their bravery, the cunning and stealth of the tiger had to be overmatched with superior stealth and cunning, and this was to be looked for only in a shikaree and not in a soldier.

Well, a party of eight Ghoorkas had been granted a month's special leave of absence from their regiment, and had reported themselves for duty more than a week before. I had stationed them in two parties at twenty miles apart, and they had not been twenty-four hours at their post before the man-eater carried off a bamboo cutter almost under the nose of one party—about two miles from their camp. It was evening when the news of the kill reached them, and of course nothing could be done that night, but they were off at daylight, got on the trail, and followed it up until they came on what remained of the body; they then mounted trees and held watch all day and the following night. Between dark and moonrise there was an interval of four or five hours of darkness, during which a distinct grunting or growling was heard close to the corpse, and first one and then the others fired into the darkness, scaring the beast, whose tracks, examined by the morning light, proved that the visitor had been an astonished boar. A few days later there was a tiger skin stretched out in camp, and no one chaffed Ram Buksh any more, for he slew the beast on foot and single-handed, and the slaying thereof was in this wise:

After a cursory inspection of the block of sal forest on the left bank of the river from Bocksar to fifteen miles up stream, I took my map, divided the forest into strips as nearly a mile wide as local conditions rendered convenient, and placed Charley C. with a party of two hundred coolies to clear an eighty-feet roadway through, due south from the first designated point. Fronting the forest is a terrace of about three hundreds yards wide, covered with grass about three feet high, then a fall of about one hundred and fifty feet to a second terrace or valley which slopes gently down to the river; this lower terrace carries great clumps of grasses from twelve to sixteen feet high on the wet spots, while the general surface is covered with short grass not more than eighteen inches to two feet high, and a man standing on the high bank has a capital view of the hog deer and other game passing from clump to clump. One morning Ram Buksh, tired of sitting still and watching the wood cutters, and having received positive instructions from me not to wander far from the party, but to be on the watch in case the man-eater should turn up unexpectedly, asked permission from Charley C. to go down and see if there was anything moving about below. Arrived at the edge of the upper terrace he saw a herd of spotted deer right abreast of him, but about a hundred and fifty yards from where he stood. There was a fine old stag among them, and not caring to risk so long a shot, he determined to steal down the slope, which is covered with a low, dense jungle. Scarcely had he taken a step downward before an angry growl directed him to a tiger, barely ten feet from him, crouched and apparently ready for a charge. To raise his Enfield, fire and spring back and crouch in the grass above was the work of an instant. Charley heard the shot, and looking around saw the shikaree sink down in the grass, and after watching a few minutes for his reappearance in vain, took his rifle and went down to investigate. Reaching the spot and glancing over and seeing nothing below, he turned and raw Ram Buksh peering cautiously up and beckoning to him. "Tiger, Sahib, tiger," said he, excitedly, and then gathering confidence from the reinforcement, stood up and reloaded. Charley knew but little Hindoostani, and Ram Buksh as little English, but that Ram Buksh had fired at a tiger close at hand was as clear as words could make it. Advancing cautiously, Ram Buksh again sighted stripes in his old position, and as he raised his rifle Charley, too, got a sight of him, and both fired. Ram Buksh sprang back as before; Charley, having a second barrel, stood his ground for a shot on the wing, but the beast made no sign, and Charley, satisfied that he was dead, shouted to Ram Buksh, who reloaded and joined him. Going close, Charley, keeping his finger on the trigger, touched the beast on the face and then saw the blood oozing from the center of the forehead. Ram Buksh's first shot had entered the brain; of the second volley, one shot had struck the fore paw, the second had entered the flank. And now Ram Buksh is a hero and his tall figure has really a very commanding air as he struts about the camp. Of course it was claimed that this was, or at least might be, the man-eater; and being prepared for this, I sent up my elephant and had the carcass brought into camp and the inside opened up for inspection. This afforded very decided evidence; there was a good supply of deer's hair in the undigested refuse, but no trace of human hair. None the less Ram Buksh talks hopefully of bagging the man-eater, while he admits that superior skill may of course be baffled by better luck.

Meanwhile every day brought for us its regular round of duties. Mounting my elephant shortly after daylight I dropped Charley at his fireline and then passed on to the inspection of a block of four or five square miles of forest, noting down soil, aspect, age of timber, proportion of stock to full crop, condition of the forest floor, natural features, water courses, etc., and on my return to camp, I traced out my day's inspection on the map, numbered the block and then filled in a detailed description of it in a book kept for the purpose. In these morning rambles I put up lots of spotted deer, sometimes roaming in herds through the forest, sometimes crouched in the "fairy rings" (spots of a quarter to a half acre in area, in which coarse grass had got the upper hand, and prevented seedling trees from springing); I had no difficulty in keeping the camp supplied with venison. Ram Buksh, too, had many opportunities of stalking a deer and brought one in occasionally. I generally got home to breakfast about noon, opened office at 2 o'clock, wrote rough drafts of my English correspondence and sent them to my English office, received timber merchants and heard their personal applications for sal beams and other building timber, and then summoned the sheristidar, had the vernacular reports and correspondence read to me, the sheristidar or his scribe jotting down the substance of my replies, which he drafted fully in time to read to me the next day for my signature.

My morning inspections were always spoken of as "Sahib shikar kogya" (the Sahib is gone hunting), and I knew very well that the superintendent received a daily account of my doings from the sheristidar, and of my demeanor during office hours, and that these accounts all tended to inspire perfect confidence that I never troubled my head about their doings. Every day brought an application from some merchant for permission to remove a windfall sal tree or a dry standing tree from some designated locality, and my uniform order "subject to the superintendent's inspection and approval" was soon considered a matter of course. I jotted down the names of all the applicants and localities, and only bided my time for a wholesale seizure. It was not of much moment if a score of timber trees should slip through before I was ready. I wanted to create confidence, make a wholesale seizure, and inspire terror. One afternoon I heard altercation and scuffling outside, and asked the sheristidar what it meant. He went to the door and began to abuse some would-be intruder, and ordered the chuprassees to drive him away, and then came back and reported that it was a bad character, who had been caught stealing timber and been ordered out of the Division. I made him point out the fellow, and after office I took my rod and went down to the river alone, where, as I anticipated, I was in time joined by the accused. I listened patiently to his petition, and then, without replying directly, I asked him "How much do my people make the merchants pay for green sal timber?" He hesitated, but on my assurance that I would conceal his name and hold him harmless, he gave me the names of half a dozen merchants who were felling and removing green sal trees at prices ranging from eighteen to twenty-four cents a cubic foot. Our rules are that no sal trees shall be felled except by the department, whose operations for the year are confined to a particular block, the timber converted by our own sawyers is principally exported as small scantlings and sells at from eighteen to twenty-four cents, but we take orders from local merchants for beams, for which they pay us from thirty to thirty-six cents and remove them themselves. As it would not pay us to hunt up and convert windfall over so large an area, there is a standing rule that it may be sold where it lies at twelve cents a foot in the rough.

There was now a large trade being done in creating windfalls. The merchants selected first-class trees worth thirty-six cents a foot, for which they paid the superintendent or the local forester eighteen to twenty-four cents, and these credited the department with twelve cents. The difference goes into a common fund, and at the close of the season is is divided among all my official employees, from the highest to the lowest, every one getting a share proportioned to the responsibility of his post. As regards the bamboos, the merchants take about twenty-five per cent. more than they are charged for, and share the price with the department (so says my informant). I found a perfect system of checks in vogue. The forester counts and gives a check for the members; eight miles down the road toward the settled districts is a line of patrols, whose duty it is to count and countersign the checks, and send them certified to my office. Of course the natives smile benignly at the idea of the Sahibs' trusting to so simple a system. Wait a little. I have them all in my net, and await only definite instructions from headquarters before taking action. Peculation is a recognized feature of administration by native agency, and a fellow who forgets old Talleyrand's maxim "*Surtout, pas de zèle,*" is liable to come to grief, as I know from past experience.

After the first week I found the blocks getting too far for my inspection from headquarters, and sent my camp ten miles up stream, and as the river was now getting near its lowest I determined to march up the low bank, estimate the obstacles in the way of rafting, and beat up some of the long grass clumps; flowing through a heavy diluvial drift, I saw that I had only to pick up the boulders from the center of the stream, and arrange them in line on either side, to get a thirty feet wide channel, with from eighteen inches to two feet of water, with a little extra labor for rapids, and an occasional big boulder requiring blasting. I put up several hog deer on the way, and by the time we were seven miles from camp we had got a stag and a hind lashed behind the howdah. At this point we were beating a clump of long grass, and put up something heavier than a hog deer; we could see nothing, the grass was fifteen feet high, but we heard the rush of a heavy body and pushed through. It was a gerao (a large Sewalik stag about thirteen bands high, carrying very large horns), which disappeared behind a clump of grass before I had time to draw on him. Turning the elephant up stream I laid down my rifle and as I did so I saw a tiger looking at us not fifteen yards off. I saw only his head above the grass, and that disappeared the moment our eyes met. Calling a halt and seizing my rifle I watched for a chance, but a light ripple in the grass, which may have been made with his head or his tail, was the only visible sign and did not extend a tiger's length. Whispering to the mahout to beat up the clump, we entered close after the beast, but there was no movement, and although we spent a full hour beating up the grass, we failed to find any trace of him. These beasts dodge a single elephant with perfect ease in long grass.

It was now nearly 1 o'clock and I made for the camp, crossing the Ramgunga and ascending to the upper terrace, which we had no sooner reached than we found ourselves within a hundred yards of a solitary elephant. The beast sighted us immediately, and the mahout suggested flight, but that would have been poor policy, so I told him to move straight for the camp, which was just visible about half a mile off. The elephant also moved off about fifty yards, and then stopped and looked at us, but we made no hostile sign, and he appeared indisposed to provoke a quarrel and made straight away for the forest.

The following week was a repetition of the last as regards my forenoon duties of inspection. I came upon one fresh kill within two miles of my camp, and spent a couple of hours beating up the surrounding grass, but without any result, and as there was no tree near at hand fit to make a perch on, I returned to the kill, and making a long incision in the haunch that had not been touched (it was a gerao hind), I poured in about ten grains of strychnine. I must confess that I did it very regretfully, but the strychnine had been sent me from headquarters with positive instructions to use it whenever there was no reasonable probability of bagging the beast, so I had no alternative.

I came to the kill the next morning, found that it had been dragged about a dozen yards off, and some at least of the medicated haunch eaten; and as the beast had evidently not made a full meal, I thought it probable the poison had taken prompt effect, but I beat the surrounding grass in vain. If dead the vultures will point him out by and by, but too late to secure his skin, which at best would be but a poor trophy for a man whose memory is not good enough for invention. I might have presented it to a man in our department to whom I gave a dozen black buck skins about six years ago. Last year, in company with another of our fellows, I ran across his camp, and the conversation turning on black buck shooting, my friend gave a detailed account of how, when and where he had shot the skins in his camp. I turned over two of them and recognized my own old skins.

I hope in my next to have something satisfactory to report anent the man-eater. My chief writes me that he is coming down with the determination to do his wickedest; so I suppose there will be a few days devoted to tiger hunting, and as we shall muster four if not five elephants, we are likely to make it exciting for any tigers we may come across.

SHIKAREE.

CAMP BOKSAR, Lower Gurhwal, Sewaliks, East India.

FLORIDA CAMP GROUNDS.

JUST now, when in the far North autumn frosts and untimely snows give premonition of what is to be, many longing thoughts turn to the Land of Flowers, and it is likely that more outers and health-seekers will try a winter in Florida the coming season than in any previous twelve months since the days of Ponce de Leon.

And it is possible that eight months spent on the Gulf coast—mostly in open camps—may enable me to give a few hints that will be of use to a new comer. As to location, I do not claim any special superiority for this section, although the fact that I am content to make my headquarters here is proof that there are some good points about it for a hunter, angler and canoeist. In the first place it is healthy, and there is large scope for choice of camp sites on high, dry, oak and pine land. I like the convenient mixture of lake, bayou, river and salt-water boating and fishing. There is good bass fishing in Lake Butler, and also on the Anclote and "Cootie" rivers.

While it is not a country to delight the heart of the skin-hunter or duck butcher, there is a great variety in the game, from shore birds and quail to deer and turkey. This is a novel feature to me, and I rather like it. The canoeing too is the best I have found, and the waters of the Gulf so quiet that I have cruised the little ten-pound Rushton for twenty miles down the coast and back, without shipping a drop of water. Fishing is excellent here, as it is almost everywhere in Florida. A man must be a poor shot and worse angler who cannot keep up a camp supply of fish and game in this section. At present I am camping within a mile of the post office, two hotels, stores, etc., and I shoot all the quail and rabbit I can use without going beyond sight of the camp.

I like the sort of woods life too that has a spice of convenient civilization mixed up with it, where, for instance, I can visit with intelligent men from different sections of the country, and get into the Bucktail and paddle in an hour to a secluded spot where I may camp for a month without seeing a human face. The associations here are good, and the natives are friendly and obliging, with one good trait that, I am sorry to say, does not pertain to the natives along the banks of the Susquehanna, *i.e.*, they never disturb nor meddle with your camp here. Even the colored brother, whom we of the North are disposed to regard as a trifle light-fingered, will not molest nor pilfer from the camp of an outer. For six months I have been in the habit of leaving all sorts of hunting and camping duffle in an open camp while I was off cruising, sometimes for days at a stretch, and I have never had so much as a fish hook taken, nor the camp in any way molested. In Northern Pennsylvania (I hate to say it, but it is true) they would steal me poor and burn my camp.

Luckily it is the policy here, both with the native population and the land companies, to encourage and assist campers and outers as far as possible. As regards mode of life and cost of living, there is a wide range of choice. The Tarpon House charges $2 and $2.50 per day, special rates by the week or month. Capt. S. D. Kendall will take three or four boarders at $5 per week. His house is pleasantly situated on the banks of the Anclote River, one mile from the springs. He has a sloop-rigged sailboat and two canoes, and there are boats kept for hire at the Springs.

The health seeker, however, had best camp out, especially if troubled with difficulty of the respiratory organs. Because hotels and boarding houses do not generally provide for fires in their sleeping rooms and furious "northers" are not uncommon here, at which times the rain pours down in torrents and the mercury sinks nearly or quite to the freezing point. Of course the air of rooms where there is no fire becomes cold and damp, and any man who suffers from catarrh or phthisis knows what that means. Now, in an open camp with a roaring light wood fire in front, an invalid can always keep warm and dry, which is of the utmost importance; let alone the fact that the inhalation of lightwood smoke is pretty nearly a specific for catarrh. The cost of living in camp is less than most people would suppose. Judge A. J. Cornell, of Granby, Conn., who spent last winter here with his family in a tent, gives the cost of living for three persons at $7 per week. But, he says, "if one were successful in hunting and fishing, it could be done for less." My own expenses for four months foot up $25.75. The rod and gun helped out to some extent.

The president of the Lake Butler Villa Co. says in his prospectus, "Every assistance possible will be rendered to those who desire to camp at Tarpon Springs, desirable and sightly locations will be cheerfully given and every possible attention rendered to make their stay among the pines comfortable and enjoyable."

Probably a large majority of the outers who come to Florida the present season will turn their faces to the eastern coast, the banks of Indian River, or the St. John's, as being better known and more easy of access. But many will try the Gulf coast, and a few may like to try camp life near Tarpon Springs. If any such there be, and they would like any information that I can give, I will cheerfully answer letters of inquiry; or if called on at my camp will go with parties to point out eligible sites for camps, etc. Almost every one at the Springs knows the Oak-and-Pine and the path that leads to camp.

NESSMUK.

TARPON SPRINGS, Fla.

POINTS WORTH CONSIDERING.

1. Because of the compact style of its typography the FOREST AND STREAM actually contains, weekly, more reading matter pertaining to its chosen field than is found in any similar publication in the world.

2. In general excellence the reading columns of the FOREST AND STREAM are of a higher grade than those of any similar publication in the world.

3. Taking into account the amount and the character of weekly reading given, the FOREST AND STREAM is away ahead of any similar publication in the world.

4. If a sportsman wishes a sportsman's paper, he will be better suited by the FOREST AND STREAM than by any similar publication in the world.

Natural History.

Address all communications to the Forest and Stream Publishing Co.

NOTES ON THE NIGHTHAWK.

THERE was possibly never more of a misnomer in natural history than the name of this bird. Why the term hawk (a bird of prey) should ever have been applied to a creature with an almost flexible beak and useless feet for clutching purposes, will always be a mystery. There is nothing about it suggestive of hawk and almost everything about it to make it a "swift." The beak is not hooked like the falcon's, while its hairy head, large eyes and rapidity of flight should have prevented its ever being classed with the birds of prey.

The writer while traveling over much of the country, both among the large cities and in the wilds, has had many chances to watch this curious bird under widely varying circumstances. It is strange that this creature should be plenty in such extremes of surroundings, being very thick about our large cities and equally plentiful in the wilderness. Probably none of our centers of population have more nighthawks about them than Chicago. Every night from early spring till late fall, as twilight approaches, the penetrating *peet* of this bird will be heard above the business center. At first it keeps well up in the air, but as the sun sets it flies lower and lower until many of its flights are but little above the warehouses. They are there in great numbers and have been for years. Over most of the cities bordering on the great lakes they are frequent and furnish much entertainment for people by their aerial evolutions. I have never been able to find out where they kept themselves daytimes, although I have read in the columns of FOREST AND STREAM of their breeding on top of the high buildings in Cleveland.

There seems to be a great difference in the times of their appearance on different days. I have seen them over Buffalo, N. Y., as early as 11 o'clock in the morning of a bright day, from whence they were visible until dark, while on other days they kept secluded until nearly twilight. Over some towns I have heard their note resounding until midnight, although this was on moonlight nights, but in most places I have missed them by the time it became pitch dark.

These birds seem to be less numerous over the seacoast cities than those more inland or in the lake region. It is strange that they confine their flights to the business portion of places, and are not, so far as I am posted, ever seen over the residence portion. Here would rise a question as to whether more insects (of their kind) emanated from the great marts of trade than from buildings equally thick but used for different purposes. The writer spent last summer in Maine, about twenty miles south of Lake Umbagog. A small stream originating in the mountains flowed through the town, called the Sunday River. It varied in size at that time from the width of a good-sized brook to fifty feet wide in the shallows.

Every day after the middle of August a great swarm (it could be likened to nothing else) of nighthawks would come down out of the mountains about 4 o'clock in the afternoon and course back and forth over about a mile of this stream for about an hour, when they would move over to a field from which the hay had been cut, and spend the rest of the time until dark over that spot. There were always several hundred in the flock, and they very much resembled a swarm of flies over a dish of sweets. Back and forth they would go, some flying at the rate of an express train, others darting back and forth, up and down, and some going in all of these directions, as only a nighthawk can. It was a fine sight, and one not often to be seen. Such evolutions as we witnessed filled us with admiration. It is very much to be doubted if the same wing-power, skill and aerial agility is to be found in any other bird. To see one of them flying at the rate of thirty miles an hour, stop in his own length and either go straight back or up or down was a pretty sight, and fills the observer with wonder for the wing-power of these birds. The nearest approach to them in its manner of flight is the chimney swift, but it is so much smaller that it attracts but little attention. These hawks never alighted to rest while they were in our sight, and apparently were as fresh and vigorous as ever when they departed. We shot a few one day, and when they fell their feet seemed to be of no use to them, as one wing-tipped was unable to move after he reached the ground. Its general appearance is too well known to need description, but the comment of one of the party on the size of its mouth was that "if it opened that and flew in any direction there would be few insects that would escape falling into the cavern."

CURTIS.

THE CROW AS A GAME DESTROYER.

"WELL, what about the crow? Kill him every time you can get close enough to the thief to do it." That remark escaped my lips one day last June, when I was looking over a farming paper with a column and a half about the use of crows, explaining what great helps they were to the farmer, etc. The writer stated that crows were the greatest insect destroyers of all the birds, and that the amount of grubs, etc. they caught yearly was worth millions to the farmers of our country. "Well," I remarked to myself, "if what this writer says about the crow is so I must stop my triggers from pulling upon such noble helpmates of the farmers; but I had always regarded the crow as one of the farmers' worst enemies, and I believe so still and I have sent many a crow to the happy hunting ground."

Then as I stepped out into the yard I saw a crow, about two hundred yards from my house, busy eating something. "Insects of course," I remarked, calling to my mind the article I had just read, "well, I will see if I can find what the farmer's friend is eating." I went back into the house and took along my little rifle. Taking advantage of a fence which ran near by the thief I proceeded very cautiously until I got within about forty yards of his crowship. Resting the rifle on a rail and taking a careful aim I fired; one blast spoiled Mr. Crow's waistcoat beyond a doubt. Going up to where he lay I resolved to dissect him, and if I found his stomach full of worms and insects I would never shoot any more of his fellows.

The report of my rifle had brought my old setter to my side. Steady, old boy! What are you pointing for? Here's the old crow, if that is what you smell; and I threw the crow toward him; but still he held his point on a bunch of grass ten feet from where the dead crow lay, the crow having fluttered down the hill that distance. I went to the dog, but what a sight met my eyes! There, right at his nose, was a quail's nest with two or three young just hatched and one egg not hatched. The nest was lined with blood. I counted the shells around and found that eight birds had hatched; but where were they now? The nest showed signs of battle. There were quail feathers around it, which gave evidence of having just been plucked from the mother-bird. But who had driven the quail from the nest and murdered her babes? Could it be my old setter? No; he did not move until I went to him, and then he did not even touch the nest nor an egg. Well, who was the murderer? There he is, I said, as I cast a look at his mouth, stuffed with a young bird he was devouring when I shot him. Yes, the farmer's friend had broken up Mrs. Bob White's home, robbed her of her children, murdered them in cold blood and then devoured them.

I carried the crow to my dissecting room, an old shop near the house, and taking down my surgical instrument—an old corn knife—I soon dissected the bird, and found in his stomach all the young quail he had devoured when I shot him. Not a single worm nor insect did I find; nothing else but some young corn he had stolen out of my cornfield.

Now, you see, I am justifiable in saying shoot the crow. I have proof that the crows destroy here in Virginia many thousand young quail every year. They are very fond of eggs, and during the time the quail are laying and hatching, the crow is seeking his food in the very fields where the quail are nesting, and nothing escapes his watchful eye. A lady told me the other day that she rarely ever got any eggs from her guinea fowls, as the crows always found their nest and devoured the eggs. Crows also destroy thousands of bushels of corn in the fall of the year after the corn is cut down and shocked up; and in some portions of our county the corn has to be protected with the shotgun, and in the spring when the corn is planted they sometimes take up two-thirds of the field. I have known several farmers here in this section who have had to lay off their corn ground the second time and replant it because of the crows pulling up all the first planting. The crow not only destroys every quail's nest it finds, but every other small bird's nest it may come across. I have in the last year or two dissected more than a dozen crows, and from April to July I have found bluebirds, wrens, sparrows and mocking birds' eggs in their stomachs, but rarely have I found any insects or grubs. I think the sportsmen of Virginia and Maryland could not do a better thing for the quail, the song birds and the farmers than to shoot the crows.

THE CATAMOUNT OF THE PEAKS OF OTTER.

LIBERTY, Va.

THE CROWN OF THE KINGBIRD.

Editor Forest and Stream:

In connection with the current discussion in your natural history columns in regard to the use of the coronal decoration of the kingbird and other species, permit me to quote from a paper written by me in January, 1883, and published in the July number (of that year) of the "Journal of the Cincinnati Society of Natural History," viz.: "A List of the Birds of Bardstown, Nelson county, Kentucky."

"107*. *Tyrannus carolinensis* (L.) Temm.—Kingbird; Bee Martin. An abundant summer resident; arrives April 20. Several years ago, in May, I saw one of these birds occupying an exposed perch on a pear tree in bloom, about which many bees were darting. Several times I observed that he caught the insects without leaving his perch, by quickly turning his head and grabbing them. My attention being thoroughly aroused, I noticed that many of them seemed to fly directly toward the bird, the majority appearing to 'shy off' a short distance from him and change their courses, but very few escaped him. Did the thrifty *Hymenoptera* mistake the fully displayed crimson crown for a flower? Once since I have observed the same phenomenon."

In a recent edition of this paper, entirely rewritten, however, published during September by the Kentucky Geological Survey (a copy of which I forward to you), the following additional remarks are added, page 33:

"Mr. C. C. Nutting, who has spent considerable time studying the birds of Costa Rica and Nicaragua in their native haunts, states that he has seen *Muscivora mexicana* perched upon a twig and waving its curious and brilliant fan-shaped crest after the manner of a flower swayed by a gentle breeze, and thus attracting insects within reach. In fact the majority of the fly-catchers, a family that numerically reaches its greatest development in the neotropical region, have some lively-colored coronal decoration, which, perhaps, has been evolved for the special purpose above suggested. I understand that this subject has been discussed by Mr. H. K. Coale in a recent paper read before the Ridgway Ornithological Club, of Chicago, but I have not seen it, and am unaware whether or not he has touched upon this particular phase of the matter."

C. W. BECKHAM.

WASHINGTON, Oct. 5

KINGBIRDS AND BEES.—Tyringham, Mass.—Kingbird have nested withing twelve rods of my house for the past fifteen years, giving me a good chance to observe their habits. They are the poultry's best friend, not a hawk or crow would they allow to come anywhere near the house, thus saving me dollars in chickens. This is good of the birds so far, but it is said that they are bee eaters. I have also kept bees, and if I could have my way I would have a pair of kingbirds to every swarm of bees. I can safely say that no man ever saw a kingbird catch a honey bee. Before I knew this I believed, in common with others, that the bird was a bee destroyer, so sitting on the fence about eight feet from the hive I watched them dive into the midst of the bees, as they came out of the hive. This I saw them do time after time. Yes, with my own eyes I saw them go catch the bee and swallow it down. It seems to me that one's eye sight ought to be proof. But it is not, although I saw them as I supposed. You may well believe I was angry. The next thing to be done was to get rid of those birds. I went into the house, took down my muzzleloader, and shot three of them. Now for the proof. I opened those birds and found not a single honey bee in one of them, but in all three I found plenty of drones. Might not "J. L. D.," of Lockport, have mistaken a drone for a bumble bee? The drones fly high in the air, while the bumble and honey bee fly near the ground, for there is where their food is.—G. L. BARNES.

DRUMMING OF THE RUFFED GROUSE.—Decatur, Mich., Sept. 28.—In answers to correspondents in FOREST AND STREAM for Sept. 3 you say to "Jay Bebe" that the ruffed grouse drums every month during the year. I have lived all my life in Michigan and where I could hear them drum from one to four at a time, and I never heard one drum between the months of March and October. They begin drumming in April and continue about four or five weeks, and then nothing more is heard from them until some time in October. This second period lasts about the same length of time as that in the spring. I have known of them using one log, in a wood of twelve acres, for years; and never heard one drum on any other log in these woods. They have their particular logs to drum on and never choose any two very close to one another.—JOHN SMITH.

PURPLE GRACKLE NEAR PHILADELPHIA.—Manayunk, Phila., Oct. 1.—*Editor Forest and Stream:* In reply to "Homo's" answer regarding purple grackles nesting in and around Philadelphia, there is a nesting place in Leverington Cemetery, Roxborough, Phila., and from good authority I have it that they have nested there for fifteen or twenty years. I have taken sets of eggs for the last four years, and I estimate the number of birds to be from eighty to one hundred pairs.—ELLWOOD C. ERDIS.

SEPTEMBER ARRIVALS AT THE PHILADELPHIA ZOOLOGICAL GARDEN.—Purchased—Five rhesus macacques (*Macacus erythræus*), two bonnet macacques (*Macacus radiatus*), nine common macacques (*Macacus cynomolgus*), one green monkey (*Cercopithecus callitrichus*), one mitred monkey (*Semnopithecus mitratus*), one mandrill (*Cynocephalus mormon*), one black howler (*Nycetes niger*), two hairy-nosed wombats (*Phascolomys latifrons*), two Egyptian geese (*Chelanopex ægyptiaca*), one Amherst pheasant (*Thaumalea amherstiæ*), one Daubenton's curassow (*Crax daubentoni*), one Slater's curassow (*Crax slateri*), two rufous-vented guans (*Penelope cristata*), one festive amazon (*Chrysotis festiva*), and one pine snake (*Pityophis menanoleucus*). Presented—Two male and two female Angora goats (*Capra hircus*), one Virginia deer (*Cervus virginianus*), nine opossums (*Didelphis virginiana*), one king rail (*Rallus elegans*), one mocking bird (*Turdus polyglottus*), one pine snake (*Pityophis menanoleucus*), three alligators (*Alligato rmississippiensis*), two hog-nosed snakes (*Heterodon platyrhinos*), one copperhead snake (*Ancistrodon contortrix*), and one black snake (*Bascanion constrictor*). Bred in the Garden—One Carolina parrakeet (*Conurus carolinensis*).

THE CHOICE OF GUNS.—VII.

IN preceding articles nothing has been said of Lefaucheux action breechloading shotguns. When referring to guns of foreign manufacture, my attention was not directed to French guns made under the Lefaucheux system, but in comparing guns of American make with foreign guns, I have had special reference to snap-action guns of English make, for two reasons: First—All American-made guns belong to that family, and, second, American importations are usually English snap-action guns.

But it is proper I should say something of Lefaucheux action guns, and I know of no better way of presenting the arguments *pro* and *con* these guns than by publishing the following correspondence. It is but proper to say that the correspondence was not intended for publication, but upon my asking leave of my correspondent to publish his letter to me, with my reply, he kindly consented, and, in his letter of granting the permission, he replied to certain points made in my letter to him, and this reply is here also given.

I.

AH-PE—Dear Sir—I have been much pleased with your articles on the "Choice of Guns," now appearing in FOREST AND STREAM. As I suppose you are interested in everything pertaining to guns, I take the liberty of writing you this, and of calling your attention to what I think is an error in your article of Aug. 27. I also send you by this mail a catalogue of Chevalier & Dru, Paris, France. Please return it to me after reading the pages I shall refer to presently.

You state, "You cannot buy a reliable and durable imported gun at $50 or under." You are right if you refer only to snap-action guns or guns of English make. But are you aware that in this present time of hammerless and of repeating shotguns there are hundreds of thousands of sportsmen in France, and other countries (Spain, South America, etc.) who still use, in preference to all other guns, the old Lefaucheux positive action gun? These guns are now made and sold in France and are the guns most in use there. The Lefaucheux is there considered better than snap-action guns for the following reasons:

First—They are more durable and stronger, having no springs in the action to get out of order. There are no springs except in the locks.

Second—There is not the danger of the gun getting shaky, as happens sooner or later with any snap-action.

Third—They are cheaper; any one can make a Lefaucheux action, the patent having expired years ago.

The gun has the strength of the muzzleloader combined with the safety in loading of the breechloader. It, I know, is too old-fashioned ever to be adopted by our sportsmen, who care more for quickness and the latest fashion in guns than for durability and strength, and who will rashly sacrifice the latter qualities for anything new-fangled.

Now as to price. Wages are less in France than in England, and it costs much less to make the simple Lefaucheux than the snap-action guns. Also, as I said before, there is no royalty to pay and no monopoly in the Lefaucheux action. For those reasons and others (such as the greater economy of the French people, and consequently less demand for extravagantly high-priced guns) a first-class Lefaucheux action gun can be brought from France for less than $50. Chevalier & Dru, whose price list I send you, are among the very best gunmakers in France. On page 18 of the price list are the prices of Lefaucheux action pin-fire guns, which range in price from 100 francs up; and the prices of Lefaucheux center-fire guns range from 160 francs up. Now 100 francs is less than $20; 160 francs less than $32. (These guns are double barrel). On page 14 you will see that these makers guarantee their guns for five years. They will last a lifetime. These guns are first-class ones in every respect.

It would cost to import the $20 gun by itself as follows:

Cost of gun in Paris	$20 00
Transportation of gun to New York	3 00
Express company's charges, buying gun, getting it through custom house, etc	3 00
Thirty-five per cent. duty	7 50
	33.50

which is less than the $50 gun stated; and the $20 gun is stronger, safer and infinitely more durable than English snap-action guns that sell for $100 in New York.

I have written this letter as one fond of guns to a brother sportsman and because I don't like seeing some of the best qualities in a gun lost sight of in the mad rush for novelties. I have used breechloaders from the time they were first imported to this country, twenty-two years ago, and have tried about all the actions and I can sincerely say that for wear, strength and lasting qualities, none are as good as the old Lefaucheux action. Very truly yours, — —

II.

MY DEAR SIR—I beg to assure you that I thoroughly appreciate the sentiments in your letter of the 2d, and the motives which prompted you to write it and I thank you for writing. I have examined the catalogue of Chevalier & Dru which you so courteously sent me and herewith return it with my thanks. The catalogue has furnished me with information I did not before possess. I did not know the prices of the Lefaucheux guns were quite so low as they are.

On referring to the article in FOREST AND STREAM of Aug. 27, I am not so sure but your criticisms are, to a certain extent at least, well grounded. But taking the articles as a whole, you will see that I am writing of breechloading guns as they are now made, and especially of American guns. Standing alone, the assertion in the article of Aug. 27, that "you cannot buy a reliable or durable imported gun at $50 or under," is incorrect; but looked at in connection with the context, I hardly think an erroneous impression will be conveyed thereby. The concluding remarks of the article which appeared in FOREST AND STREAM of Aug. 20, and the prefatory remarks of the article in the issue of the 27th, in effect exclude from consideration the Lefaucheux action guns as well as the muzzleloader.

I have lately seen some very handsome and excellent muzzleloaders, that would have sold in the days of the muzzleloader for $200, offered at $50 and under. They were "reliable and durable imported guns," but, of course, do not come within the purview of the articles under discussion.

So, too, of the Lefaucheux action. Although I am ready to admit that my attention was not drawn to the subject when I wrote the words above quoted, still guns of this action are virtually excluded from consideration. Necessarily the system possesses great strength; but, in my view, guns made with this action are, with American sportsmen at least, as completely obsolete as the muzzleloader or as the pin-fire breechloader. The superior convenience and ease of manipulation of the top-snap action have forever displaced the Lefaucheux, and the action now in use will only give way before something more convenient and easy of manipulation than it is.

I am not, however, ready to admit that the Lefaucheux is necessarily stronger than a properly constructed top-snap, or will out-last it. Wear takes place with all actions, and the Lefaucheux is at best an exception only in degree. Even when made with double levers under fore-end and double bolts (as shown in MM. Chevalier & Dru's cut, page 19), the wear is a continuous thing. The friction is greater than in the top-snap; and I have seen Lafaucheux guns that had grown quite loose from use, the barrels having sprung away from the breech so as to allow gas to escape and cause the muzzle to droop; but I admit that the wear of the Lefaucheux does not usually make the gun quite so "shaky" as the wear of the average cheap top-snap action.

While the element of strength ought to be considered, it ought not to exclude other elements of value. The bowie knife is stronger than the pen knife, but a man would hardly cumber himself with the former when he had use only for the latter. The point of the stylus was not so apt to wear or be broken as the point of the pen with which I write, but the pen is decidedly more convenient and certainly an improvement on the stylus as a writing implement.

The cheap English top-snap action guns, with no device for taking up wear and that become useless on the breaking of the action spring, were and are open to serious objections. Even with these objections, however, I am not sure that their adoption to the exclusion of the Lefaucheux action was erroneous. And when we come to such American guns as those of Smith, Parker, Sneider and Lefever, we find them not only incomparably better than the single-bolted top-snaps of English make, but, as I believe, superior in every respect to any other guns that are made. After considerable experience with breechloaders, from the Lefaucheux forward, I am convinced that in soundness of the principles of construction, no guns are to be compared with American guns as recently improved and now made. Admitting that in the "rush for novelty," men overlooked the strength of the old Lefaucheux and adopted a weaker thing, the improvements which the ingenuity of American makers have wrought have made it strong enough, and its superior convenience is apparent. Take for example the Smith, in hammer guns, and the Lefever in hammerless (guns which stand, in my opinion, at the head of their respective classes in point of soundness of the principles of construction), and you will find that they are not only strong enough but ten times stronger than is absolutely necessary. And we will find in the best American guns a thing unknown to the Lefaucheux—provision made for taking up wear that must occur in every action. And in many respects the superiority of the improved top-snap action to the Lefaucheux might be shown. The points which I desire to make, however, in reply to your kind criticism are these:

First—While strength of action is a thing of great importance, it is not the only consideration. If two actions are strong enough, that one should be selected which is the more convenient and handy.

Second—The Lefaucheux action is as much a thing of the past as the muzzleloader, and the causes which produced its retirement were sufficient.

Third—The articles in FOREST AND STREAM only profess to deal with guns as now made according to the present state of the art of gunmaking, and it would be as futile to consider the Lefaucheux on account of its strength as it would be to treat of the muzzleloader on the same account.

Permit me to say that I only write in FOREST AND STREAM as a sportsman. I am not, and do not claim to be, an expert; but I give my views for what they are worth. In many respects they may not coincide with those of my brethren, and they may be erroneous. They are such as experience and observation have led me to form.

Again thanking you for your letter, I remain, yours truly,
AH-PE.

III.

MY DEAR SIR—Your interesting letter and price-list of Chevalier & Dru came yesterday. To-day I received yours of the 15th asking permission to publish in FOREST AND STREAM my letter to you. Although I expect to be ridiculed as an old fogy by some and pitied by others (some of them probably born since the introduction of breechloading guns), yet as you desire it, you have my consent to publish the letter in question, provided you also publish the following answers to certain points raised in your letter:

First—You draw a comparison between the stylus and pen, etc., derogatory to the former, strength alone being the criterion. But I claimed for the Lefaucheux action more than mere strength. I claimed that it combined the convenience of breechloading with the strength of the muzzleloader better than any gun I know of, and I am not a novice, having loved shooting before breechloading guns came into fashion in this country, and having a pretty good knowledge of the so-called "improvements" in the modern gun. The Lefaucheux action is amply quick enough for legitimate shooting. Of course the market-hunter, while ducks are flying fast, could kill more with a snap-action; but where slaughter alone is the object, a swivel gun or a cannon loaded with small shot will kill more in a given time.

Second—I hardly think it fair to state that the Lefaucheux action is obsolete—a thing of the past—and that it has become so on account of its inferiority to snap-actions; when the truth is, that thousands of sportsmen at this moment are using the Lefaucheux in France and other countries peopled with the Latin race, and prefer it to snap-actions, considering they have good reason for so doing.

It will not do for a liberal, fair-minded man to get around this by calling foreigners old-fashioned, behind the times, etc., and praising our sportsmen as the only go ahead people.

Third—You have been more fortunate than I in your experience with snap-actions. I have known an imported gun by one of the most celebrated English makers get shaky in less than eighteen months. This gun cost in New York $210, and had all the modern "improvements." I have been told of, but have not myself seen, two guns by an English maker (London) costing each over $350, with all the modern "improvements," get shaky in less than two years. One swallow does not make a summer. I merely mention these among a very great number of cases of snap actions getting shaky that I have known of. I have been told by some that it did not matter if the barrels of their snap-actions did get shaky. Perhaps not; it's a matter of taste; but I prefer more solidity in a gun, thinking it far more important than mere quicknesss of loading. I have yet to see the snap-action that will go through without damage or injury, what a Lefaucheux action will bear. Of course, no sane man expects to see the Lefaucheux used by our sportsmen to any extent, and the reason is that they rate too highly mere rapidity as compared with strength and solidity, and think too much of anything new in a gun that is christened an "improvement" by the gun makers and gun dealers. Very sincerely yours, — — —

Editor Forest and Stream:

The articles of "Ah-Pe" on the choice of guns are the best that have ever appeared in your columns. I wish to tender him and you my acknowledgments. The thanks of all lovers of the gun, I think, are due also. To say that such and such guns are worth the money, or safe and satisfactory, is well enough; but to minutely explain the make and action of each gun, and to show wherein one is superior to the other, is far better. When "Ah-Pe" is done there will be no further need, for some time to come, of essays on the much-worn subject, "Choice of Guns." There will, no doubt, be differences of opinion as to his conclusions, but the facts are there for the guidance of all. It is a mass of valuable information, and you and all sportsmen are to be congratulated that "Ah-Pe" has so excellently put it before your readers. S.

WIRE CARTRIDGES.

Editor Forest and Stream:

In your issue of Oct. 1 a communication appears by "N.," in which he desires information concerning the wire cartridge. Individually I have never used the wire cartridge. An unshakable fear prevented me from so doing, but from one who has used them I received the same wholesome advice as given to "N." by the gunsmith—let them alone, as they injure the gun barrel.

If "N." will give the thread-wound cartridges a fair trial, I feel convinced he will eventually adopt them permanently in his shooting. They are, I verily believe, as near, if not nearer perfection in the line of cartridge cases for the purpose than any in the market. Let "N." order and try the thread-wound case and report his opinion to FOREST AND STREAM. C. A. R.

PITTSBURGH, Pa.

Editor Forest and Stream:

I used Ely's wire cartridges, BB shot, extensively in a No. 7 muzzleloading duck gun before the advent of breechloaders. I generally shot an open charge in right barrel, wire cartridge in left. The result was that the left barrel was so worn that eventually I had to load with No. 6 wads in it. I did not see that the shooting of that barrel was at all impaired or the barrel was otherwise injured.

I will be obliged if Mr. Clapham will say where the "ulesote" bottom paint can be had. ACCOMAC.

WACHA PREAGUE, Accomac County, Va.

THE ST. LOUIS CONVENTION.

THE sportsmen who met at St. Louis last week organized a new national association, passed a very commendable series of resolutions, and laid out an elaborate scheme of work for the future. The spirit shown and the sentiments expressed were for the most part worthy of the highest praise. The undertaking, to the accomplishment of which the members of the association have set themselves, may appear to experienced persons as somewhat visionary; but there is no denying that its attainment of a system of uniform game laws would be a most desirable consummation. If those individuals who have had most experience in working for suitable game legislation are disposed to look somewhat dubiously upon the bright picture of the future as painted by the enthusiasm of the St. Louis game protectors, it must not be forgotten that even should the effort of the convention now cease entirely, the influence of the meeting is most salutary. The gathering of such a number of men, the discussion of game interests, the daily newspaper reports, and the press dispatches, all combine to draw public attention to the subject of game protection. The St. Louis convention has already accomplished some good. What it will do in the future will depend altogether upon the earnest, systematic, individual efforts of its officers and members.

TUESDAY, SEPT. 29.

At 10:30 the convention was called to order by Capt. H. C. West, chairman of the committee of arrangements. He read to the meeting the original call.

Gen. Jackson L. Smith, of Jefferson City, the temporary chairman, taking the chair amid applause, called the meeting to order and on behalf of the State Association welcomed the visitors. He indulged the hope that the presence of so many sportsmen gave every promise of beneficial results as to game legislation. This, the speaker said, was the first convention ever held of the kind and its importance could not be overestimated. An examination of the game laws of other States showed how all varied and the results of the discrepancies were patently unjust to all. The chairman specially alluded to the present position in Missouri as to the close season of prairie chickens, pointing out the anomaly of grouse being allowed to be shot, marketed and eaten all around us, while Missouri had to sit by and hungrily watch these processes going on. Such a law invited breaches. How was uniformity to be obtained? Congress could not as yet interfere, for the game belonged primarily to each State, and the only profitable present action would consist in the obtaining of precisely similar legislation by each and every State. The work and influence of the convention could obtain that end. We of the convention should all work vigorously to obtain it. The meeting had a right to invoke the further aid of the public press, to which it was already so much indebted and which was always ready to help on any scheme for the good of the people. Let this meeting, continued the General, formulate a bill and press its clauses first on those States which have no game laws, and, secondly, on those others which were already partly in line. The speaker thought that a uniform opening date should be one of the first points to be adopted. This would restrict the present indiscriminate rate of slaughter. In some States laws had not long since been enacted by which game was not allowed to be shipped out, a course prompted by an illiberality and unsportsmanlike spirit to which every sportsman should be a stranger. He thought himself that the stopping of entry of game legally killed in one State to another was unconstitutional, and he considered that no State had the right to prevent a citizen of another from hunting within its border. He regretted to have to add that a recent enactment of such a nature had been passed as regards this State, and he believed he was not alone in thinking the law to be a standing reproach to every Missourian. As to the fish questions to be discussed, the speaker personally would prefer to first look to any means for the destruction of the gar and the hard-shell turtle, those insatiable pirates and enemies of all of man's fish food. There were many other points to consider as to this part of the subject to be discussed by the convention, but he felt that this would be considered with the greatest intelligence by others, and he would therefore close with once more heartily welcoming the delegates. Gen. Smith resumed his seat amid great applause, and his remarks as to the selfishness of retaining game in a State after being shot, and of keeping sportsmen out of a State, earned for him vigorous commendation.

Capt. West then appointed Dr. R. M. Swander as acting secretary, and J. G. Schaaf as his assistant. The secretary, on motion of John D. Johnson, read the names of the delegates present. They were:

Illinois—E. J. Brown, Quincy Gun Club; E. Kerles, Belleville Gun Club; A. J. Fleischman, Belleville Rod and Gun Club; Chas. Henry and Ed Vickery, Audubon Gun Club, Jacksonville; R. H. Mann, Chester Game and Fish Protective Association; T. P. Bartlett, Quincy Fishing Club; R. J. Slice, Central Illinois Sportsmen's Association; O. P. Bortall, Secretary Illinois Fish Commission; H. H. Fahnestock, Illinois Valley Gun Club, Peoria; Henry Saltat and D. T. Shipp, Waterloo Gun Club; F. W. Herbst and Strauss, Shiloh Valley Gun Club; O. W. Reed, Taylorville Gun Club; Geo. Crosby, Duquoin Gun Club; Fred A. Allen, Monmouth; D. Schroll, Meredosia Fishing Club.

Arkansas—A. R. Smith, Excelsior Gun Club, Hot Springs; W. J. Echols, James A. Gautis, Western Gun Club, Fort Smith.

Iowa—E. H. Carpenter and U. S. Young, Crystal Lake and Eagle Grove Gun Club, Burlington; John F. Gregg, Burlington Shooting Club; C. W. Budd and G. W. Griffey, Des Moines Gun Club; J. T. Brutenstcine, Nimrod Club, Keokuk.

Kansas—L. G. Perry and W. A. Irwin, State Sportsmen's Association; E. L. Shaffer, Council Grove Gun Club.

Missouri—L. D. Dozier and Frank Carter, Dardenne Shooting Club; J. S. Bell and J. W. Lemonist, Palmyra Sportsmen's Club; F. Hermann and L. E. Kaltwasser, Diana Hunting Club, St. Louis; H. C. West and A. G. Gates, St. Louis Fish and Game Preserve; J. B. Schulte, J. W. Fisher, J. P. Shaff, Excelsior Gun Club, St. Louis; John D. Johnson, St. Louis Gun Club; M. F. Taylor, Winfield Gun Club; J. L. Smith and W. Q. Dallmyer, Jefferson City Gun Club; Alex. Sweathers and Albert Cohen, Hannibal Gun Club; John K. McDearmon and J. W. Avery, St. Charles Hunting and Fishing Club; Judge P. S. Lanham and George Bain, Murdock Lake Hunting and Fishing Club; H. Hospas, William Kampheimer, Fred McCarty, Western Hunting Club, St. Louis; M. K. McGrath, White River Fishing Club.

Kentucky—J. M. Taylor, Lexington Gun Club; J. M. Barbour, Kentucky State Sportsmen's Association; James W. Harrington, Shelbyville Gun Club.

At Large—Kent County Sportsmen's Club, Grand Rapids, Mich., Dr. E. S. Holmes; Cuvier Club of Cincinnati, J. T. Blackburn and John R. Chamberlain; El Paso Gun Club of Texas, W. H. Irwin; Redfield Gun Club, Dakota Territory, W. A. James.

Fish Commissioners—Enoch W. Moore of Delaware; P. Dunning and J. V. Jones of Wisconsin; Dr. E. S. Holmes of Michigan; H. H. Rottaken, Little Rock, Ark.

Game Dealers' Representation—J. A. R. Elliott, Grenola, Kan.; J. W. Peters, St. Louis; W. W. Judy, St. Louis; L. S. Carter, Hammond, Ill.; Fred A. Allen; Monmouth, Ill.; D. Schroll, Meredosia, Ill.

There was some little discussion about the advisability of admitting fish commissioners and game dealers as members of the convention. The motion to admit them, however, was finally carried unanimously.

Mr. John D. Johnson moved that the usual committee on credentials be dispensed with. This was carried unanimously, saving much time.

Messrs. R. H. Mann, Illinois; J. B. Jones, Wisconsin; J. A. Yantis, Arkansas; J. P. Barbour, Kentucky; W. A. Jones, Dakota; Mortimer Taylor and John D. Johnson, of Missouri, were appointed by the chairman as a Committee on Permanent Organization. A recess was then taken until 2 o'clock in the afternoon. When the convention reassembled at 2 o'clock the Committee on Permanent Organization and Order of Business made the following report, which was adopted: For Permanent President, John D. Johnson, of St. Louis; First Vice-President, Enoch Moore, of Delaware; Second Vice-President, Henry Talbot, of Illinois; Secretary Capt. H. C. West, of St. Louis; Assistant Secretary, Joseph Wherry, of St. Louis; Sergeant-at-Arms, Hunt Wilson, of St. Louis; Committee on Resolutions, Hon. Jackson L. Smith, of Missouri; Col. H. H. Rottaken, of Arkansas; Maj. J. M. Taylor, of Kentucky; Philo Downing, of Wisconsin; Dr. N. Rowe, of Chicago; J. F. Blackburn, of Ohio, and W. W. Judy, of St. Louis.

Mr. Johnson was escorted to the chair by a committee of three. In resigning his place as temporary chairman, Mr. Smith remarked that Mr. Johnson was no stranger to the members of the convention or to the game and fish concerning which they had met to consult. Mr. Johnson was received with a hearty round of applause. He expressed his thanks for the compliment bestowed upon him, and at once launched into a well considered speech on the necessity for uniform game laws, uniform close seasons, and a determined effort on the part of sportsmen to see the game laws enforced. He remarked that the first sportsmen's convention met at Niagara Falls, N. Y., in 1873, and did a great deal toward creating a proper public sentiment on this important subject. As a result of that convention game laws were enacted in several States. Unfortunately, however, the organization then effected lasted but two years, but the influence was still apparent all over the country. Meetings of this character, continued Mr. Johnson, had a beneficial effect on the country at large. The time had arrived for further legislation, for the better protection of fish and game, and he was confident that the convention could make suggestions to the statesmen that would result in improved fish and game laws.

A long communication was read from M. R. French, President of the American Association for the Protection of Game, Game-dealers and Consumers, pointing out the necessity for uniform legislation relating to fish and game. The letter concluded by stating that purely destructive sport, like the shooting of deer in August, is unmanly and unjustifiable, and equally wrong is the unseasonable and improper slaughter of game solely for market.

Dr. Steedman offered a package of letters from various fish commissioners which were ordered placed among the records of the convention.

Mr. Taylor introduced a resolution urging the passage of uniform game laws in the various States.

Another resolution was read by the secretary urging: 1. That uniform close and seasons should be adopted in the several States and Territories east of the Rocky Mountains for deer, turkeys, pinnated grouse, ruffed grouse, quail, woodcock, wild ducks, wild geese, Wilson snipe, squirrel and rabbits, and that said close seasons should cover the breeding periods of said animals and birds, and such additional time as is necessary to prevent a further reduction of the present numbers of the same regardless of latitude. 2. That said close seasons should be as follows: For deer, from Dec. 1 to Aug. 15; for turkey, Feb. 1 to Sept. 1; for pinnated grouse, Dec. 1 to Sept. 1; for ruffed grouse, Jan. 1 to Sept. 1; for quail, Feb. 1 to Nov. 1; for woodcock, Jan. 1 to Sept. 1; for wild ducks, Feb. 1 to Sept. 1; for wild geese, Feb. 1 to Sept. 1; for Wilson snipe, Feb. 1 to Sept. 1; for squirrel, Dec. 1 to June 1. These documents were referred to the committee on resolutions, which was increased in membership, because of the large amount of work it has to perform.

On motion of Mr. George Bain, Messrs. Steedman, Dunning, Bain, Enoch Moore and S. P. Bartlett were appointed a committee to pay particular attention to the protection of fish.

It was decided after some discussion to take the sense of the convention on the close seasons. The general view was that the close season for deer should be from Jan. 1 to Oct. 1; for pinnated and ruffed grouse, Jan. 1 to Sept. 1; for quail, Oct. 15 to Jan. 1; for woodcock, Jan. 1 to July 4. The other close seasons were left as named in the resolution.

Mr. Theodore Pilger offered a resolution, which was referred to the committee, that no gun larger than a No. 10 bore be allowed to be used by sportsmen.

An invitation from President Haarstick, of the Merchants' Exchange, to visit the Exchange was unanimously accepted and noon to-day set for the visit.

M. F. Taylor, of St. Louis; Mr. Holmes, of Michigan; Mr. Zaulis, of Arkansas; Gus. Griffey, of Iowa, and Col. Dallmeyer, of Missouri, were appointed a committee to formulate a scheme for the organization of a National Sportsmen's Association.

WEDNESDAY, SEPT. 30.

The convention assembled at 10:30, J. D. Johnson in the chair. The first business was the report of the Committee on the Protection of Fish, which was as follows:

"Your committee, to whom was referred resolutions relating to fish protection and propagation, beg leave to submit the following recommendations for the action of the convention:

"That the catching of game and food fishes should be prohibited in the public waters of the different States during the spawning seasons, except for purposes of propagation or distribution by or under the direction of the Fish Commissioners.

"That the prohibited periods should, as far as practicable, be uniform and of sufficient duration to include the spawning periods in all these States of the same species of fish, say for spring spawners from Feb. 1 to Aug. 1, and for fall spawners from Sept. 1 to April 1, excepting migratory fish, and that the close season for such should be regulated by the several States in which they are found.

"That all obstructions to the ingress or egress of fish to and from their spawning grounds in streams and lakes should be prohibited, and the construction of proper fishways over dams required and regulated, and that the Fish Commissioners should be the judges as to what shall constitute a proper and sufficient fishway. The expense of putting in and maintaining such fishway shall be borne by the owner of such obstruction or dam.

"That no seine, net, trap, weir or other device for catching fish should be permitted to be used, where it is legal to use them, whose mesh is less than two inches square. That illegal seines, nets, weirs or other devices should be confiscated and destroyed wherever found.

"That the propagation and protection of fish and game, and the enforcement of all laws applicable to the same, should in each State be placed in the hands of a paid commission composed of one or more competent persons; that such commission should be authorized to appoint deputies or wardens throughout their respective States with power to institute prosecutions or make arrests, as circumstances require, under the supervision of the commission; that our respective legislatures be requested to recommend the passage of such national legislation as will regulate the menhaden and other fisheries along the Atlantic coast and great lakes."

Signed I. G.W. Steedman, Philo Downing, Enoch Moore, S. P. Bartlett, George Bain.

Mr. Jones, Fish Commissioner of Wisconsin, deprecated the use of dynamite in fishing, and urged that it should be made a penitentiary offense. Mr. Mann, of Chester, Ill., moved that the size of the meshes of the seines be fixed at two and a half inches instead of two inches. Messrs. Bartlett and Peters were of the opinion that a two-ineh mesh is large enough for all practical purposes. The convention, however, decided to let the committee's report on this matter stand. Mr. McAdams, of Illinois, offered a resolution, which was adopted urging Congress to provide such legislation for the preservation of fishes in the Mississippi and other public waters of the United States not controlled by State legislation as will be in harmony with the objects of this convention. Mr. Jones renewed his protest against the use of dynamite and other explosives and poisons in fishing. Mr. E. S. Holmes, of Michigan, suggested that a reasonable bounty should be paid for the destruction of predatory fish and animals that are not useful for food, such as gars, dogfish and hard-shell turtles. It was intimated that there might be some difficulty about getting money for this object, but the objection was not seriously entertained and the resolution was passed.

On the chairman calling for the report of the committee on game and that on organization of a permanent association, Mr. Yantis, of Arkansas, read a report from the latter as follows: "It is recommended that this convention take a recess so soon after final action upon the reports of the two committees now out for half an hour. That thereupon all members of organized game and fish clubs retain their seats, organize themselves into a caucus and pass upon the constitution herewith submitted proposed for the National Association. Your committee further recommend that upon the adjournment of this convention all the records of this convention be given to the National Association, and that all clubs represented be requested to come forward and become members of the National Association." On motion by Mr. Bain this was lost, the game committee not having yet reported.

An attempt was then made to ascertain, as fully as possible, the total number of members of the different hunting, gun and fishing clubs which had fallen into line with the objects of the convention, or who were represented thereat. A call was made in this view, representatives giving the census of their membership. It transpired during the call that there are 500 members of the Cuvier club of Cincinnati, and that there are 650 members of the Delaware Game Protective Association. With a great many clubs yet to be heard from, a total of 4,478 members was arrived at.

Gen. I. S. Smith, chairman of the Committee on Resolutions relating to the protection of game, presented the following report:

"That in the opinion of your committee the close and open seasons should be adopted in the several States and Territories east of the Rocky Mountains: For deer, turkeys, pinnated grouse, quail, woodcock, wild duck, wild goose, Wilson snipe, pigeon dove, upland plover, rabbit and squirrel, and that said close seasons should cover the breeding period of said animals and birds, and such additional time as is necessary to prevent a further reduction of the present number of the same, and that the close seasons shall be as follows: For deer, from Jan. 1 to Oct. 1; turkey, Jan. 1 to Oct. 1; pinnated and ruffed grouse, Jan. 1 to Sept. 1; duck, Feb. 1 to Sept. 1; geese, Feb. 1 to Sept. 1; Wilson snipe, May 1 to Sept. 1; woodcock, Jan. 1 to July 4; plover, May 1 to Sept. 1; turtle dove, July 1 to Aug. 1; wild pigeon, April 1 to Oct. 1; squirrel, Jan. 1 to June 1; rabbit (excepting jack rabbit), from Feb. 1 to Oct. 1.

"That hunting of deer with hounds should be prohibited at all seasons in all States. That song and insectivorous birds should be protected the year round. That the trapping, ensnaring and netting of game, insectivorous and song birds (excepting for scientific purposes) should be entirely prohibited. That the robbing of the nests of any birds mentioned in the preceding paragraph or the interference with them while nesting or rearing the young should be prohibited under severe penalties imposed by law. That the killing or catching of any animal or birds hereinbefore mentioned by night should be forbidden by law. That no gun of a larger gauge or caliber than No. 10 should be used in the pursuit and capture of any kind of game.

"That it is the further deliberate opinion of your committee that it would subserve a wise and useful purpose to unite and blend the twin interests of fish and game and to devote the duty and functions of protecting and preserving the same on one class of public officers; that the Fish Commissioners of the several States ought to have superadded to their duties and functions the protection and preservation of game as well as fish; that the Governors of the several States and Territorios should be authorized by statutes to appoint one game and fish warden for each Congressional District, and that such game wardens be authorized to appoint one or more deputies in the several counties within his Congressional District; that said game and fish wardens and their deputies be under the supervision and direction of the said Game and Fish Commissioners; that all of said officers be authorized and empowered to institute and prosecute all proper criminal actions for infraction of the laws

for the protection of game or fish; that the game and fish wardens receive an annual salary to be paid them by the State; that the deputy game and fish wardens receive as their compensation one-half of the net proceeds of all fines and penalties which shall be recovered through their instrumentality.

"That it is the opinion of your committee that the greed for large bags is destroying the game of the country; that while large bags are an exhibition of skill in the use of the gun they are not sportsmanlike and bring sportsmanship to the level of pot-hunting, and are in direct conflict with the characteristics of a sportsman, the chief principle of which should be the protection of game. Therefore we recommend that each individual be limited to twenty-five birds, other than ducks and snipe, a day, and that the limit for ducks and snipe should be fifty a day."

The committee recommends the formation of a national sportsman's association for the protection of game and fish, and that as a part of it there should be appointed a committee to prepare proper laws and press the passage of the same by all honorable means.

Gen. Smith explained that the report was not the unanimous expression of the committee. They had endeavored to occupy high grounds upon those great economical and moral questions, and if they had not met the expectations of the convention they regretted the fact. He was aware that the minority was composed of honorable, whole-souled sportsmen, but they were men of strong assertion and could not be swayed from their convictions. Mr. Hauworth, of Quincy, then stated that he was one of the minority. The committee had held a protracted meeting last night and had finally agreed to a unanimous vote, although there was a difference of opinion of six to three at its deliberations. The point at issue was on spring shooting of wildfowl and snipe. The sense of the convention had been that wildfowl shooting should close on Feb. 1, but at last night's meeting of the committee a compromise had been effected by the agreement that on the date of the open season on geese, ducks and snipe being extended to April 15, the minority would make all of the report unanimous. The compromise had, however, been overruled at a subsequent meeting of the committee. It being noon when Mr. Hauworth closed his remarks, the convention adjourned in order to visit the Merchants' Exchange in a body.

Chairman Johnson rapped the meeting to order at 2:30 P. M., and at once called for the report of the committee on game. It was asked by the chair whether a minority report had been prepared in writing by the three members who were in dissent with the majority. As this proved not be the case, Mr. Johnson decided that Mr. Hauworth's verbal expression, as detailed above, could not be accepted in lieu of a document, and the committee's report was then gone into in detail, the sense of the meeting being taken clause by clause seriatim. The close dates, as to deer, turkey, grouse and quail passed as proposed, but a lively fight came on when it was considered whether the close season on ducks and geese should extend from Feb. 1 to Sept. 1.

Mr. Hauworth moved that the dates be altered to from April 15 to Sept. 1. Mr. James was not in favor of the total abolition of spring shooting, but believed in preventing the wholesale destruction of game not only in the spring but in the fall. If that was done there would be good shooting both in the spring and fall. Gen. Smith was of opinion that the question at issue was one for the naturalists to consider, and that the sole object of the convention was the protection of game birds during their time of reproduction. When birds took their flight to the north, the process of reproduction had begun, and it was wrong to shoot them in the spring, since they violated the underlying principle of the convention, which was to protect and preserve game of all kinds. Mr. Bailey declared that he was in favor of shooting ducks in every latitude at any time, providing the shooting was done in a sportsmanlike manner. Mr. Zantiss intimated that such a view was neither moral nor sportsmanlike, but Mr. Baily took issue at once with the idea that the birds come north only to breed. "They come north," he stated, "because of the temperature and not solely for breeding purposes." This bold assertion tempted Mr. Zantiss to smile audibly, in which act he was joined by several other members of the convention, but Mr. Bailey stood his ground manfully and maintained that he was right in stating that the ducks go north for a summer vacation. Several amendments were rejected, and the season for duck shooting left as reported by the committee.

Debate on the other clauses then followed. Mr. Holmes, Michigan, was opposed to the date fixed for the close season for woodcock. He thought the time should be changed from July to Sept. 1, and offered an amendment to that effect. "During July," he said, "the woodcock is a poor weak bantling. The old birds have not recuperated from the arduous labors of breeding, and are neither fit to eat nor a proper target for sportsmen." Mr. Young emphatically said that Mr. Holmes was evidently not familiar with woodcock, or he would know that the birds were grubbing before the latter part of July or beginning of August. "I would not give the snap of my finger for a woodcock after August," said he, "because grubbing spoils his meat." The time was left as fixed by the committee. When the clause affecting rabbits was reached, a season of excitement ensued. The rabbit did not seem to have many friends in the convention. "Kill him all the time," shouted Mr. Geo. Bain, "he is not a game bird." The clause on plover was carried as were those on turtle doves, wild pigeon and squirrel, Judge Lanham remarking with the water running out of his mouth that the last named are the best eating at the last of June, when the mulberries are ripe.

The clause respecting the hounding of deer met with an amendment offered by Mr. Terry, of St. Louis, to except Arkansas, Louisiana, Mississippi and Missouri from its provision. The gentleman thought a deer should never be stalked or killed by fire-hunting. The animal should have fair play in the shape of whatever warning is given to it by the bay of a hound, and moreover those parts of the States he referred to which harbor deer for most of the year are swamp lands and thickets in which deer cannot be hunted except with the aid of dogs. Mortimer Taylor, of St. Louis, considered that it was only the lazy man who hunted deer with hounds and not the sportsman. There was no sport in standing behind a tree and letting drive at a poor big beast as big as a donkey and headed to that point by hounds. Mr. Yantis, of Arkansas, loved the music of the hounds and looked on the man who sneaked alone through a wood, stalked a deer and shot it standing, as a murderer. Mr. Taylor thought that Mr. Yantis was incorrect in one of his illustrations, and on that gentleman differing with him, feared that his (Mr. Yantis's) specimen hunters may occasionally have suffered from buck fever. Prof. Holmes stated that the people of Michigan had arrived at the conclusion that a still-hunter killed on the average five deer a day, while the man with hounds killed only one in eight days. Mr. McDonough drew attention to the fact that still-hunting included baiting and sitting over a salt hole and shooting all the deer that came along. The clause was struck from the report on vote by twenty-five to twenty-three.

The section respecting song and insectivorous birds was carried. That concerning their trapping was also carried, a provision being added to the effect that birds may be caught for propagating purposes, and another, that birds may be taken for scientific purposes by shooting. The clause relating to giving protection to nesting birds was adopted, as was that prohibiting capture of any birds at night.

The clause restricting the caliber of guns to No. 10 was carried.

The clause recommending the blending of present fish and future game commissions, appointment of wardens, etc., came next. Mr. Fahnestock was of opinion that the salary of the deputy wardens should be paid by States like those of the wardens. Mr. Bain thought that this would be the business of the legislatures. Dr. Steedman considered that fish and game commissioners also should be paid. They had given services gratuitously for fifteen years, and the speaker therefore had ample cause to suppose that the time had now arrived when those officials should receive compensation. The clause was amended by the addition of commissioners and deptuty wardens to the wardens on the list of officials to be paid by the different States and was then adopted. The suggestion that a national association with sub-committee to press the passage of laws was adopted.

Some debate took place on the restriction of the bags of sportsmen to a certain number of lives a day, and it was finally ruled that not more than twenty-five snipe, duck, teal, quail or grouse should be shot in a day by any hunter.

A motion by Judge Lanham and George Bain that sportsmen be invited not to string or take home croppie or striped bass of less than nine, black bass of less than eleven or jack salmon of less than twelve inches in length was adopted amid some laughter, though these are the lengths to which the members of the Murdock Lake Club restrict themselves.

The following motion was then put by Mr. Yantis, of Arkansas, and adopted: "Whereas, it has been represented to this convention that an indiscriminate slaughter of game is constantly going on in the Indian Territory regardless of seasons; and, whereas, there are no present means of preventing the same save through the instrumentality of the Indian authorities; therefore, it is resolved that clubs bordering on the said Territory, having for their object the protection of game, be requested to correspond with the Indian authorities and make such arrangements as may be most conducive to the protection of game in the Indian Territory."

The following report of the committee appointed to draw up a scheme for a national association was then called up. It is reproduced in a condensed form:

REPORT OF PERMANENT ORGANIZATION.

We, your committee, would report that in our opinion this convention should organize a national association for the protection of game and fish, and would submit the constitution herewith filed as suitable for the organized laws of the same. We would further suggest that the officers for the same be elected by this convention for the ensuing year, and that when this convention adjourn that the records hereof be placed in the custody of said association.

1. Objects.—Protection and increase of game and fish, and the bringing about the enactment of uniform laws by the general government and those of States for those purposes.

2. It to be named the National Association for the Protection of Game and Fish.

3. Clubs of the present or future founded on the same view as the association to be eligible for membership. Fish and game commissioners to be admitted to ex-officio membership without dues.

4. The officers to be a president, a vice-president, a secretary and treasurer, and for each State and Territory a vice-president and assistant secretary. The president of each State association to be accepted annually as a vice-president, and its secretary as assistant secretary. Officers to meet annually.

5. The executive committee may accept or reject applications of clubs for membership.

6. The annual dues of clubs of twenty or more members to be $10; of those of ten, $5.

7. An annual meeting shall be held, one month's written notice of the place of holding to be given by the secretary on order of the president.

8. Clubs of twenty members are entitled to two delegates, of a less membership one.

9. The standing executive committee shall consist of the president, all the vice presidents, secretary and treasurer and two persons to be appointed by the president, five to constitute a quorum. The executive committee shall manage the ordinary affairs of the Association, reporting at annual meetings.

10. There shall be a standing law committee of five persons, appointed by the president, and who shall consider all legal questions affecting the association.

11. The president's powers are defined in this section, and are of the usual nature. In his absence the first vice-president shall exercise his functions. The president shall appoint the secretary and treasurer and take satisfactory bond for his guarantee.

12. The secretary and treasurer who serves under bond, shall reside at the same place as the president and shall perform his duties in the usual way. His salary to be fixed by the executive committee.

13. Twenty-five members at an annual meeting shall constitute a quorum.

14. The executive committee has power to make by-laws.

15. Proposed amendments must be submitted in writing a month before action can be taken.

Motion was made that the report be adopted entire, which was done by a unanimous vote.

The chair was directed by vote to appoint a committee of five to draw up resolutions explaining the proceedings and to publish the same to the United States.

John D. Johnson was elected President of the association by acclamation. Enoch Moore, of Wilmington, Del., was chosen Vice-President. Secretary, H. C. West, of St. Louis.

It was decided that all clubs represented at the convention shall become members of the association by paying the required initiation fees.

Mr. Hayden offered a resolution, which was adopted, recommending that all States and Territories offer bounties for the destruction of hawks that prey upon game.

Mr. Jones, Fish Commissioner of Wisconsin, made a brief speech of thanks to the local committee, remarking that the proceedings of the convention would result in raising the standard of American sport.

After considerable discussion it was decided to hold the next meeting of the association on the first Tuesday in June, 1886, at Chicago, at 6:45 P. M. The convention adjourned *sine die*.

Thursday and Friday were devoted to trap-shooting at the Cole Brilliante race course, and there was a banquet on Thursday afternoon.

THREAD-WOUND CARTRIDGES.—Will some reader of the FOREST AND STREAM who has tried the thread-wound, long-ranged shot cartridges, give me their opinion of them in regard to pattern and penetration. Also if considered good to be used in a chokebore gun.—NIMROD.

ADIRONDACK NOTES.

Editor Forest and Stream:

I have just returned from an extensive trip through the Adirondack Lake region, commencing at the Forge House, extending through both Saranacs to Paul Smith, thence back to Raquette and Blue Mountain Lake by way of the Tuppers, and I have to say that I have scarcely passed a lake or pond on which watchers for deer, or dogs to be taken out, or actually running deer, or as in a few cases deer floating in the water with a bullet hole through their heads, in short, some positive evidence of the flagrant violation of the hounding law could not be observed. Moreover, everybody freely confesses that it is not meant to observe the law, and that it is the American way, to let everybody grab for what is left of game and fish while it lasts. No one expects that it will last long. My personal impression about it is that the obstacles to the enforcement of such a law are insurmountable, and that a law without the necessary force behind it is more ruinous than no law at all, because it makes no end of hypocrites of those who disobey it. I should hail with delight some remedy which could protect what is left of our game and fish, and of our once magnificent woods too, for that matter. But the modes prevailing in the government, the hopeless rascality of our professional politicians (a large portion of whom, by the way, pretend to be sportsmen), and chief of all, the indifference of the public regarding the subject, will frustrate every effort in that direction.

From four weeks' life in the woods I may say that deer and partridge seem to be fairly abundant in the more remote parts of the forest. Raquette Lake is teeming with black bass of a very small size, yielding a poor apology for sport. The hotels are mostly abominations as regards comfort or fare, a hollow pretense to be shunned by those who know how to camp out. The guides are fast becoming simple oarsmen, losing their former fame for woodcraft. The younger ones hardly know how to handle an axe, sometimes have great difficulty to find a well-trodden path, say nothing of a blazed line, know nothing of cooking, and groan in a fashion to inspire pity when there is a carry of more than a half mile ahead. They are comparable to forest hacks who also serve for hotel runners.

This letter may be too gloomy, but does certainly contain an unshakable basis of fact, admitted by everybody who saw the woods fifteen years ago. Of course I know that we are getting ahead in civilization, and that we must pay for the improvements, but the heart that saw the forests in their primeval beauty aches, nevertheless, seeing this senseless destruction, waste and ruin, going hand in hand with the appearance of the lumberman, guide, hotel man, and, worst of all, the city sportsman, who, with money, might, and main, slaughters the rest of the game, corrupts the guide, burns the woods, and disfigures the face of the earth with his gluttonous habits transferred to the woods, giving pabulum to the excrescences called hotels. It is curious to see how the woodsman hates the city dwellers and *vice versa*. Each thinks the other a rascal and fraud, and generally both are right. But what is the use of crying woe? Let us be glad that there still is a haunch of venison and a mess of fish for those who know how to get them. *Après nous le déluge!*

NEW YORK, Oct. 3, 1885. MUSQUASH.

PHILADELPHIA NOTES.

UNFAVORABLE winds, low tides and rainy weather prevented good rail shooting during the past week. There is no lack of birds, but they cannot be reached without plenty of water. The reeds have been well beaten down and pushing a skiff is very hard work. Nothing but a storm tide will allow a boat to go freely over them.

Teal are still reaching our waters in increased numbers, and some good decoying just at daybreak was had during the week, off the point of Raccoon Creek, on the New Jersey side of the Delaware. After the sun is well up it is useless to try to decoy longer, as the ducks appear to be on the move only in the early morning.

Snipe are becoming plentiful, comparatively speaking, in fact, shooting for them hereabouts is always much better in the autumn than in the spring, when they first arrive; but owing to the rail, reed birds and teal which attract the sportsman's attention at this time, the snipe seem to be lost sight of and are seldom regularly hunted, but merely killed when they are found while in pursuit of the more numerous birds. Woodcock also are ofttimes found when one is rail shooting, especially if the skiff can be pushed up to the alder-fringed meadow bank.

Quail are more plentiful in Pennsylvania, New Jersey, Maryland and Delaware than last year and appear to have bred well. It is reported from some counties that many of the broods are composed of small birds. I think such birds are those of a second hatching, for Bob White has certainly had a good nesting season thus far.

Ruffed grouse are fairly plentiful through the Lehigh Valley, but the birds are still on the table lands, with plenty of food to keep them there until cold weather and frost drive them into the more sheltered ravines. HOMO.

PHILADELPHIA, Oct. 4.

MOOSE IN MUSKOKA.

Editor Forest and Stream:

Two weeks ago, on my way into the Muskoka country on my third annual tour, I had the pleasure of meeting at Muskoka Wharf a fine two-year female moose. It was captured alive by an Indian hunter north of Rosseau, and was being shipped to Toronto, where it had been purchased by the directors of the zoological garden of that city. This animal, although a little thin in flesh, was apparently in good health, and seemed entirely indifferent to the curious crowd that surrounded her box. A gentleman living at Gravenhurst (one-half mile south of Muskoka Wharf) informed me that he had in his yard a lively moose calf now about six months old, which had already become quite tame. The country north and east of the Muskoka lakes abounds in moose, as the immediate territory does in Virginia deer.

Is it not possible for some of our natural history and zoological societies and wealthy lovers of such game, who find a more lasting enjoyment than that gained by looking at it over a rifle barrel, to take steps looking to the permanent preservation in parks of these magnificent animals? Are they too destined to follow the buffalo into oblivion?

Going in to Crane Lake we found that a couple of gentlemen (Mr. Colin Campbell, of New York, and a friend) just the week before had killed a large black bear near the landing, and that another had just been caught alive in a log trap. As for the Muskoka country, if I were a hunter as I am a fisherman, I would never lay down my arms while the open season lasted, never, never, never. JAY BEBE.

TOLEDO, O., Oct. 3, 1885.

BOB WHITE—QUAIL—PARTRIDGE.

Editor Forest and Stream:

"Coahoma" thinks I have ingloriously retreated from the question of Bob White or quail and left him to bear the burden of the controversy. Let me assure him that I did not fear the encounter. When convinced that I am right, I quail before no man. My reason for not noting the remarks of one correspondent was that his style showed that no "glory" could be had from any contest with him.

In the South Bob White has been called partridge for more than a half of a century. At the North he was named quail. There are realy no partridges or quail east of the Mississippi or Rocky Mountains. The partridge of Europe more nearly resembles Bob White than he does the ruffed grouse, and yet the New England people persist in speaking of the ruffed grouse as the partridge. The quail of Europe does not resemble Bob White in several marked particulars, still the same people have dubbed our bird quail. If we will use Bob White as the name the error will be avoided. There is no authority anywhere, except the lowest of usage for giving our bird the name of quail. The error ought to be corrected. I have very little respect for any Southern men who has departed from the practice of his youth and adopted a greater error than the one which he contracted from his fathers. No man who speaks of the ruffed grouse (called in our mountains pheasant) as a partridge should complain of us for applying the same to Bob White, who far better deserves it because of the greater similarity to the European bird.

No habit which is preposterous can be properly canonized simply because some people persist in following it. Bob White is not a quail, and all the scribblers on earth cannot make him one. I do not mean to adopt the name, and I am equally opposed to calling the ruffed grouse either partridge or pheasant.

It is common with us now, but still highly improper, for persons to speak of "running" a farm, a law office, a blacksmith shop or a whisky saloon. Such word is legitimately applied to machinery. It may be tolerated, when used in connection with the business last named; for when the products flow freely there is a "running" into debt, disgrace and rags. WELLS.

ROCKINGHAM, North Carolina.

Editor Forest and Stream:

Your various correspondents who have been conducting the great Bob White-Quail-Partridge controversy are all wrong. If the bird (or birds) are to be named according to common usage, the word is patridge, giving the a the sound of a in hat. ORIOLE.

NORTH CAROLINA BEAR HUNTING.

OUR prospects for sport is brighter than usual this fall. The crop of partridges, or quail, promises to be good. Squirrel are rather more numerous than for some time past, and the influx or overflow of bears is something startling to farmers who have stock ranging the reed lands of the Dismal Swamp. The old settlers up at the head of the river declare they have never known them to be so numerous. The chief attraction seems to be a blackberry somewhat resembling the "gall berry," but sweeter, which seems to be thicker this fall than usual, though bruin does not confine himself to a diet of berries, but changes to beef and pork about three times a week. A party of young men went in a few days since with the dogs and found the bears so thick the dogs failed to run one out to the standers. They found the carcasses of four fine cattle that had been killed and partially devoured.

On last Monday morning I drove up the river and joined the boys in a big bear hunt, and got in just as they had finished the first chase by letting the bear cross the drive (a narrow path cut through the dense swamp) over into the big swamp, where he was as safe as a flea in a sheepskin. We immediately went into another drive, where the dogs struck the "hot foot" instantly, and after a three hours' race the meat again got away. On going into the swamp we saw where seven bears had entered the drive at different points, the tracks being fresh and having been made during the morning, as a rain had fallen during the night and the tracks were perfectly plain. After having lost our second bear we took the dogs, although they were nearly tired out, into a new drive and soon had the third bear coming directly toward us, the dogs in full cry and at times stopping to bay as the game showed fight. Our guns are now at full cock and we stand with finger on trigger intently peering into the dense mass of brush and briers forming the undergrowth; soon we hear the crash and rush of dogs and bear as they come straight for us.

We are now standing about twenty feet apart and each one imagines himself to be the "lucky fellow," when there is a sudden stop, then a roar, as the bear stops. On getting the scent the hounds rush at him opened-mouthed, and with deep-toned baying make the old swamp resound. Pretty soon there is a scream as one little fellow, "half bull, half hound," more brave than discreet, rushes in and pinches bruin, and receives a "tender caress" from his heavy paw which tears a triangular hole in the "seat of the pants" of the brave little dog, but this only enrages the pack the more, and they crowd down on the bear *en masse*, and he takes "leg bail" for other quarters, making for the big swamp, but we head him off, and as he attempts to cross the drivers' path a ball and nine buckshot cut short his career, and a fine "old he" lies stretched before us, killed by the very man of the party who was looked upon as being the least likely to kill anything. Thus I missed the chance of killing the bear, though standing within twenty feet of the young man who shot him, but so dense was the woods and undergrowth it was impossible for me to see anything for any distance over six or eight feet. In fact, the bear was not more than two lengths of his gun from the man who shot him. It seems almost incredible that a party of men well armed and with good dogs will allow the bear to get away time after time, but any one who has ever hunted in this desert, as it is called, will understand at once how easy it is for the bear to get away, and how hard it is to kill one.

We went hunting again the next day and ran out three bears and one deer, and then came home empty-handed, though we learned afterward that Monroe (my favorite hound, who would not run a bear) brought the deer out to the settlement, and both dog and deer were mixed up promiscuously in a gentleman's barnyard, both being too much worried to jump the fence. Whether the deer was caught or not we did not learn.

We are now arranging for a grand hunt next week, and if we carry out the programme I will let your hear from me. I will at my earliest convenience give you an account of a four-days' deer hunt over at East Lake during the first part of September, which I enjoyed in company with Capt. M. E. Gregg, of Washington, D. C.; Ben Thach, of this county, and Bill Basnight, the noted bear hunter of East Lake. We had a good time and enjoyed the trip greatly.— A. F. R.

BELVIDERE, N. C.

GAME IN NEW BRUNSWICK.

REPORTS of game from all parts of the Province are favorable. The warm and dry season has assisted the breeding of the birds, and here in Moncton boys may daily be seen carrying bundles of from six to a dozen ruffed grouse. A Frenchman coming in from the country to-day shot fifteen along the road without going out of his way. There has not yet been enough wet weather to develop snipe shooting, but the prospects are considered good. Last week a caribou came out on the northern division of the Intercolonial Railway and ran ahead of the train for some distance before taking to the woods. He had fine antlers, and his beauty aroused considerable enthusiasm among the passengers. Geese have not begun flying south yet, but black ducks have appeared in numbers. Gilmore Brown, C.E., discovered a new woodcock ground on Friday while surveying for the Short Line Railway, north of Salisbury. Wetmore, one of his party, succeeded in bagging a dozen, although he had no dog. B.

MONCTON, N. B., Sept. 29.

RIDGE-HUNTING DEER.

Editor Forest and Stream:

I read with much interest all articles in FOREST AND STREAM on the subject of hunting deer with hound dogs. I propose to go to the county of Highland and Augusta, Va., about the 19th of the present month to hunt deer. Now I have hunted over the same ground for the last twenty years; ever since our late "unpleasantness," and I find no scarcity of the cute animals within that period of time. We always hunt them with dogs and hound dogs that will run a deer quick and sharp. We do not, however, run them to the water, and our dogs will not run over half an hour nor will these dogs "carry" a deer out of the country. We run what is known to all hunters as ridge dogs and we shoot at the deer on watches where there are crossings on runways. I have often stood the entire day on a "watch" and heard the dogs without having a shot. I have again had deer run to me, almost over me, and never heard the dogs. I have again had deer run to me and stop and listen for the music of the hounds when I have not before heard a sound of the dogs.

I would rather hear the music of the hounds in full cry than shoot all the deer in the woods. It is not the meat we go for, it is the excitement consequent on the chase. Possession palls the senses, and after the chase we are as harmless as doves. With us the chasing of deer with trained hounds does not drive them away from their haunts. In our hunting region I can start the same deer every day in the week and within half a mile of the same place. He or she will always go back to his or her habitat—dogs can't drive them away from it. It is the long-winded chase, driving to the water, that is objectionable and drives deer away from their haunts. Ridge-hunting and the killing deer on runways before the hounds does no harm. It is like shooting hares in a warren. RIDGE.

BALTIMORE, Md., Oct. 2.

SOUTHERN CALIFORNIA.

OUR game season promises to open magnificently. Quail have not been so plentiful for several years, and the country is fairly overrun with them. My home is about a half mile distant from our court house (which is in the center of town), and only about one hundred yards from the Florence Hotel, one of our leading hotels, and yet there is a covey of birds numbering over a hundred located within gun shot of the house. I have not disturbed them, but intend to have some royal sport when the season opens. I regret to say that many hundred quail have been killed so far this year, but we in Southern California hardly feel inclined to protect them. The immense amount of cactus which infests every cañon, afford a secure sanctuary for our beautiful pest, and if all the market hunters in our section of the country killed 10,000 apiece a year I hardly think it would be noticed. Year before last one party of three shipped to market 3,700 dozen birds; besides this numerous other parties hunted them, and it is safe to say that in this county in the winter of 1883-4 there were killed and shipped in the vicinity of 80,000 quail; yet this season they are more numerous than ever.

Our viniculturists and small fruit farm men look upon them as the worst pests they have, and Eastern sportsmen at their first coming here gaze in horror upon the farmer who curses the bird that destroys for him annually hundreds of tons of grapes. But when the said sportsman has located here himself he experiences some of the benefits of protecting our beautiful crested valley quail, in my eyes the most beautiful game bird of America.

Several immense bands of ducks numbering in the thousands have passed over going south, and a number of pintails (or "sprigs" as the boys commonly call them) have been killed in the near vicinity to town. Black brant (*Bernicla nigricans*) have made their appearance on the bay—something almost phenomenal for this time of the year, and every indication goes to show that the cold weather has set in remarkably early up north, and that our water fowl are going to be plentier than ever this winter. The copious rains of the winter of 1883-4 filled all our ponds to overflowing, and last winter our duck hunting was superb, and promises to be equally fine this winter.

Deer are very plentiful this season. One farmer living within ten miles of town, has since the first of July last killed twenty-nine. Walter Morgan and M. Chick, left town this morning at 6 o'clock in a buckboard, drove about five miles and got back to town as the 12 o'clock whistles were blowing, and brought in two fine deer. Although I am not a deer hunter I have been strongly tempted to shoulder my rifle and "try them one," but I'm not much of a walker and a deer is, so I am content to wait until I get a shot at one on the sly.

If any reader of FOREST AND STREAM proposes to come out this way this winter, we will treat him well, and I can assure him that finer duck hunting cannot be had in America. We are always pleased to meet our Eastern friends, and will give them one and all a first-rate chance to "wipe our eyes," if they will only come. AD. E. PEARSON.

SAN DIEGO, Cal., Sept 13.

THE ST. LOUIS CONVENTION was very fully reported by the local press, especially by the *Missouri Republican* and the *Globe-Democrat.*

A HARTFORD PROPOSITION.—Hartford, Conn., Sept. 26.—*Editor Forest and Stream:* The time has once more arrived, in one life at least, to lay aside the type writer and the ups and downs of shorthand and to hie away for a vacation; and now we can laugh at the boys who take their vacations in July and August, and boil down in the sun. So we spend a day or two loading shells and getting out tent, blankets, fish-pole and lines, gun and provisions, and hie for a week in the woods; and then, dropping half our luggage, pick up our dog for two more weeks among the birds. I have found nine coveys of quail and a number of woodcock within two miles of my house and three and a half from the heart of the city, and I blush for Hartford sportsmen when I report that I know of over twenty birds that have been shot since the 8th of this month up to the 24th; and if any sportsman here wants to know their names I will send them with proof and will stand my share of the expense of punishing any offenders, if a protective society is started here, so that we may not lose all our birds by early shooting. By the way, one of those offenders is a member of a gun club, and he has told a friend of mine that he shot five partridge (ruffed grouse) one day last week.—CAL. .45.

VERMONT.—Ferrisburg, Sept. 20.—This is a perfect day, a blue sky and a gentle north air, neither hot nor cold. The trees are getting gay, though we have had no frost yet just here; but yesterday the Green Mountains and the Adirondacks were white with snow. In my few rambles in the woods since Sept. 1, I find ruffed grouse very scarce and very wild, and have no reports of their being plenty hereabouts. One came flying over my head this A. M. as silently as an owl and lit in a tree near by. He had been flushed by my hound. When I started him out of the tree he went with a "w-r-r-r-r-r-r-h!" It is good to be in the woods on such a day.—AWAHSOOSE.

BEAR IN MONROE COUNTY, PA.—A bear has for some time past been committing depredations in the neighborhood of Stauffer's Mills, Monroe county, Pa. Seven cattle and nearly a score of sheep have fallen victims to his hunger, and the farmers sought for him in vain. During the past week, however, he was tracked to his lair and killed. The bear when dressed weighed 160 pounds. Owing to the great amount of damage perpetrated it is almost sure there is a mate to this bear still in the neighborhood, and the hunt for the female will be continued.—HOMO.

LIVINGSTON COUNTY, N. Y.—"O. G. L." wishes to know of game in Livingston county. For grouse Ossian is the best town in the county. The country is similar to Northern Pennsylvania, being very hilly, with numerous ravines. Dansville is the nearest railroad station, five miles distant. There is no squirrel shooting in the county that we can hear of. This scarcity is general throughout Western New York. In a three hours' tramp only two were bagged by your correspondent.—W. Y. P. (Tuscarora, N. Y., Sept. 28).

SALEM, Mass., Oct. 2.—Have just returned from a week's shooting on the marshes at Ipswich. Found the birds rather scarce, though we got a sprinkling of jack curlew, beetle-heads, chicken birds, grass birds, sanderling and red-backed sandpipers, of which sport twelve birds fell to a 16-bore Parker in the hands of my wife. We got some teal (green wing) and one gray duck (gadwall). Coots numerous in Squaw Bay. I think after this easterly spell of weather the sport ought to be good.—X. Y. Z.

NORTH FERRISBURGH, Vermont, Oct. 3.—Grouse are more plenty with us than they have been for several years. Ducks are not very plenty as yet, but we are expecting a visit from them on their way South as there is quite good feed here this fall. Gray squirrels are very scarce for there were but few nuts last fall and they did not winter well. Although many young foxes were killed in early summer there seems to be quite a number left, and we are looking forward to fine sport with them.—NIMROD.

WILD RICE.—We have reports from Cincinnati, O., that the wild rice seed put out by the Mercer County Shooting and Fishing Club at St. Mary's Reservoir, has grown well. From Cobourg, Ont., comes a like report of successful rice planting in a pond, in which the water ranged from two feet to six feet in depth. In both places the crop of the year was very full.

WILD GEESE.—Shelton, Neb., Sept. 25.—A few flocks of geese, the first of the season, came from the north to-day.—A. W. S.

Camp Fire Flickerings.

"That reminds me."

170.

APROPOS of Flickerings, I am tempted to relate a little story myself, as told me by Dr. B., an old Kentuckian. When he was a very small boy his name was Joe, and he had a brother, Herman, slightly older than himself. In the orchard was a cherry tree, where many woodpeckers resorted for food. Joe and Herman improvised a pistol by taking a couple of joints of cane, using one joint for the handle and the other, with a small perforation for a "touch hole," as the barrel. Having carefully loaded it with a large charge of powder and shot they repaired to the orchard to shoot woodpeckers. Arriving at the cherry tree it was arranged that Herman should hold the weapon and do the aiming, while Joe applied a "chunk of fire" to the "touch hole." The cherry tree had a large representation of the red-headed tribe of woodpeckers fluttering around it, and Herman, with much care and painstaking, pointed his weapon where the birds were thickest, while Joe diligently applied the fire. But the cane pistol failed to respond; so Joe, in the warmth of his zeal, stuck his mouth down close to the "chunk" and proceeded to blow. There was suddenly a mighty explosion. The cane was shattered to pieces, and Joe's face was blackened and his sight suddenly darkened, even as the darkness of Egypt, for verily he was sorely burned by the powder; and Joe being a small boy, and taken completely by surprise, that part of the performance not being in the programme at all, without any unnecessary delay lifted up his voice and wept audibly. Herman was much frightened at the result of the experiment, and was

especially afraid that Joe's lamentations would excite inquiry, which would shortly lead to an interview with his father in which a "hickory" would perform a prominent part; so there was every incentive for Herman to soothe Joe's lacerated feelings and endeavor to hush his cries of anguish. There was a running "branch" not far off, and Herman was lugging Joe along to the branch in order to obliterate as far as possible the traces of his disaster. Joe, in much tribulation and sorrow, with his eyes fast closed, was weeping and sobbing vigorously, as is the wont of small boys under such misadventures, Herman all the while using his best endeavors to quiet him. Suddenly between his deep-drawn and distressful sobs Joe jerked out, "Herman, did you kill ary peckerwood?" And so ends my story.

Sea and River Fishing.

Address all communications to the Forest and Stream Publishing Co.

THE COMING TOURNAMENT.

As stated in our last issue, the Committee of Arrangements postponed the date of meeting to Wednesday, Oct. 21, for reasons given. Several more prizes have come in, and it is expected to have the score-book ready for distribution at an early day. The prize committee will probably arrange the list next week and we will publish it in full. The condensation of the classes so that the tournament can be finished in one day seems to be a good feature and meets with approval. Under the new arrangement there will be but one class for amateurs in single-handed fly-casting, and but one for the experts, instead of three for the former and two for the latter, as in previous years.

The changes in the rules, as published last week, is the result of experience in former years; but whether they are yet perfect remains to be seen. The rule of last year in casting for accuracy was that the contestant should have twenty-five casts at a float and should score one for each time it was touched. This seemed perfection at the time, but it was found that the general accuracy of some who seldom struck the float was much better than that of others whose flies touched it more frequently, and this test has been abandoned and the matter of accuracy left entirely with the judges. In minnow casting for black bass the rules now allow casting overhand as well as underhand, and as many use the rod in this manner it seems to be a good change. As this contest will probably take place on land, the committee did not think favorably of the proposition to use a wooden minnow.

In heavy bass casting the abolition of the lane will show some increased distances, and is an experiment worth trying. Those who remember the tremendous cast of Mr. Chas. Murray, two years ago, when his line went over the top of the willow tree in such a manner that the distance could not be recorded, will not be surprised to see all former records beaten. This class comes next to the single-handed fly-casting in popular interest and leads the salmon class; in fact the latter class never seems to bring forth much enthusiasm, while the interest in the minnow casting for black bass is quite feeble, owing to the fact that it is a style not in use in the East, where most of the contestants fish. The indications are that the tournament will call out a goodly number of contestants, and will equal in interest any former one.

LIVE EELS FOR STRIPED BASS BAIT.

Editor Forest and Stream:

I wish to call the attention of those who fish for striped bass to my experience with the live eel as the most convenient and alluring of all baits. I think if my brother fishermen will give the eel a trial where there are bass they will receive most generous returns. While not claiming to be the first to use live eels, I have yet to see any account when or where they have been so used successfully.

Sand worms proved to be an attractive bait, but they were very perishable, and thinking that live eels might prove a greater attraction, I obtained some small ones, say from six to nine inches long, and used them for small bass. I kept the eels in a car or box suitably made for the purpose. I afterward obtained larger eels, say ten to eighteen inches long, by means of setting regular eel pots. These eels were used for larger bass, and were also kept in properly made cars. Most of my bass fishing was done from a boat, taking the car or cars into the boat when on the move, and putting them into the water when anchored, or when laid up for the night. Eels may be kept in this way for weeks, and perhaps months, without food. I kept some of the small ones over a month without one of them dying.

The following are some of the results of using the smaller live eels, 6 to 9in. long, on the 6th of August, this year: I took six bass, weighing 2, 2, 3, 4, 4, 5 pounds. On the day after I took nine bass, of 3, 4, 4, 4, 4, 4, 7, 10, 16 pounds weight; on another day four bass of 3, 4, 4, 5 pounds weight; on another, three bass of 3, 11, 15 pounds weight; on another, three bass of 4, 5, 9 pounds weight; on another, five bass of 7, 7, 10, 11,16 pounds weight. There then appeared indications of the arrival of larger bass, and I then used larger eels for bait, and the other fishermen, seeing my success, also used the live eel.

The first large bass was caught on the 7th of September by a brother fisherman and weighed 51½ pounds, and in a day or two another bass was taken weighing 53 pounds, and the next day a 40-pounder was taken. I gaffed the above three fish for my friends. On the 13th of September I caught a 48-pounder, a friend gaffing him, and on the 15th I caught a 40-pounder in a two mile an-hour tide run on a very light rod and reel with a nine-thread line and a 6-0 hook, and after the fish had taken some 500 feet of line I reeled him in against the tide and gaffed him myself and took him into the boat. A day or two after another friend took a 55-pounder and on the 30th I took a 30-pounder.

In looking over my record of bass I find I have caught since th 5th of August over fifty bass with the live eel, averaging over eight pounds each; during the season up to the 1st of October I have taken eighty-three striped bass, averaging nearly eight pounds each, and I credit most of my success, together with that of my companion, to the use of the live eel as a bait. In using the eel I hook it upward through both jaws a little in front of the eyes, and in most, but not in all, of my fishing with the eel I trolled it out from the boat in the tide run which was strong enough to prevent the eel from swimming to the bottom or tying itself into a knot. I use a dry towel or cloth in handling or hooking on the eel, this prevents unnecessary squeezing or hurting it, for the livelier they are the more alluring they must, of course, be. I caught a number of bass by casting out the eel and slowly reeling it in, and even when there is no current either in casting from the boat or shore the live eel will be found to give the best returns of any bait now known.

To give an illustration from the fishing of one of the most expert soft crab fisherman I know of; I induced him to try a live eel some sixteen inches long, and he soon caught an eighteen-pounder, and up to that time this year he had caught nothing larger than seven pounds, and all my friends who have made the trial, emphatically assert that the live eel is the bait. Live eels enough for the day's use can be taken in a pale or basket and kept alive for the day if properly protected from the sun.

MEGALOPS.

NEW YORK, Oct. 1, 1885.

THE RANGELEY TROUT SUPPLY.

It cannot be denied that appearances superficially show a decided decline in the volume of trout in the last decade. I say superficially because no one has made a general estimate of the catch from one year to another, and the most of men who think they see trout growing less from year to year have no good chance to make comparisons except by their own catches, and those are subject to so many influences of chance that no true estimate can be so formed from any one man's experience.

Hotel keepers near the fishing grounds have of course the best chance to know the facts, but if they discover a decrease in the catch it is not for their interest to publish it. Some years are more favorable than others for securing trout, and also more favorable for the trout. Very much depends on the state of the water and the rainfall through the whole open season, and as much perhaps on the atmosphere. A long siege of hot, dry, calm weather in the fall fishing season will keep back the fish from their feeding haunts, and if some work on to the favorite places where they are expected and fished for, they will not rise in such weather.

We must not lose sight of the fact that there are hundreds more fishermen who visit our lakes now than ten years ago; and this would seem to diminish the average as well as the individual catch, for very few new places are found where fish congregate from year to year, and the guides take all parties to the same old places, as a rule. And who cannot see that the general catch is divided into smaller strings? More than this, the dams at the outlets of each lake have been built higher within a few years, which flows the water back further into the woods, making new feeding places for trout and shelter or retreat for thousands of small and large fish, and that, too, where it is not convenient for anglers to follow them; and who shall say that there are not new places where trout congregate—good fishing grounds somewhere in these new pools, formed by the higher flood of the lakes, that have not yet been discovered. It is evident to us all that the extra rise of the lakes gives a greater chance for the small fry to feed in security and grow unmolested; and we have good reason to conclude that the lakes are now being replenished, quietly and unobserved, in a manner that in a few years shall exceed our most sanguine hopes and astonish the frequent visitors to our lakes.

It is not only my opinion, but that of the Fish Commissioners and others who have good opportunities to judge, that large trout have materially diminished of late years, so that comparatively few of the largest sizes are now taken. One reason for this is that anglers have found the most of the places where they congregate preparatory to going on to their spawning beds, and diligently and persistently fish for them day after day, rain or shine, and take every fish that will rise, and so lessen the school of big ones. I am now referring to the largest brook trout which run together in masses, all of nearly the same size, or at least of two pounds weight and upward. One-pound trout, as a rule, spawn in entirely different localities and by themselves, and commonly earlier in the season by some weeks. This is not, however, exclusively so, for many one-pound trout are often mixed with larger ones on their spawning grounds.

It is thought by many good judges that there are more trout taken in the spring of the year now than formerly, and that there are as many or more trout in number in the lakes now than in previous years, but that they are less in size. This is probably true.

I am indebted to Hon. Henry O. Stanley, of Dixfield, Me.—one of our Fish and Game Commissioners—for figures as well as important facts in regard to artificial distribution of trout and salmon in the Rangeleys for the past ten years. Mr. Stanley says he has lost his minutes of the number of trout fry distributed, but judges that between two and three millions have been put into the Rangeley water since 1875, and of land-locked salmon up to 1881 fifty thousand in all, and two hundred thousand since. He thinks we are now having the benefit of the fifty thousand first put in only and says: "More salmon have been taken this season than ever before." Now, if it be a fact that we get no benefit from the planting of trout fry under six years, we may soon expect an abundant harvest, for the most of these two or three millions have been distributed since 1880. This we think encouraging. Mr. Stanley further says "small fry are abundant in all the brooks and streams of the upper lakes." The dams across the outlets of the several lakes have gradually changed the feeding and spawning grounds of all the fishes in these lakes, and they are still very unsettled in their migratory habits, so that there are doubtless many more trout in the aggregate in these waters than is generally supposed or than can be estimated.

There always have been and are now, individual cases where anglers have had no success fishing for trout in their visits to these lakes, and sometimes their catch has been so much less than anticipated that they have called it a failure. I have often known one party to take a big string on a certain day, and the next day another party to have no luck. Fishing is uncertain, as we all know who have spent the best of our days at it. There are so many influences, *pro* or *con*, which alter the conditions necessary to success, as—

The height of the water.
The condition of the weather.
The whereabouts of the fish.
The appetite of the game when found.
The manner of fishing or the cunning of the angler.

I sometimes read—even in FOREST AND STREAM—the experience of a party who has visited our lakes and had poor success, and who avers that the trouting has played out. I always think of these men—if they had been here at such a time, and seen such a party's catch, they would have formed a different opinion. Had they taken that eight or ten-pounder that such a one caught the week before, they would have written more hopefully.

On the Kennebago River on the 14th day of October, 1884, the Fish Commissioners of Maine turned out between 400 and 500 trout of all sizes from eight pounds and less. These trout had been captured to secure their spawn for artificial hatching, and no prettier sight could be imagined than these beauties sparkling in the sun with all the colors of the rainbow, their bright vermillion spots glistening with untold splendor, as they scampered away out of our weir to the waters of freedom.

These lakes are not to be depleted in a hurry of the famous ten-pounders that have made the Rangeleys famous. In all our observation and experience on and about these waters, we conclude:

First—That the largest sized trout have diminished in number.

Second—That smaller trout are more abundant now than in any time within the last ten years.

Third—That on the whole there is great encouragement. With the present yearly repletion our supply will continue to give pleasure to the thousands of anfilers who visit our wilderness and lakes.

J. G. R.

BETHEL, Me.

ANDROSCOGGIN WATERS.

THE trout season at the Androscoggin Lakes, in Maine, came to a more prosperous ending from the angler's point of view than the early September foretold. During the first of that month the fishing had the name of being very poor. Repairing the breach at the Upper Dam and the consequent stopping of all the water by a coffer dam at Trout Cove, utterly destroyed the fishing, both above and below the dam, on the grounds heretofore so celebrated for big trout and remarkable catches. This cut off a great slice of territory usually giving a chance for from ten to thirty sportsmen every day during September, and in consequence a large number of fishermen were like the trout themselves, demoralized, and did not know where to go. A few trout gathered in the pool below the pumping works at the foot of the dam, and there was some fishing at the mouth of the river, but it was not generally satisfactory. Some of the regular visitors to this celebrated trout ground at once "packed their kits" and turned for home when they saw the situation of affairs. Others fled to Parmacheene, Kennebago or the Seven Ponds. At any rate there have been very few fishermen at the Upper Dam the past September.

But those lovers of the sport who kept their courage up, as all successful sportsmen must, and sought other locations, have been awarded with fair September catches. One remarkable catch is recorded. Mr. John Prentice, of New York, took Sept. 28, off Brandy Point, Lake Mooselucmaguntic, a remarkable trout, *Salmo fontinalis*, which weighed 10½ pounds. It measured 27½ inches in length and was fully 8½ inches deep. Appleton & Litchfield's window in this city was ornamented with it a couple of days. It was a male fish, though the hook on the under jaw was less prominent than usual on large trout of that class just before the breeding season. The hook was much less prominent than on the celebrated Marble trout taken at the Upper Dam, Sept. 29, 1880, and now in the possession of the Smithsonian Institute. This specimen is said to have weighed 11 pounds, but your correspondent had the good fortune to see the fish before it was dead, and when it was first weighed. This was done with old steelyards, the best there were at hand, which were capable of weighing but 10 pounds on one side, and the other side was broken down and bent in the hooks. In order to weigh the fish a little pebble was required in addition to the steelyard weight to balance him. The fish caught by Mr. Prentice was far more symmetrical than the Marble fish, said to be the largest *Salmo fontinalis* on record. Its coloring was remarkably bright and perfect. Other large fish have also been taken this fall. In fact, the fall record shows larger fish this year than last, but not so the spring.

It is claimed that the Prentice fish was taken with a toodlebug fly, but it would require the unqualified statement of the successful capturer to make the writer believe it. It was also stated that the Marble fish rose to a fly. But those who saw the operations of Marble's guide in a boat directly over a spawning bed where the big trout had been seen for several days are obliged to doubt the fly part of the story. Such trout are down to the spawning beds each autumn, and the disgusted fisherman who casts his best flies over them for days without a rise is strongly tempted to jig them up—an operation as easy as wicked. It is much to be hoped that Mr. Prentice will state over his own signature in the FOREST AND STREAM, corroberated by his guide, just how his big trout was taken. Trout with all the force of reproduction upon them do not feed, much less come to the surface to our artificial fly.

It is pleasing to note how general is the dropping of fishing tackle at the Androscoggin waters when the close season begins on Oct. 1. This year the haunts were deserted promptly, although the weather was fine. But the law is respected in Maine by all true sportsmen. One of the camps on Richardson Lake, Camp Whitney, was closed by the firing of a salute as the little steam launch of the owner left the landing with his wife and family on board. They had been in camp five months. Trout have graced their table all summer long as often as desired. Indeed this should always be the case, and might be the case at the Androscoggin lakes were the abominable struggle for the boxful to take out as trophies abandoned, as many sensible fishermen have abandoned it. Trout enough for the camp table should satisfy any reasonable man. The idea of "a box of trout" to one's friends should be set aside with the term "speckled beauties" and other marks of the greenhorn. The writer was so fortunate as to be in camp nine days, catching twenty trout. The largest weighed four pounds and the smallest not less than one pound. The average must have been about two pounds. Here were at least forty poonds of trout for one camp. It was enough, though none were suffered to waste. Every fish was caught with a fly. Two were landed at one cast. With this record the writer is content to live and dream over his fly-rods till another year.

SPECIAL.

[This is, we believe, the third in size of the Eastern brook trout. There is a cast in the National Museum at Washington of a trout which weighed eleven and a half pounds. We think the fish came from Maine, but do not know who caught it. Then there is the trout that brought so much glory to our genial friend, George Shepard Page, which weighed ten pounds three weeks after capture, and which, it is claimed, must have weighed at least twelve when caught. This last fish was taken in the Rangeley Lakes of Maine, and its capture raised a controversy as to its species at the time which was settled by the highest authority in the land, Gill and Jordan, to be a brook trout.]

POTOMAC RECREATIONS.

IT is a source of gratulation when one has looked forward for months to a short vacation—rowing, fishing and rambling—to feel after the event that he has had a pleasant and successful time. One can stand a good deal of disappointment camping and tramping if he has now and then a red-letter day; but when his allotted time is all of a cardinal hue he considers himself one of Fortune's elect, and plays on his retrospective harp with solid satisfaction. But, after all, how much success depends upon careful observation and common sense. How essential it is to have something more than ordinary knowledge of localities, habits and food of game and fishes and methods of capture, and how important it is to keep an even temper under all circumstances and be patient as Izaak Walton himself.

After considerable inquiry and writing for information, I concluded a few weeks ago to spend ten days bass fishing at Point of Rocks, a station on the Baltimore & Ohio Railroad, near Harper's Ferry, within a few rods of the Potomac, where, it was learned, good fishing was to be had; where bass weighing from one to seven pounds graced the angler's basket, and where boats and bait were right at hand. So one Monday morning found me at the little burg, well equipped as far as tackle went, and determined to catch some of the aristocratic bass if the aforementioned patience and some consciousness of skill would avail. There were certain unfavorable conditions, such as very clear water, very bright and warm days and beautiful moonlight nights, when the fishes feed at night and do not bite as well in the daytime. The Potomac River is broad, you know, from Harper's Ferry down, shallow, but with deep holes here and there, full of great boulders, ripples, rapids, eel dams, sunken tree and beautiful islands, and it is pre-eminently a home for the noble bass, where he now is in vast numbers, and there to stay.

It was soon arranged that with a man to row and guide I should go up the canal two or three miles from the point, where the boat would have to be drawn over into the river, a hundred yards or so, and then leisurely return, trying all the favorable water that appeared on the way. We had for bait fifty minnows brought from Baltimore, called "dabblers," a long-lived, active little fish, but very dark, disposed to hide quickly in the grass at the bottom, and, as it proved, not an attractive bait for fall fishing. We toiled carefully the whole distance, casting, tossing, trolling, and didn't get a bite. Imagine my surprise when on my return to the hotel, to find that Mr. Jesse Claggett, a jolly sportsman from Frederick, and his attendant, had caught twenty-eight bass, most of them of good size, the string aggregating over thirty pounds. Here was food for reflection as well as for hungry anglers. I know I can catch bass under reasonably fair circumstances, know it by experience, and a good record. Consequently there was a cause thereabouts; what was it? I had good tackle, in fact was quite proud of it, though I hadn't a rod better than an all lancewood; I had gone over water where many bass, and some very large ones, had been captured recently, and I had been persistent Looking at Mr. C.'s string with admiration, I said: "What kind of bait did you use?"

Turning to me with a confidential air, he said: "Catfish. Dabblers and canal minnows are N. G. I am going back to Frederick with my catch and will return in the morning early to fish the water you were in to-day. Will bring you a couple dozen catfish if they are to be had."

This was generous and gentlemanly and done with the spirit of a true sportsman. The next morning I set out with a bucket of small catfish, which came as promised, took a boat by myself, rowed out to a rock in the middle of the river below an old eel dam, put out my stone anchor and went to work. Put two hooks, Conroy's Cincinnati, on a line attached to a medium-sized bass rod, not my favorite, bit off the sharp horns of the struggling bait and tossed to a desirable-looking dark place sixty feet away. Then I went to rigging the lancewood, and had got the reel placed, when there was a beautiful signal from the first. The handle of the reel went round and round gently at first, then with a whizz, and in a minute I landed a bass that weighed a pound and a half. He fought every inch to the landing net, and when he with six others reached Washington that evening, to which point I shipped them by express in the afternoon, he was alive and kicking. By 2 o'clock, after resting an hour for dinner at noon, I had nine very pretty bass, the string weighing twelve pounds. This was good fishing, and I felt comfortable and contemplative. Putting away the tackle and sinking my bucket of minnows (I had not used more than half), I went on an exploring expedition, shooting rapids, gliding over swift ripples, landing on an island and wandering along its flower-fringed shore, listening to Jim Baker's grammatical jaybirds and some noisy kildeers, noting favorably looking places by sunken trees, partly submerged, boulders of huge dimensions, chasing big suckers that were foraging on aquatic grasses in shallow water, and otherwise rounding out a beautiful day on the water.

Next day I went up the river a mile, anchored at a hole by an old treetop, tying the boat's stern to a protruding branch to keep it steady, and cast down stream as far as I could. There was no immediate response, and so I took out a briarwood pipe that had seen service in the distant Rockies, loaded it with "old Virginia," whose noble Mount Catoctin pictured my horizon on the west, and adjusted myself for a season of masterly inactivity. This is still-fishing, you understand, the stillness broken frequently by splashing on the periphery of your circle, the shaking head of an active and determined fish, the cut and swish of a taut line, and the dip of a landing net. I did not smoke long before one of the reels began to turn, and almost instantly I struck, having determined the day before never again to let a bass run with the line before striking, and lo! there was music in the circumambient air. It was hard work to check the rush down stream, and when I did there was instantly a perplexing and dangerous rush up stream, but which I stopped ere it was disastrous. From there was a steady, stubborn fight clear to the boat, when I noticed that two bass were on, churning the water, leaping like acrobats, and rousing two or ten-fold enthusiasm back of the reel. To land one good bass is a matter of glorious uncertainty to the last moment, but two, well, it's a little short of the sublime. It stirs your latent powers, arouses your judicial nature, stimulates executive talent, awakes every muscular function, and calls for special tact until the campaign is over and the ballots are counted. I had hard work to keep my school of fish out of the treetop and away from the anchor rope, but finally succeeded, thrust the landing net for general results, and got my beauties into the boat, both of them free of the hooks when they struck the planks. Both were caught in the mouth, and the unusual tussle had well nigh torn the hooks out before it was everlastingly too late. This was the only time I caught two bass at once, but it gives a rosier hue than usual to the already well-painted picture that memory has in good collection.

Each day out was largely a repetition of those described, varied by different water, different scenery and other conditions. At times a light breeze rippled the surface of the river, making casting difficult or easier, according to position, and serving to render the angler less conspicuous; again the current made the boat get into the wrong places with almost mulish persistence, the grass that grew on the rocks and waved in the current caught the hooks, and several times caused the fish that were on to break loose, and other accidents that test the true metal of the man, seemed bound to occur. This is the shading and filling in of the picture spoken of, the varying tints, the clouds and tangled places, that give character and rugged outline to the whole, and make it more enduring.

Fall bass fishing in the Potomac is excellent, whatever may be said by some, and it is a great source of comfort and recreation for the anglers of Baltimore, Washington, Frederick and other places. Almost anywhere from away up in the mountains down to Great Falls, at Harper's Ferry, Weverton, Point of Rocks, and stations within easy distance of the river on the B. & O. Railroad good sport may be had. At all these points boats and bait can be readily obtained, as well as attendants, who know the river well, and who will render good service for a fair consideration.

JEROME BURNETT.

THE LAST CAST.

MY wife says that just as soon as I get home from Moosehead I begin next day to pack for the next year's trip, which, I am proud to acknowledge, is mainly true. "The beloved Maine woods," as my professional and piscatorial brother, Dr. P., hath it, never seemed so lovely as this September. The Outlet was unusually deserted, when we arrived, since guests had come and gone, and left clear water for us. So for two days we whipped at the sluice and down at the long pool, and piled up the score.

The Moosehead trout do not average such large size as at Rangeley and their shape is different. They are relatively shorter and broader, but well marked in distinctive spots and usually hardy fighters. In the streams about the lake abundance of half and pound fish are taken, while at the Outlet they scale at two and a half to three pounds, and even an occasional four or five pounder is brought to net. What they lack in weight they make up in gaminess, are wary, and the angler has to earn his fish. Fly-fishing is commonly styled sport, but sometimes labor can be more truthfully substituted. Let those who have played a three-pound fellow in quick water, and personally netted him, testify.

But too soon came the inevitable crowd. Why is it that men who are teetotalers at home are sots in the woods? Alas, three or four men, not fisher-men, were at every pool, who whipped and whipped and whipped. Every fly, from grave to gay, hackle, ibis, or Montreal, *et id hoc omne genus*, vexed the waters. In one respect certainly, barring the time, they resembled the disciples, for they toiled all day and caught nothing. Disappointed and disgusted, my friend, a veteran fly-fisher in Maine waters for forty years, and myself waited only for the rising of Monday's sun to pack our duffle and get away from the annoyance.

The morn announced itself by the rattle of rain upon the window. As it was our last opportunity of the year for trout, it was decided to try the stream just once more. So doughnuts are munched while we don rubber coats and boots, and with rod and net each slips into his canoe. "Ed, why didn't you bring your rubber?" "Wal, we shan't be gone long, and I guess this aint goin' to amount to much." A new leader, with a Seth Green for tail fly and an Abbey for dropper, is well bent on when we get out from the bank into quick water. A steady pour of rain isn't a really pleasant welcome at 5 in the morning when the bed is never so inviting and the air never so chill. Steadily the rods rise and the flies drop, now under the edge of that stone and then in the tail race just below another. But no rise. Pool after pool is systematically worked, but to no avail. "Let's try the head of the long pool." Ed poises the canoe for its plunge down white water. The iron of the setting pole rings out clear, and in a breath the foam-crested rapids are above us and we are in the edge of the main current by the old stump.

Now a cast at my left, and I strike a two-pounder. He pulls and tugs away, but in fifteen minutes or so the net lands him in the boat and the Seth Green scores another to its credit. Pretty soon I strike another, when, after playing him a little, my attention goes to the canoe of my friend, which has just come up beside us. "How many?" "Two," I shout, "one in the canoe and this one." But while talking I drop the tip of the rod, which maneuver permits the fish to get a straight pull upon the reel. This stupidity ends, as it ought, in my flies coming back to me and "this one" tearing out. It is a capital demonstration of the mechanism of a fly-rod. Its perfect elasticity keeps an even tension on the line, ruthlessly tiring out the trout as he hugs the gravel, fruitlessly gnashing his teeth against the vapid fly. More than this, it keeps the hook constantly pulling on the tissues through which it has been drawn, and, provided steel and flesh fail not, is a safeguard against unhooking by a sudden rush toward the rod.

Now comes the rain again, and for a time there is no rise. We drop a little lower down, and Ed, behind me, groans, "Guess I shell hev to change my shirt when I git home, sure." But the wet lessens. I look at my watch and find it ten minutes of 6. Just previously I have made a long cast, seventy feet or more, and then reeled off thirty feet besides, by which the flies are carried down in the swift current nearly to the broken edge of the pool. At the moment I drop the watch into my pocket, instinctively I strike and hook my third fish. In the first rush toward me he shows himself to be a "big one." No fooling this time. I reel as fast as possible half the line, and there he sticks. The hurry is over, and I sit back and take account of stock. The birch is against the tip of a submerged rock, kept broadside to the current by the setting pole of the guide, and ten feet of water is under us. The implements of warfare are a home-made lancewood rod 10½ feet long and 8 ounces in weight, a new oiled-silk line, a salmon leader and new large flies. I guess I can fetch him, and steadily give the butt. The fish moves a little toward me, and then whir goes a hundred feet of line. I retrieve some of it and try the butt again. It is no go; he at least is in no hurry to get in out of the wet. Another dash, and this time for the surface, but I balk him by rolling the tip under and giving a few yards of line. Meantime the rain echoes the line of the song, "But I go on forever." My arm begins to cry out under the constant strain, and I shift the rod into the other hand. My friend in the adjoining canoe stops casting to watch the fray, and my heart beats are climbing upward toward fever limits. What pleasure is there in comparison to the matching of skill against strength? I can recall many exciting times in professional life—my first baby and my first amputation—but what are these to the solid rapture of the present? But soberer thoughts intrude. Isn't this an instance of the fish playing the man? I can't get him near enough to net him, and I don't dare to reel in any more. Finally I turn to Ed, who, patient fellow, holds steadily on to his setting pole, his eyes sparkling with a fellow feeling, from his nose there trickles a gentle rill of rain, and his broad shoulders bend to the pour. "If you will put the canoe where it will hold itself, and then take the rod, I will net him." I turn my head back to my line and—"he's gone," we both cry out. Not through lack of skill in handling—a steady strain on the rod made the tip show a liking for the hand which grasped the butt—nor through breakage of hook or leader. All I can say is he tore out, and the largest fish of the season is gone.

Perhaps the United States' language wasn't aired for a time. The watch marked 6:57, sixty-seven minutes from strike to loss, and thus ended the longest and hardest struggle I ever had with a trout.

And this was really my last fish, for though I whipped the same pool thoroughly, nothing rewarded me, so finally, for the last time in '85, the canoe takes me back through rapids and pool and shadow up to the house. The gripsack is packed, rods are unjointed and covered, the steamer casts off for Greenville and the train at West Cove, while once and again do recollections of that brave fight press home. Oh, if I could only have weighed, or even seen him! Why did my hook fail me? When the snow whirls by my window next winter, and, tired of business, I sit in my big chair before the glowing fire, I shall take out that rod and live it all over again. The lancewood earned an honorable place for itself beside its aristocratic neighbor, the split bamboo, when down the river in the long pool and in the rain at that Monday morning it made "its last cast."

S. P. W.

PORTLAND, ME.

PINE TREE CREEK.

Editor Forest and Stream:

There are many men in the city of Boston to-day who can remember the delightful times they have had fishing for trout in Pine Tree Brook, Milton, in the old days when trout were plenty and sizable. I have an old uncle who tells of a two-pounder caught there by himself. Although the primeval pines which formerly guarded this brook are gone, yet a crop of birches have grown up to take their place, and with the exception that the water is a trifle lower than of yore, the same conditions exist as in the days when the trout were plenty. Nevertheless it is a melanchololy fact that the trout are decreasing every year. Hitherto I have blamed the boys in the vicinity, who are perpetually "skinning" the brook. But recently I have learned that the shotgun fiend is also at work.

A few weeks ago, while hunting woodcock in the neighborhood of the brook, I heard three reports of a gun with short intervals between. Being curious to know who they were and what they were shooting at, I started in the direction of the sound, and soon encountered two boys, one of whom was carrying a gun. They informed me that they had been shooting at the trout in the brook. They said that they had not killed any. Thinking that this was an exceptional case and that they knew no better, I contented myself with giving them a piece of my mind with a little practical advice thrown in.

Last Saturday, happening to be near the pool where the trout spawn, I crept to the edge, and looking in I saw a beautiful sight. There were at least twenty trout swimming gracefully about, perhaps a dozen good-sized ones and one big fellow, nearly if not quite a foot long. After watching them for some time I caught a cricket and tossed it in. Scarcely had it touched the water before a fine trout broke water and seized it. It wasn't long before I missed the little troutlings, the future hope of the brook. This pool had always been a great resort for them, but now not one was to be seen. Suddenly a green object at my feet with a brass end explained the mystery; it was an empty shell. Some one had been murdering trout with a shotgun. I suppose that the shock kills the little ones outright while it only stuns the larger ones, and they float down stream, a dainty meal for some mud turtle.

Is there no way this slaughter can be stopped? With a little care and protection Pine Tree Brook could be brought back to its old glory. It is fed by springs of ice cold water, some of which have never run dry. The bottom is part sandy and part muddy and there are plenty of nooks in the sides such as trout love. I wish our Fish Commissioners would see what can be done.

FEP.

SOUTH BOSTON, MASS.

THE KINGFISHERS.—Duluth, Minn., Sept. 28.—*Editor Forest and Stream:* The "Kingfishers'" camp has always been interesting to me, because "I've bin thar." I love camping, and have enjoyed some pleasant vacations on the rivers and lakes so aptly described by Hickory, and have had the pleasure of greeting Hickory and Uncle Dan'l. The grip of the old bass fighter almost started the blood from my finger nails. On the occasion named—the Black Lake trip—I met them. The trip was an entire failure; they did not get fish enough to supply camp with, so pulled out at once. While the "calamities" of our large camping party were being loaded into two wagons, I spent the few moments conversing with the "Kingfishers" as the "calamities" of their party were being loaded into a wagon, but not a rifle or gun did we see. It is a singular thing that this charge should be sprung on them, when for years they have been so highly spoken of by anglers who have been fortunate enough to meet them. For four seasons I have camped and fished within almost hailing distance of them, and until this time have never heard them spoken of in other than pleasant terms, and hoped they would come again. I hope the Carp Lake letters will be resumed; I have been waiting for them. And if the "Kingfishers" cannot fish in dear old Michigan without being stabbed in the rear, let them come up into Minnesota; a family of anglers can promise them fine sport, and a fight with as game a bass or tussle with a musky that will put Uncle Dan on his mettle, and that boy of mine is big enough to "wrassle" with him, and will row or paddle him from morn till evening without a grumble. We will find Hickory some brook trout bigger than fingerlings, and plenty of them too, while Misses Kit and Bob can try their skill against a twenty-pound lake.—W. DAVID TOMLIN.

BLACK BASS IN LAKE CHAMPLAIN.—Rouse's Point, Oct. 1.—*Editor Forest and Stream:* Many of your readers have visited the Windsor Hotel at this place this season and had sport with black bass. On Sept. 28 Charles Beck and L. Perry in one boat, T. Chabott and guide in another and Capt. Auchman and myself in a third boat, secured thirty-four black bass, two muscalonge and one pike between 2 and 5 P. M. The largest bass weighed 4½lbs.; the others averaged 3lbs. The next day we secured twenty-three black bass, the largest weighing 4½lbs., three others 4lbs. each. The bass of these waters are generally of good size. Rouse's Point is considered the best point on Lake Champlain for bass and is a favorite resort for many experts. We are told by the oldest inhabitants that they never saw so many bass taken in so short a time with rod and reel. Each day our catches were made in the afternoon after 2 o'clock. The entire weight of first day's catch was 101½lbs.; weight of second day's catch was 84lbs., including one pickerel and ten perch which were weighed with the second day's catch. —THOMAS SLINGSBY.

A TIM POND CATCH.—Boston, Sept. 30.—Apropos of extremely good luck while fishing, Mr. C. J. Connelly (proprietor of the Adams House news stand), his brother, John L. Connelly, of Brooklyn, Mr. F. H. Carpenter, of Providence, and Mr. Pendergast, of this city, had a remarkably good catch while recently fishing at Tim Pond, Maine. One of the features of the catch was the taking of three trout averaging 14½ inches in length at one cast by Mr. C. J. Connelly. One of the trout is the largest caught this season, and the three average the largest caught in seven years. As a trophy of the catch Mr. Connelly has a fine photograph which Mr. Carpenter took of the fish before detached from the flies. The flies on which the fish were taken were the brown hackle, professor and silver doctor.

WA-WA-YANDA CLUB.—In the County Clerk's office there was filed yesterday a certificate of incorporation of the Wa-Wa-Yanda Fishing Club. Its objects are fishing and hunting and the protection of game. The corporators are Victor E. Roumage, C. C. Roumage, Jr., James A. Flack, James J. Mooney, George Jaffrays, Richard B. Hunt, Richard V. Harnett, George W. Wingate, E. Henry Witthaus, Martin B. Brown, Edward Kearney, A. L. Ashman, Charles J. Tappan and Shepherd Knapp.

A MAMMOTH COD.—Portland, Me.—A cod weighing 110 pounds, length 5 feet 4 inches, length of head 15½ inches, was caught Sept. 29 on a trawl near Portland, and I have just partaken of a steak cut from it. The fish was of symmetrical form, and its flesh of excellent flavor, although somewhat dryer than that of a younger fish. It is the largest fish of the species (the common cod of this coast) I have ever examined. Can this record be beaten?—EVERETT SMITH.

NORRISTOWN, Pa., Oct. 1.—Mr. E. A. Leopold caught two black bass yesterday at Catfish Dam. To his line were attached two hooks, both baited with live minnows. Feeling a bite he struck, and after a few minutes' lively play had the satisfaction of landing two bass, the one on the upper hook being caught in the ordinary way, but the other was hooked on the under side just in front of the pectoral fins.

HARWOOD, Rice Lake, Canada, Sept. 30.—The fishing is first-class here, with plenty of maskinonge catching every day.—C. G.

Fishculture.

COMMISSIONERS OF FISHERIES.

IN our last issue we gave a complete list of the Commissioners of Fisheries of the different States and Territories, and under the head of Canada and the British Provinces we noted the fact that we could not learn that any appointment had been made to the office vacated by Mr. Whitcher two years ago. We now give below a corrected list of the officers of the Dominion, received direct from the Department of Fisheries:

DOMINION OF CANADA—
John Tilton, Deputy Minister of Fisheries, Ottawa, Ont.

PROVINCE OF NEW BRUNSWICK—
W. H. Venning, Inspector of Fisheries, St. John.

PROVINCE OF NOVA SCOTIA—
W. H. Rogers, Inspector, Amherst.

PROVINCE OF PRINCE EDWARD'S ISLAND—
J. H. Duvar, Inspector, Alberton.

PROVINCE OF BRITISH COLUMBIA—
Geo. Pittendrigh, Inspector, New Westminster.

PROVINCE OF MANITOBA AND NORTHWEST TERRITORIES—
Alex. McQueen, Inspector, Winnipeg, Man.
S. Wilmot, Superintendent of Fishculture, Newcastle, Ont.

THE AMERICAN FISHERIES SOCIETY.

THE RIVER EXCURSION.

ON Thursday, May 7, the Society made a trip to the shad hatching grounds of the Potomac on the U. S. Commission steamer Fish Hawk, by invitation of Prof. S. F. Baird. Col. Marshall McDonald acted as master of cermonies and was ably assisted in doing the honors by Lieut. Pietmeyer, Prof. Goode and Mr. Cox. Arriving at Fort Washington an attendant showed four million eggs in process of packing for shipment to the central station at Washington. At 3 P. M. the company sat down to a lunch of planked shad, corn bread and coffee, and then made ready to return. On the homeward trip a meeting of the Executive Committee was held in the cabin, Hon. Theodore Lyman presiding. Mr. Lyman suggested that the present was a proper time to transact any unfinished business and to make any necessary arrangements for the next meeting.

PROF. GOODE moved that a vote of thanks be tendered to Prof. Spencer F. Baird, Commissioner of Fisheries for the United States, for his courtesy in placing the Fish Hawk at the disposal of the Society for this trip. Carried.

MR. CLARK moved that the next annual meeting of the Society be held in Chicago. He said that it would be a great gain in membership to the Society to hold it there, for many Western men had held aloof from it thinking it to be an Eastern society entirely, and that little or no attention was paid to Western fisheries.

PROF. GOODE—The remarks of Mr. Clark carry great weight. It is desirable to meet in other places than New York and Washington, although the latter is common ground. I think it would be well to meet in Chicago next year.

DR. HUDSON—In 1876 we met in Philadelphia, but did not gain any members to speak of, yet if it is believed to be best to meet in Chicago we might try the experiment.

MR. MATHER—If it is necessary to meet at different points to avoid the charge of localism it may be well to do so. But why any person should consider that the society is in any sense a local one I fail to see. Its name covers the continent, and the subjects treated of are not at all restricted to any locality. It has been suggested, and I thought it understood, that the next meeting should be in New England, perhaps in Boston, and we certainly should meet there some time, if we propose to change about. New York and Boston are the great fish centers, and Washington, as Prof. Goode has said, is common ground. I do not think that any place is as good as Washington, but will agree to anything the majority thinks best.

MR. BUTLER—If we go West one year we will not lose members, but will gain them. The Commissioner of Agriculture hoped that we would go west of the Mississippi, and if so we would have a large meeting; but at Chicago we would certainly have a most interesting and profitable one.

MR. MAY—I hope that this question will be decided to-day and that it will be in favor of Chicago. We will then begin to urge Western fish commissioners and those interested in fishculture and in fishing to attend.

MR. CLARK moved that the next meeting be held in Chicago and that a local committee be appointed to fix the date and make all necessary arrangements. Carried.

The President appointed as such committee Messrs. F. N. Clark, W. L. May, Dr. R. O. Sweeney, A. P. Butler, Fred Mather and W. V. Cox. The meeting then adjourned.

The Kennel.

FIXTURES.

BENCH SHOWS.

Oct. 6, 7, 8 and 9.—Second Annual Dog Show of the Philadelphia Kennel Club, in conjunction with the Pennsylvania State Agricultural Society. E. Comfort, Secretary, Philadelphia, Pa.

Oct. 6, 7, 8 and 9.—Fourth Annual Dog Show of the Danbury Agricultural Society. S. E. Hawley, Secretary, Danbury, Conn.

Oct. 8 and 9.—Second Annual Dog Show of the Stafford Agricultural Society. R. S. Hicks, Secretary, Stafford Springs, Conn.

FIELD TRIALS.

Nov. 9.—Second Annual Field Trials of the Fisher's Island Club, for members only. Max Wenzel, Secretary, Hoboken, N. J.

Nov. 9.—First Annual Trials of the Western Field Trials Association, at Abilene, Kan. Entries close Oct. 15. A. A. Whipple, Secretary, Kansas City, Mo.

Nov. 12.—New Jersey Kennel and Field Trials Club. Field trials for members only at Fisher's Island. A. P. Vredenburgh, Secretary, Bergen Point, N. J.

Nov. 16, 1885.—Seventh Annual Field Trials of the Eastern Field Trials Club, High Point, N. C. Entries for All-Aged Stakes close Nov. 1. W. A. Coster, Secretary, Flatbush, L. I.

November.—Fourth Annual Trials of the Robins Island Club, Robins Island, L. I., for members only. Wm. H. Force, Secretary.

Dec. 7.—Seventh Annual Field Trials of the National Field Trials Club, Grand Junction, Tenn. Entries for Derby close April 1. B. M. Stephenson, La Grange, Tenn., Secretary.

A. K. R.—SPECIAL NOTICE.

THE AMERICAN KENNEL REGISTER, for the registration of pedigrees, etc. (with prize lists of all shows and trials), is published every month. Entries close on the 1st. Should be in early. Entry blanks sent on receipt of stamped and addressed envelope. Registration fee (50 cents) must accompany each entry. No entries inserted unless paid in advance. Yearly subscription $1.50. Address "American Kennel Register," P. O. Box 2832, New York. Number of entries already printed **2704.**

FANCIERS' FALLACIES.

BONE.

WHEN a man speaks of a dog having plenty of bone, or being light in bone, he generally refers to the long bones of the legs; in the latter case the bones being of smaller diameter than in the former, which also has more strongly-developed ridges for the attachment of the muscles. Now, though undoubtedly many fallacies exist as to the size of bone required, it is impossible to state what amount is needed in a class so diversified as that of dogs, and where we get such very different types of animals as the boarhound and toy terrier in one class; therefore, one must leave to the sound judgment of fanciers themselves, founded on common sense, what they should breed for. It is my purpose in this article to point out the uses of bone, especially as regards the long bones, and some of the difficulties incurred in arriving at a right conclusion.

In the first place, we have no original type to which we can refer the whole class, dogs probably deriving their origin from several different species interbreeding, and wild dogs being, without much doubt, descended from domesticated dogs which have deserted mankind and run loose, unless we include the wolf, jackal, and perhaps fox. Again, we have such hereditary monstrosities as the basset hounds to deal with. I fancy, perchance, I am attacking some fanciers' fallacies now. These facts will show how much depends on fanciers and specialist clubs drawing up a proper and fixed standard for their favorite breeds. Now, as to the uses of bone. Nature, with her unfathomed knowledge, has, as usual, shown her wisdom by making the long bones hollow, thus losing nothing in lateral strength, and at the same time making them as light as possible.

Those who are fond of mechanics should study the physiological structure of bone, than which nothing is more beautifully planned for giving the greatest amount of strength. It is reckoned that bone is just twice as strong as oak, and that one inch square of bone will support a weight of 5,000 pounds. I should state also, without going too much into detail, that bone is made up of one-third animal matter (gelatin) and two-thirds earthly ingredient (mostly phosphate of calcium), the latter giving strength and the former elasticity; the long bones are also more or less curved to give play to this elasticity. Bones form the framework for the moulding and support of the soft parts of the body, and should therefore vary according to the size of the animal; they also form the joints for the locomotion of the whole body, as well as for the movements of individual parts. Nature here again has stepped in and made the ends of bones larger and much lighter than the shaft so as to give broad surfaces for articulation and attachments of muscles, and lastly—I am referring to long bones only—act as levers for the muscles in such a way as to obtain the greatest mechanical advantage. Breeders should remember, then, in breeding for bone they may lose in weight and coarseness more than they gain in strength, destroying the dog's beauty and hampering him in his flight, and that nature has supplied an article in bone remarkable for its strength and lightness, with the greatest mechanical appliances to aid it. What better guide can we follow than nature?

SIR—In reply to "Corsincon," I believe he will find in a few text books the statement that there is a canal running down the whole length of a hair, but this is disproved by Weber, "who has shown that the appearance of a central canal, and of a softer internal than external material, has resulted from microscopical errors occasioned by the unequal refraction of light passing through their rounded or grooved surface.—*Hakim, in the Stock Keeper.*

THE KENNEL HOSPITAL.

THE skin diseases of the dog are usually supposed to be included in the single term mange, and the only qualification made, even by some good writers, is to describe sundry varieties of mange. Now this crude method of classification only perpetuates ignorance, and, under an appearance of simplicity, causes confusion. Skin diseases are capable of a clear division into two kinds—contagious and non-contagious. The first are due to the irritation caused by animal or vegetable parasites; the latter are due to constitutional causes or to the injuries caused by chemical or mechanical agents. Contagious skin diseases due to animal parasites we shall first consider, and commencing with the larger insects—fleas, lice and ticks—class them under the head verminous disease.

Fleas.—These insects cause great irritation to the dog, giving rise to violent scratching, which injures the skin and coat. In hot weather they are most active, but are common enough in winter. I am told by the owner of some "performing fleas" that they are very tenacious of life, living from eight to fifteen months when carefully treated. I do not believe that it is a special variety that infests the dog, and I am certain that they may exist for months without any connection with that animal. Kennels, stables, hay, mats, carpets, etc., may harbor fleas for many months when no dog has been near to afford them sustenance. Hence, a great difficulty in freeing dogs from the annoyances. We may destroy every flea in his coat one day and find him swarming with them a few days after, having collected them from the various substances upon which they remain alive and active, but which they immediately forsake for the happier hunting grounds offered by the dog. There are many effectual agents for the removal of fleas from the skin of the dog. Some are poisonous, and some are not. Some are used with water, others dry, and it is well to bear this in mind, as there are cases in which washing or even wetting the coat is very dangerous. In cases of acute illness, such as distemper and some chest affections, it is very desirable to get rid of the constant irritation caused by fleas, and it is equally desirable to avoid moisture. In such cases dry applications must be resorted to, and none is better than the Persian insect powder dusted, rubbed, or blown into the coat. Camphor is a harmless remedy which has been recommended, but it is not very effectual. Even a saturated solution in spirit only causes the fleas to fall insensible from the coat. It does not kill them, and they rapidly revive in the sunshine. Watery infusions of quassia, tobacco or stavescre are effectual, but the last-mentioned is poisonous, and tobacco very disagreeable. Quassia is unobjectionable, being non-poisonous, free from color and smell, while very effective. Two ounces of the chips to a gallon of water will form a good infusion if allowed to macerate all night. Into such a bath small dogs and cats may be dipped, and, if the weather be warm, allowed to dry themselves, thus retaining some of the medicament on the skin and coat to protect them for a time against further attacks. There are a number of medicated dog soaps now sold which profess to kill fleas. Failure frequently follows their use, owing to an insufficient lather being produced by the person using them. On the other hand, a copious lather produced by a carbolic soap may injure the dog if allowed to remain too long on the skin, or if not properly rinsed out with plenty of water. Spratts' is not a carbolic soap, and yet seems very effective against fleas. Of all carbolic soaps I prefer Calvert's, simply because they are of definite strength, and, therefore, one knows exactly what effects to expect. The various sheep-dips are destructive to fleas, and when properly made into a bath not dangerous, excepting those containing arsenic, which are to be avoided as dressings for any animal likely to lick itself. To thoroughly get rid of fleas, whatever baths or applications are used must be repeated, and places likely to harbor the insects should be cleansed; mats, kennels, straw, etc., should never be neglected. Pine sawdust or shavings are recommended instead of straw as a bed. Hay should be avoided altogether, as it affords a most favorable surrounding for vermin.

Lice.—The dog louse resembles in form the human head louse. It is not so active as the flea, and does not cause so much irritation. It multiplies rapidly, depositing eggs upon the hairs in the form of small white objects which adhere firmly, and are known as nits. These eggs are hatched in about eight days, and the young lice are in a few days able themselves to deposit fresh eggs. The dog louse is found on all parts of the skin, on the legs, body, and head, but a favorite spot is just behind and below the ears, where the nits are to be plainly seen on the hairs. In partially cured cases we may often find quantities of nits and only few living lice. No predisposition is necessary to cause lousiness in animals. It is true that weak debilitated dogs are often found to swarm with lice, but the debility had nothing to do with their advent, it only favored their development and increase. The dog louse does not multiply on the human being, and soon ceases to exist off the dog. The difficulty in getting rid of lice depends chiefly on the eggs attached to the hairs, which are not injured by the dressing that kills all the developed parasites. To effectually rid a dog of lice we must either make use of an application which can be left on the skin for nine days, so as to cover the whole period of latent life in the nits, or repeat our dressing at an interval which will prevent newly-hatched lice from reaching the age at which they are capable of depositing more eggs. Three dressings, with an interval of four days between each, will do this. A dressing of equal parts of paraffin and oil is safe and effectual, though nasty. Most of the soaps and washes mentioned for the destruction of fleas will exterminate lice if they be repeated as I have suggested. A solution of sulphuret of potassium or sulphuret of calcium will be found a useful agent, as is also the infusion of tobacco or stavesacre. Sulphuret of calcium solution is made by boiling togehter lime and sulphur—lime, 1lb.; sulpnur 2lbs.; water, two gallons. These are gradually mixed, then boiled down to about one gallon, allowed to cool, and the clear liquid poured off for use. It is a somewhat caustic solution, and should be mixed with an equal quantity of water for use, and washed off a quarter of an hour after being applied. An infusion of stavesacre is made by macerating an ounce of the bruised seeds in a pint of warm water. Tobacco may be employed in the same way, but neither should be boiled, as the active principle is thus partially lost. It has been pointed out by Mr. Dalziel that "the destruction of the dog louse is of vast importance not only because of the discomfort it causes the dog but for the far weightier reason that the louse is the medium for hatching the eggs and assisting the development of the cucumerine tapeworm, a variety of intestinal parasite from ten to twenty inches long and very common in English dogs." Quoting Professor Cobbold, he tells us how this occurs. The joints of the tapeworm escaping from the dog become adherent to the hairy coat; the eggs contained in them are readily swallowed by th louse, in whose body they are hatched and constitute a cysticercus or bladder-worm. The louse thus infected may be swallowed by the dog, and thus the cysticercus reaches the intestine of the dog and develops into the mature tapeworm.

Ticks are not such a common source of annoyance to the dog as fleas and lice. They are, however, more difficult to destroy. There are different views as to the manner in which they attach themselves to the skin. I accept the explanation that they plunge deeply into the skin a serrated beak, anatomically similar to the bee's sting. The grip thus obtained is such that it is easier to break the insects than detach it. Ticks offer quite a different appearance according to their state of distension. From a small gray creature, not unlike the louse, they alter to a dark-colored round object as large as a pea. When few exist they may be picked off. The stronger applications recommended for lice may be used with confidence to remove ticks.—*W. Hunting, F.R.C.V.S., in Land and Water.*

STRAYS.—Seven thousand dogs were taken to the New York pound in the season which closed last week.

THE PHILADELPHIA DOG SHOW.

THE second fall dog show of the Philadelphia Kennel Club, in conjunction with the Pennsylvania Agricultural Society, commenced to-day. It has rained nearly all day, and exhibitors, visitors and dogs have been very uncomfortable. The dogs are benched in cattle sheds and there has not been sufficient light to see them to advantage. The judging rings were in open sheds without floors and the muddy ground was covered with straw, making it impossible to form a correct idea of the movement of the animals. There are 465 entries. So far as we have been able to examine, the quality is good. There are quite a number of animals that appear for the first time, and many of them appear from a casual examination to be excellent specimens. There has not been a large attendance at the fair grounds to-day, but judging from the crowds around the dogs, they have received more attention than all the other exhibits. Nearly all of the judging was finished to-day, had the weather been good it would probably all have been done. The judges were as follows: Mastiffs, St. Bernards and Newfoundlands, Edward Dudley, Esq., Camden, N. J.; collies, A. S. Apgar, Esq., New York; deerhounds, greyhounds, Italian greyhounds and whippets, J. R. Pierson, Esq., Brooklyn, N. Y.; pointers, B. F. Seitner, Esq., Dayton, O.; English, Irish and Gordon setters, Charles S. Westcott, Philadelphia, Pa.; bulldogs, bull-terriers, other terriers, pugs and toys, James Mortimer, Esq., New York; beagles, dachshunde and bassett, James A. Stovell, Esq., Philadelphia, Pa.; foxhounds, Howard Lewis, Sr., Media, Pa., Mark Pennell, Esq., Ivy Mills, Pa., R. Hoffecker, Middletown, Del.

AWARDS.

MASTIFFS.—Champion.—*Dogs:* 1st, Winlawn Kennels' Homer (Cato—Queen II.). *Bitches:* 1st, Winlawn Kennel's Prussian Princess (Crown Prince—Nina).—Open—*Dogs:* 1st, W. S. Johnson's Dread (Prince Charlie—Dorothy); 2d, E. R. Coleman's Jag; 3d, A. Brock's Terror. *Bitches:* 1st, Winlawn Kennels' Rosalind (Crown Prince—Lady Rowena); 2d, C. R. Colwell's Dido II. (Cato—Queen II.); 3d, Winlawn Kennels' Hebe (Cato—Queen II.). Very high com., Winlawn Kennels's Liberty (Crown Prince—Ilford Baroness). Puppies—*Dogs:* 1st, C. R. Colwell's David (Danger—Dido II.); 2d, C. R. Colwell's Brother (Danger—Dido); 3d, W. B. Rowland's Ajax (Don—Clytie); Very high com., E. W. Jester's Count Waldo (Buck—Gypsey). Com., A. Brock's Terror. *Bitches:* 1st, Winlawn Kennels' Penelope (Homer—Queen II.); 2d, C. R. Colwell's Dora (Danger—Dido II.) Very high com., A. Graut's Miss Hildebert (Hildebert—Regina).

NEWFOUNDLANDS.—Champion—1st, J. A. Nickerson's Sam (Goliath—Dora).—Open—1st, Dan O'Shea's Bruno (Carlo—Nell); 2d, G. Schoen's Carlo; 3d, Peter S. Frick's Fido. Very high com., C. Dittess's Hero (Rover—Daisy). High com., Frank Read's Rover, Com., Wm. Lendrum's Nell.

COLLIES.—Champion—*Dogs:* 1st, Sans Souci Kennels' Ben Nevis (Eclipse — Meta).—Open—*Dogs:* 1st, Associated Fanciers' Royboy (Roy—Nellie); 2d, G. H. Whitehead's Robin Adair II. (Robin Adair—Lark); 3d, Jas. Lindsay's Joe Nettles (Rex—Jennie Nettles). *Bitches:* 1st, Sans Souci Kennels' Mavis (Eclipse—Nesta); 2d, Sans Souci Kennels' Wanda (A.K.R. 1924); 3d, Mill Brook Kennels' Meg and litter (Tweed II.—Lass o' Lowrie). High com., Mitchell Harrison's Dot (Rex—Jersey Lily). Com., J. Lindsay's Jeannie Nettles (Sweep—Lassie). *Puppies:* 1st, M. Harrison's Dot (Rex—Jersey Lily); 2d, J. Lindsay's Portland (Rex—Jersey Lily); 3d, Sans Souci Kennels' Daisy (Tom—Lassie).

ROUGH-COATED ST. BERNARDS.—*Dogs:* 1st, W. Burgess's First Choice (Boniface—Bessie II.); 2d, W. J. Ehrich's Nero; 3d, Buena Vista Kennels' Julien (Cæsar—Daphne). Com., Hospice Kennels' St. Maurice (Lebeau—Mina). *Bitches:* 1st, Buena Vista Kennels' Stella (Thor—Augusta); 2d, Mill Brook Kennels' Bertha (Bruno—Elsa); 3d, Hospice Kennels' Theila (Monarque—Bonnet). Very high com., Mill Brook Kennels' Norah (Bayard—Stella). *Puppies:* 1st, Buena Vista Kennels' Julien (Cæsar—Daphne II.); 2d, Mill Brook Kennels' Lys (Hermit—Limbra). High com., Hospice Kennels's St. Maurice (Lebeau—Mina).

SMOOTH-COATED ST. BERNARDS.—Champion—*Dogs:* 1st, Mill Brook Kennels' Verone (Rex—Alma II.).—Open—*Dogs:* 1st, H. H. Chittenden's Erust (Rex—Alma I.). *Bitches:* 1st, E. J. Birmingham's Bess; 2d, Mill Brook Kennels' Snowball (Fido—Dina); 3d, S. J. Martinet's Abra (Mitre—Brunhild). Very high com., Hospice Kennels' Belline II. (Barry—Belline I.). *Puppies:* 1st, W. S. Kingsland's Prince (Lohengrin—Zug); 2d, J. E. Wilkinson's Maud (Dirk—Abra). Very high com., Hospice Kennels' Belline II. (Barry—Belline I.). High com., Mill Brook Kennels' Lionel (Alp II.—Alma). Com., L. Blank's Nellie (Dirk—Alva).

DEERHOUNDS.—Champion—1st, Clovernook Kennels' Mac (Paddy—Lassie).—Open—1st, withheld; 2d, Clovernook Kennels' Noble (Mac—Mercia).

GREYHOUNDS.—Champion—*Dogs:* 1st, H. W. Smith's champion Memnon (Caliph—Polly). *Bitches:* 1st, H. W. Smith's Mother Demdyke (Pensive Laddie—Playmate).—Open—*Dogs:* 1st, H. W. Smith's Ben (Cremorne—Lioness); 2d, B. W. Smith's Wertheim (Beardwood—Lady Browne). *Bitches:* 1st, H. W. Smith's Stealing Away (pedigree unknown); 2d, I. H. Shepherd's Lady Halifax (Frank—Fly). High com., E. Loeb's Saturday Night. *Puppies:* 1st, Mrs. B. Labe's Prince.

POINTERS.—Over 55lbs.—*Dogs:* 1st, Clifton Kennels' Donald II. (champion Donald—Devonshire Lass); 2d, C. J. Peshall's Jimmie (Start—Maud); 3d, E. I. Martin's Baugor (Bang—Jean). *Bitches, over 50lbs.:* 1st, withheld; 2d, A. H. Craige's Beulah (Sam—Vivian); 3d, C. Jacob's Neily (Captain—Tilley).—Champion—Under 50lbs.—*Bitches:* 1st, Clifton Kennels' Daisy Bravo (champion Bravo—Lilly II.).—Open—Under 55lbs.—*Dogs:* 1st, P. C. Ohl's Shot (Sensation—Rose); 2d, Westminster Kennel Club's Castor (Bang Bang—Polly); 3d, A. W. Tobey's Adonis. Very high com., R. C. Cornell's Prince of Orange (Sensation—Lass). High com., D. P. Ayars's Dash (King—Dixie). *Bitches, under 50lbs.:* 1st, Westminster Kennel Club's Lucky Stone (Tony—Moonstone); 2d, Clifton Kennels' Lady Belle (Bang Bang—Polly); 3d, Surrey Kennels' Bellegarde (Marshall Ney—Tallulah). Very high com., Clifton Kennels' Rosa (Boon—Rena). High com., Westminster Kennel Club's Nancy (Bang Bang—Polly) and Lady Dufferin (Dash—Fan). Com., A. Brock's Virginia (Tramp—Grace). Puppies—*Dogs:* 1st, T. H. Farquhar's Mascot (King Phillip—Dash); 2d, J. B. Trissler's Gem Beaufort (Beaufort—Nellie Bird). High com., A. Mears's Point (Frank—Florence). *Bitches:* 1st, W. M. Haldeman's Leda (A.K.R. 2036); 2d, H. J. Bennet's Genesta (Pete—Belle). Very high com., J. S. Wibirt's Dorcas II. (Beaufort—Faustina).

ENGLISH SETTERS.—Champion—*Dogs:* 1st, Frank Windholz's Rockingham (Beltinus—Bess). *Bitches:* 1st, P. C. Ohl's Petrel II. (Pride of Border—Petrel).—Open—*Dogs:* 1st, E. W. Jester's Glen Rock (Druid—Princess Draco); 2d, W. Yewdall's Tug (Thunder—Peg); 3d, E. I. Martin's Don Juan (Tam O'Shanter—La Reine). Very high com., P. C. Ohl's Storm Petrel (Don Juan—Petrel III.). High com., P. C. Ohl's Dashing Monarch (Dash II.—Countess Moll). *Bitches:* 1st, R. C. Cornell's Modesta (Jester—Modesta); 2d, John Yewdall's Blitz (Thunder—Peg); 3d, E. T. Martin's Fairy III. (Prince—Fairy II.). Very high com., P. C. Ohl's Dame Petrel (Don Juan—Petrel III.); E. I. Martin's Queen Petrel (Thunder—Petrel); E. I. Martin's Countess Warwick (Warwick—Ollie); E. W. Jester's Dashing Belle (Dashing Monarch—Blue Belle); H. Pape's Lady May (Lofty—Maud Muller). High com., E. Comfort's Cassino Gladstone (Gladstone—Countess Druid); T. B. Stulb and W. M. Wood's Belle (Dan—Rue); P. C. Ohl's Blue Belle (Rattler—Daisy). Puppies—*Dogs:* 1st, H. W. Johnson's Tug Junior (Tug—Floss); 2d, P. C. Ohl's Soudan (Druid—Ruby) *Bitches:* 1st, H. W. Johnson's Bella (Tug—Floss); 2d, P. C. Ohl's Glen Ada (Glen Rock—Blue Belle). Very high com., George Fox's Princess Katie (Prince Al—Maiden). High com., H. J. Rice's Idylwoof (Antic—Princess Mix).

IRISH SETTERS.—Champion—*Dogs:* 1st, Max Wenzel's Chief (Berkley—Duck). *Bitches:* 1st, I. H. Roberts's Lady Clare (Elcho—Rose).—Open—*Dogs:* 1st, E. W. Clark's Blarney (Bruce—Luray); 2d, I. H. Roberts's Bruce (Elcho—Noreen); 3d, H. B. Goetchius's Chief II. (Chief—Doe). Very high com., Max Wenzel's Chief, Jr. (Chief—Doe). High com., C. H. Kuhn's Leon (Chief—Leigh Doane), G. W. Bush, Jr.'s Guy (King Bow—Norah) and Max Wenzel's Tim (Biz—Hazel). Com., C. W. Roedenburg's Chip (Chief—Doe) and Patrick Russ's Elcho III. (Elcho—Rose). *Bitches:* 1st, I. H. Roberts's Jessie (Elcho—Noreen); 2d, W. W. Kendall's Lorna Doone (Berkley—Maud); 3d, I. H. Roberts's Leigh Doane (Elcho—Rose). Very high com., E. Volmer's Nellie (Glencho—Bess) and I. H. Roberts's Little Nell (Elcho—Rose). High com., S. Barr's Hazelnut (Berkley—Madge) and I. H. Roberts's Hebe (Chief—Hazelnut). Com., Max Wenzel's Jersey Beauty (Chief—Doe). Puppies—*Dogs:* 1st, R. H. Spalding's Garry (Glencho—Red Lassie); 2d, S. Barr's Glen (Glencho—Hazelnut). Com., J. S. Brown's Glenchovic (Glencho—Vic). *Bitches:* 1st, T. J. Farley's Neebe (Glassy—Glencore); 2d, W. J. Holly's Floss.

GORDON SETTERS.—Champion—*Dogs:* 1st, H. Clay's Turk (Dash—Belle).—Open—*Dogs:* 1st, E Maher's Royal Duke (champion Bob—champion Nell); 2d, Linn Hartranft's Bob (Sam—Nell); 3d, E. G. Webb's Don (Don—Jennie). *Bitches:* 1st, H. C. Glover's Nora (Sport—Clara), 2d, D. O'Shea's Belle (Blossom—Moll). High com., G. Mac Miller's Grace. *Puppies:* 1st, W. J. Keegan's Flora Temple (Dash—Eliza); 2d, I. M. Jordan's Shot (Don—Edith).

IRISH WATER SPANIELS.—2d, James Gilson's Dash (Leo—Duck).

FIELD SPANIELS.—Champion—Any Color, over 28lbs: 1st, A. C. Wilmerding's Black Prince (A.K.R. 62).—Open—1st, G. H. Whitehead's Pluto (A.K.R. 1879); 2d, A. C. Wilmerding's Newton Abbot Lady (A.K.R. 2091); 3d, Associated Fanciers' Pascha (Obo II.—Critic). High com., P. H. Clark's Coaley (Bob—Gyp).

COCKER SPANIELS.—Champion—Any Color, under 28lbs.—1st, A. E. Rendle's Brahmin (Bob—Clew).—Open—Black and Liver—*Dogs:* 1st, W. H. Tuck's Othello (A.K.R. 1932); 2d, Hornell Spaniel Club's Hornell Jock (Dandy—Spider); 3d, A. Laidlaw's Obo, Jr. (Obo—Nellie). Very high com., C. R. Lewis's Nigger. *Bitches:* 1st, A. Laidlaw's Laidlaw's Belle (Silk—Flirt); 2d, S. R. Hemingway's Miss Nance (A.K.R. 1313); 3d, Hornell Spaniel Club's Hornell Flora (Beau—Rhea II.). Very high com., H. Whitaker's Dell. High com., C. R. Lewis's Virginia. Com., Hornell Spaniel Club's Hornell Ida (Silk—Daisy II.).—Any Other Color—1st, A. C. Wilmerding's Marion and pups (Brag—Princess); 2d, Hornell Spaniel Club's Hornell Belle II. (Dandy—Belle). *Puppies:* 1st, Wm. H. Tuck's Alice Obo (Obo, Jr.—Phonsie); 2d, Wm. West's King Coal (A.K.R. 2585). Very high com., Hornell Spaniel Club's Hornell Sport (Silk—Maid) and John Lynch's Wonder.

CLUMBER SPANIELS.—1st, M. Richardson's New Castle (Ben—Juan); 2d, M. Richardson's Bateman; 3d, M. Richardson's Tyne (Ben—Joan.

FOXHOUNDS.—Champion—*No entries.*—Open—*Dogs:* 1st, J. J. Hickman's Jerry (Royal Duke—Twilight); 2d, Dr. Prizer's Ringer (Juggler—Lucy); 3d, Dr. Prizer's Whiskey (Ring—Fannie). *Bitches:* 1st, Dan O'Shea's Ranger (Ringwood—Roxey I.); 2d, J. J. Hickman's Jessie (Boxer—Ann). Very high com., Dan O'Shea's Roxey II. (Ringwood—Roxey I.) *Puppies:* 1st, Dr. Prizer's Cricket (Whiskey—Lydia); 2d, Dr. Prizer's Sheridan (Whiskey—Lydia). *Couples:* 1st, Dan O'Shea's Roxey II. and Ranger (Ringwood—Roxey I.).

BEAGLES.—Champion—Over 12in.—1st, D. O'Shea's Rattler (Rome—Music). Very high com., P. Dorsey's Lee (Warrior—Rosey).—Open—*Dogs:* 1st, L. Sloan's Rattler III. (Rattler—Music); 2d, J. Satt rthwaite's (Kino); 3d, H. C. Wolfe's Duce (Rattler—Sprightly). *Bitches:* 1st, D. O'Shea's Mischief (Rattler—Hasty); 2d, L. H. Twaddell's Millicent; 2d, P. Dorsey's Flight (Ringwood—Juliet).—Under 12in.—1st, W. F. Streeter's Marchboy II. and Magnet (Marchboy—Myrtle); 3d, D. O'Shea's Fannade (Rattler—Music II.). *Puppies:* 1st, L. Sloan's Cricket (Bounce—Myrtle); 2d, H. C. Wolfe's Topsey (Duce—Juno).

BASSETS.—1st, C. B. Gilbert's Bertrand (Bourbon—Cigarette); 2d, Maizeland Kennels' Nemours (Jupiter—Vivian).

DACHSHUNDE.—1st, withheld; 2d, Valentine Friehl's Waldine.

WHIPPETS.—No entries.

BULLDOGS.—Champion—1st, John E. Thayer's Bellissima (Sancho Panza—Romping Girl).—Open—*Dogs:* 1st, John E. Thayer's Remus (Byron II.—Rhodora); 2d, C. R. Snowden's Crib (Boxer—Joanna). *Bitches:* 1st, J. E. Thayer's Britomartis (Monarch—Penzie); 2d, withheld. High com., A. E. Norris's Duchess (Royal Duke—Hornet). Com., J. H. Sanderson's Bonnie Duchess (Sancho—Peppo). *Puppies:* 1st, J. E. Thayer's Ramona (Robinson Crusoe—Bellissima).

BULL-TERRIERS.—Champion—No entries.—Open—*Dogs:* 1st, R. H. Dudgeon's Dutch, Jr. 2d withheld; *Bitches:* 1st, Frank F. Dole's White Rose (Victor Chief—Bess); 2d, R. H. Dudgeon's Gypsy. Very high com., S. Hanford's Violet (Prince—Lilly). *Puppies:* 1st, Frank F. Dole's The Baron (Dutch—White Rose).

BLACK AND TAN TERRIERS.—Champion—Over 7 lbs.—No entries.—Open—1st withheld; 2d, Lizzie E. Tomson's Beauty (Zip—Minnie).

FOX-TERRIERS.—Champion—*Dogs:* 1st, J. E. Thayer's Raby Tyrant (Bailiff—Peach). *Bitches:* 1st, J. E. Thayer's Richmond Olive (Tart—Jess).—Open—*Dogs:* 1st, A. Belmont, Jr.'s, Regent Vox (Tackler—Sandy Vie); 2d, Clovernook Kennels' Scarsdale (Joker—Ella); 3d, R. Lyon's Richmond Jockey (Marlborough Jockey—Twinkle). Very high com., H. A. North's Dan. High com., R. I. Crocker's Brokenburst Spice II. (Brokenburst Spice—Deacon Ruth); T. B. Wanamaker's Hapton Toby (Roysterer—Tingle). *Bitches:* 1st, Clovernook Kennels' Delta (Joe—Rank); 2d, J. E. Thayer's Di (Rally Tyrant—Richmond Olive); 3d, G. W. Bush's Nettie (Vicar—Gypsy). High com., S. Andrews's Maggie. Puppies—*Dogs:* 1st, Clovernook Kennels' Clover Ted (Mixture—Spite); Clovernook Kennels' Clover Turk (Mixture—Spite). Very high com., J. L. Banks's Spot (Primrose—Swansdown). *Bitches:* 1st, W. B. James's Blossom (Crisp—Vic); 2d, Dan O'Shea's Geraldine (Mixture—Venom III.). High com., S. Lumb's Lady (Crisp—Vic). Com., B. Cunningham's Foxey (Jesse James—Flirt).

FOX-TERRIERS.—Rough Haired.—1st, R. H. Barlow's Vero Venture (Victor—Beryl Broad); 2d, R. H. Barlow's Bundle (E.K.C.S.B. 12,471). Very high com., R. H. Barlow's New Year's Day (Gip—Nettle); R. H. Barlow's Tiny Todger (Toger—Nettie). High com., R. H. Barlow's Flossie la Muguet (New Boy—Peddie Broad).

IRISH AND ROUGH-HAIRED TERRIERS.—1st, Dan O'Shea's Jim (Garry Owen—Ilian); 2d, C. T. Thompson's Mustard.

BEDLINGTON TERRIERS.—*Dogs:* 1st, F. P. Kirby's Beresford (Sting—Wasp). *Bitches:* 1st, Dan O'Shea's Jule.

SKYE TERRIERS.—1st, W. P. Sanderson's Jim (Berkie—Highland Mary); 2d, J. Howard's Skye (Jim—Skye); 3d, W. P. Sanderson's Lass O'Gowrie (Jim—Queen Mab).

YORKSHIRE TERRIERS.—Over 5lbs.—1st and 2d, Mrs. Jane Parker's Charlie D. (Dreadnaught—Nellie) and Dude D. (Duke—Princess). Very high com., Mrs. J. Parker's Jennie B. (Duke—Nellie).—Under 5lbs.—1st, J. Healey's Eber (Royal—Flora).

TOY TERRIERS.—Other than Yorkshire, under 7lbs.—1st, Ella E. Browne's Tiney (Frank—Tip); 2d, F. W. Sutterle's Pawsee. Very high com., E. B. Hirst's Flora (Burnside—Buttercup).

PUGS.—*Dogs:* 1st, Mrs. W. D. Peck's Bradford Ruby (Lovat—Jennie); 2d, Miss S. Meek's Max (Roderick—Dolly); 3d, Mrs. J. W. Mercur's Puck (George—Judy). Very high com., John Parker's Punch D. (Punch—Judy). Com., F. P. Bannon's Toby and Mrs. J. B. Reddie's Rajah. *Bitches:* 1st, A. H. Moore's Miss Kitty (George—May); 2d, M. H. Dryer's Kitty (Roderick—Ollie). *Puppies:* 1st, Chequasset Kennels' Thunder (Young Toby—Lady Flossie); 2d, Dr. M. H. Dryer's Bessie (Othello—Dolly). Very high com., Chequasset Kennels' Tiney (Young Toby—Lady). Com., Mrs. J. W. Mercur's Judge (Puck—Bijou).

KING CHARLES SPANIELS.—1st, J. B. Reddie's Pitou (Sancho—Onida); 2d, J. B. Reddie's Nellie. Very high com., Mary E. Ward's Otto; J. Parker's Jumbo D. (Ben—Littleton). Com., J. Parker's Countess B. (Duke—Queen).

BLENHEIM SPANIELS.—1st, Wm. Phillips's King Victor; 2d, Miss M. Phillips's King Pippin (Bowsie—Countess Blennie). Very high com., Miss L. Harr's Chappy (Randolph—Lady); Miss M. Parker's Charlie D. (Prince—Violet). High com., Miss M. Parker's Violet B. (Scamp—Countess). Com., Miss M. Parker's Rubes B. (Prince—Violet).

ITALIAN GREYHOUNDS.—1st, Annie K. Kramer's Romeo (Dick—Neppie); 2d, A. L. Belleville's Tiney (Romeo—Baby).

ULMERS.—1st, T. O'Brien's Markoe; 2d, C. Wagner's Spot (Smith's dog—Eckbert's bitch). Very high com., J. P. McQuaide's Rover. High com., P. Stamp's Tiger (Rover—Kate).

MISCELLANEOUS.—1st, Alex Burden's Nellie; 2d, Glencoe Collie Kennels' bobtail sheepdog Bob; 2d, M. C. Harvey's Chesapeake dog Rover.

FOXHOUND PACKS.—1st, Jesse J. Hickman's Joe, Spot, Pete, Storm, Hornet, Rowdy, Pilot, Jessie Jerry, Count, Scuddy and Sport. 2d, George W. Hill's Boston, Bell Mai, Brandy, Hornet, Homer, Dido, Corlies, Amy, Trooper, Tinker, Milo and Reuben.

KENNELS.—Mastiff Kennels.—1st, Winlawn Kennels' Prussian Princess, Homer, Rosalind, Liberty and Rebe. St. Bernard Kennels.—1st, Mill Brook Kennels' Beryl, Norah, Bertha, Lys, Verone, Snow Ball, Lindan and Lionel. English Setter Kennels.—1st, Rancocas Kennels' Petrel II., Storm Petrel, Dashing Monarch, Dame Petrel, Vanette, Blue Belle, Coomassie, Soudan and Glen Ada. Irish Setter Kennels.—1st, I. H. Roberts's Bruce, Leigh Doane, Hebe, Jessie and Little Nell. Small Pointer Kennels.—1st, Westminster Kennel Club's Castor, Nancy, Countess, Lady Dufferin, Luckystone and Jill. Greyhound Kennels.—1st, H. W. Smith's Memnon, Fan, Mother Demdike, Ben and Stealing Away. Collie Kennels.—1st, Sans Souci Kennels' Mavis, Wanda, Daisy, So So and Ben Nevis.

YORK COUNTY DOG SHOW.—Wrightsville, Pa., Oct. 2.—*Editor Forest and Stream:* The dog show to be held in connection with the York County Fair on Oct. 7, 8, and 9, has been abandoned, owing to a want of entries, which, no doubt, has its cause in the holding of a bench show at Philadelphia the same week. Next year another effort will be made at York.—A. C. Krueger.

WESTERN FIELD TRIALS.—Kansas City, Mo., Oct. 6.—The entries both to puppy and all-aged stake in Western trials close Oct. 15.—A. A. Whipple (Secretary and Treasurer).

DAYTON SHOW.

THE third annual dog show of the Southern Ohio Fair Association was held at Dayton Sept. 29 to Oct. 1. Following is the list of awards:

AWARDS.

MASTIFFS.—1st and 2d, A. Frinkle's Rock and Flora.

ST. BERNARDS.—1st, Mrs. Emma F. Hill's Abbess; 2d, L. S. Olt's Jumbo.

NEWFOUNDLANDS.—1st, C. Hanitch's Jumbo; 2d, C. Sander's Jeff.

GREYHOUNDS AND DEERHOUNDS.—1st, Geo. Parvin's Major; 2d, Landseer Kennels' Twilight. Very high com., Landseer Kennels' Snowflight and D. B. Conklin's Fannie. High com., Sander's and ——— King William. Com., A. G. Meakin's Victoria.

ENGLISH SETTERS.—*Dogs:* 1st and 2d, John Bolus's Britton and Blue Dick. Very high com., W. A. Simms's Dick. *Bitches:* 1st, Kyler & Keely's Topsy S.; 2d, Geo. A. Hill's Belle. Very high com., Theo. Potter's Glenn, Jas. Ritty's Carrie, Kyler & Keely's Slip and ——— Minnetta. *Puppies:* 1st, Geo. H. Voker's Lady; 2d, E. R. Watrous's Red Wine. Very high com., E. R. Watrous's Early Dawn. High com., W. H. Brown's Grouse.

GORDEN SETTERS.—1st, J. F. Campbell's Prince.

IRISH SETTERS.—*Dogs:* 1st, W. N. Kuhn's Mack; 2d, A. S. Bickham's Dash. Very high com., Hitch & Chisolm's Jack Odono. High com., W. F. Koontz's Sweep. *Bitches:* 1st, withheld; 2d, A. Sander's Lady Smizer. High com., J. R. Schuster's Fannie. *Puppies:* 1st, E. M. McIntire's Jim; 2d, A. M. Gillett's Bob.

POINTERS.—Champion—B. F. Seitner's Lady Croxteth.—Open—*Dogs—over 55lbs.:* 1st, W. Sabrey's Rock; 2d, W. A. Simms's Tom. Very high com., Dr. L. E. Russell's King's Boy. *Under 55lbs.:* 1st, Kyler & Keeler's Leon; 2d, B. F. Seitner's Rapp. Very high com., Hitch & Chisolm's King Hal. *Bitches—any weight;* 1st, Very high com. and high com., B. F. Seitner's Lillie Bang, Lass and Lulu Faust; 2d, Kyler & Keeler's Lillie Faust. Very high com., G. Sander's Diana, R. Wood's Sister and C. Whealan's Folly. *Puppies—under 18 months:* Very high com., G. Sander's Bull's Eye and C. Hanitch's N. Y. P. & O. High com., J. Ritty's Tippecanoe and Hitch & Chisolm's Jack.

COCKER SPANIELS.—1st, C. W. Sander's Bob; 2d, B. P. Critchell's Fancheon. Very high com., C. R. H. Cohan's Beauty.

KING CHARLES SPANIELS.—1st, Mrs. M. L. McKee's Felise; 2d, Chas. Sander's Victoria.

FOXHOUNDS.—1st, 2d, very high com. and com., G. L. Makely's Lord, Sport, Ceoter and Dick.

BEAGLES.—1st, Mrs. Carl White's Bennie; 2d, C. Schwein's Marjory.

DACHSHUNDE.—1st and 2d, Idstone Kennels' Wallexie and Prince

BASSET HOUNDS.—1st and 2d, Idstone Kennels' Nimrod and Countess.

FOX-TERRIERS.—1st, W. B. Brueckner's Spot.

COLLIES.—1st, H. W. Frank's Fritz.

BULLDOGS.—1st, H. Cohan's Dick. Very high com., W. H. Clark's Jim. High com., H. Justice's Gem.

BULL-TERRIERS.—1st, withheld; 2d, J. Cray's Jasper. Very high com., Pat Brannan's Jack.

BLACK AND TAN TERRIERS.—1st and high com., Mrs. Carl White's Dandy and Dixie; 2d, H. Justice's Euchre. High com., J. E. Englehart's Beauty, and C. Sander's Tippys; C. Louisa Mackrodt's Tippy.

YORKSHIRE TERRIERS.—1st, Mrs. J. Englehart's Paddy.

MISCELLANEOUS.—1st, J. Englehart's Maltese Pedro; 2d, A. Sander's black poodle Rumpty. Very high com., G. Sullivan's Italian greyhound Maud S.; H. Detmering's Dolly and J. Englehart's Pearl.

SPECIAL PRIZES.

Best kennel of pointers, Idstone Kennels; best pointer in Montgomery county, Idstone Kennels' Lillie Bang; best pointer bitch with three of her progeny, Idstone Kennels' Lass; best puppy, Kyler & Keeler's Leon; best litter pointer puppies, Alfred Kyler's Dave; best matched brace in county, Idstone Kennels' Lady Croxteth and Rapp; best puppy in county, Idstone Kennels' Lady Jane; best dog in open class, Kyler & Keeler's Leon; best puppy (two) in Dayton, Idstone Kennels' Lillie Bang; best kennel sporting dogs, Idstone Kennel; best Irish setter dog in county, W. N. Kuhn's Mack; best brace in county, A. S. Bickham's Dash and Bob. Best setter or pointer bitch, Idstone Kennels' Lillie Bang. Best brace English setters, John Bolus's Britton and Blue Dick; best puppy, G. H. Volker's Lady. Best beagle, Mrs. Carl White's Bonnie. Best basset hound, Idstone Kennels' Nimrod. Best Irish setter dog in Dayton, W. N. Kuhn's Mack. Best pug in Dayton, Mrs. Jas. Legler's Judy; best pug in open class, ——— Pip. Best Yorkshire terrier in Dayton, Mrs. J. Englehart's Paddy. Best toy spaniel, Mrs. M. L. McKee's Felise. Smallest toy owned by a lady, Mrs. Carl Hinderland's Pettis. Best St. Bernard, Mrs. E. F. Hill's Abbess. Best brace foxhounds, G. L. Makely's Lord and Sport. Best Newfoundland, C. Hanitch's Jumbo. Best King Charles spaniel owned by lady in Dayton, Mrs. M. L. McKee's Felise. Best field spaniel, C. W. Sander's Bob. Best pair of dachshunde or beagles, Idstone Kennels' Wallexie and Prina. Best St. Bernard, Mrs. Emma F. Hill's Abbess. Best greyhound, Geo. Parvin's Major. Best black and tan terrier, Mrs. Carl White's Dandy. Best trick dog, C. Sander's Nellie. Best pointer or setter, John Bolus's Briton. Best in miscellaneous class, J. Englehart's Pedro. Best Kennel English setters, Miami Kennels.

HOW TO BREAK A DOG OF GUNSHYNESS.—Jonas Hamilton, the superintendent of the Portland & Ogdensburg Railroad, is an inveterate sportsman, writes "Songo." Not long since Jonas had a setter sent him from Massachusetts, which proved to be gunshy. Jonas thought he could take him on the marsh and break him of his fear of the gun, and so one morning found him and the dog on Scarboro marsh. One end of a good strong cord was attached to the dog's collar and the other end to the strap of Jonas's bootleg. A bird soon arose; Jonas pulled up and fired; the dog heard the report, took up slack line on the dead jump and brought Jonas to the grass several seconds before the bird touched the turf. The dog's momentum was such that Jonas dragged several yards through the soft muck, before he was aware of the full extent of the accident, but like all true sportsmen he clung to his gun and as soon as the stars stopped twinkling, turned the remaining charge into the dog's carcass. Jonas now declares that the only way to break a dog of gunshyness is to break his neck.—*Portland Argus.*

THE IRISH WOLFHOUND.—Perth Ontario, Sept. 26.—*Editor Forest and Stream:* The articles which have appeared in your columns relative to the Irish wolfhound have been read by me with great interest. I have been unable to gather from them, however, whether the wolfhound would run by scent, and as I have a Scotch deerhound I am anxious to know whether the latter would be a satisfactory dog to run deer with in this country. My dog appears to use her nose when in the woods, but as yet I have been unable to give her a satisfactory trial as she is still quite young. Perhaps some of your readers will have the kindness in your columns to throw some light on the subject of the usefulness of the Scotch deerhound in running deer by scent in a wooded country. If they can be got to depend mainly upon the nose in running they would be invaluable.—Rifle.

BEAGLE LOST.—A black, tan and white beagle bitch (badly ruptured) has been lost by C. B. Ludekins, Port Richmond, Staten Island.

KENNEL NOTES.

KENNEL NOTE BLANKS.

For the convenience of breeders we have prepared a series of blanks for "Names Claimed," "Whelps," "Bred" and "Sales." We request that all Kennel Notes be sent to us on these blanks, which will be forwarded to any address on receipt of stamped and directed envelope. Send for a set of them.

NAMES CLAIMED.

Tom Tucker, Ran Tucker and Lady Tucker. By Dr. J. J. Board, Lynch's, Va., for black, tan and blue ticked foxhounds, two dogs and one bitch, whelped July 18, 1885, by Brodnax's Speck out of owner's Crowd (Sailor—Music).

Ben Butler. By Jos. L. Whittaker, South Groveland, Mass., for black cocker spaniel dog, age not given, by Hornell Silk (A.K.R 1397) out of Hornell Dinah (A.K.R. 66).

Puritan and F. C. Dudley. By Elm Grove Kennels, Stubridge, Mass., for lemon and white pointer dogs; whelped July 1, 1885; by Duke Royal (A.K.R. 2472) out of Gain Day (A.K.R. 2634).

Buena Vista Kennels. By Wm. H. Fuller, New York, for his kennel of St. Bernards.

BRED.

Nell—Rags. Al Ward's bull-terrier bitch Nell to E. L. Bailey's Rags (A.K.R. 2557), Sept. 28.

Mystic—Bannerman. Dr. J. J. Board's (Lynch's, Va.) beagle bitch Mystic (Ringwood—Myrtle) to Bannerman (A.K.R. 1709), Sept. 28.

Bugle—Lead. E. W. Jester's (St. George's, Del.) beagle bitch Bugle to his Lead, Sept. 29.

Tiny—Silk Socks. A. L. Belville's (Philadelphia, Pa.) Italian greyhound bitch Tiny (Romeo—Baby) to E. W. Jester's Silk Socks (Spirt—Pearl), Sept. 14.

WHELPS.

Zoe. A. W. Adams's (East Bethlehem, Pa.) English setter bitch Zoe (A.K.R. 2009), Sept. 28, seven (four dogs), by Scott (Rob of Roy—Cloudy).

Crowd. Dr. J. J. Board's (Lynch's, Pa.) foxhound bitch Crowd (Sailor—Music), July 18, five (four dogs), by Brodnax's Speck.

Daphne. Charles S. Fitch's (New York) cocker spaniel bitch Daphne (A.K.R. 1683), Oct. 1, eight (one dog), by Brahmin; two since dead.

Daisy Queen. Howard Hartley's (Pittsburgh, Pa.) English setter bitch Daisy Queen (A.K.R. 236), Oct. 3, six (four dogs); by the Druid, Jr. (Druid—Swag).

Ruby. H. E. Hamilton's (Hackensack, N. J.) English setter bitch Ruby (Rake—Fanny), July 29, eight, (five dogs), by B. F. Wilson's Count Noble (Count Wind'em—Norna).

Laffie. J. V. Vail's mastiff bitch Loftie (Duke—Fawn), Oct. 2, six (two dogs), by E. W. Jester's Count Waldo (A.K.R. 1501).

SALES.

Norma. Red Irish setter bitch, whelped July 3, 1883 (Elcho—Noreen), by Ashmont Kennels, Boston, Mass., to Freestone Kennels, Middletown, Conn.

Lurline. White and orange English setter bitch, whelped March 12, 1884 (Don—Daisy), by F. Thurlo, Newburyport, Mass., to Freestone Kennels, Middletown, Conn.

Planeta. Black and white English setter bitch, whelped May 1, 1885 (Plantagenet—Matchless), by F. Thurlo, Newburyport, Mass., to Freestone Kennels, Middletown, Conn.

Blue Boy—Mystic whelp. White, black and tan beagle dog; whelped May 22, 1885, by Dr. J. J. Board, Lynch's, Va., to Frank Riesdorph, Jamestown, N. Y.

Speck—Crowd whelps. White, black and tan; and black, tan and blue ticked foxhound dogs; whelped July 18, 1885, by Dr. J. J. Board, Lynch's, Va., to Thos. Hubbard, Marysville, Va.

Fidge—Pink whelp. Black and tan beagle bitch, whelped June 30, 1885, by G. L. Barnes, Tyringham, Mass., to Wm. B. Ogden, New York.

IMPORTATIONS.

Isle. Tawny and white rough-coated St. Bernard bitch, whelped July 13, 1885 (Duke of Wellington—Lady Bess), by Richard H. Derby, Lloyd's Neck, L. I., from A. Barnes, London, Eng., Sept. 8.

May Flower. Mastiff bitch, whelped May 6, 1884 (champion Beau—Cambrian Princess), by Richard H. Derby, Lloyd's Neck, L. I., from H. G. Woolmore, Leyton, Essex, Eng., Sept. 9.

Jack. St. Bernard dog, age not given (Saladin—Hebe), by Mr. Elton, New York, from England, Sept. 25.

Inverauchty. Collie dog, color and age not given (Chance—Jen), by Dr. Thos. Shearer, Baltimore, Md., from England, Sept. 25.

DEATHS.

Bizorah. Red Irish setter bitch (A.K.R. 1388), owned by Freestone Kennels, Middletown, Conn.; accidentally poisoned.

Rifle and Trap Shooting.

Address all communications to the Forest and Stream Publishing Co.

FIXTURES.

Oct. 20.—First Georgia State Fair Tournament, under auspices of the National Gun Association. Judge M. R. Freeman, Manager, Macon, Ga. Beginning Oct. 20.

ANOTHER TARGET SUGGESTION.

Editor Forest and Stream:

There seems to be a demand for a new 200yds. target; one that may become a standard to be used by all the rifle clubs in the country, and although it is to be a new target, the desire is that certain old land marks shall be retained, that in a measure past records can be compared with later day performances, and it must have ten rings of such graded diameters that ties in totals, even of the rest shooters, may be avoided as much as possible, also of such size that the military may be induced also to adopt it. I submit a target that, in my opinion, is nearest to the wants of the entire shooting community of any that has yet appeared in the FOREST AND STREAM. The entire target is 4ft. square. The militiaman seldom makes a high 2 on the Creedmoor target, his misses are generally off the right edge, so our target is as wide as the old one, and high enough for all practical purposes. The dividers are set with the points 28in. apart, and the circle described is the outside ring of the old Creedmoor. The points are then closed up to 18in.; this ring is the 4 line. We have thus left a large space 10in. wide to count 3. It is the same size as the 3 on the old target. There is plenty of room for the new recruit to scatter his bullets and not cut up the finer lines in the center, which we now begin to draw, for it is inside this radius of 26in. that 90 per cent. of the marksmen place their bullets at 200yds. distance. The points are now set at 10½in. apart and a circle 21in. is described. We close the points to 8in. and make another circle 16 in. in diameter. Again we close the points to 6in. and the circle drawn is 12in. across. Now it is evident the next circle must define the edge of the bull—shall it be larger or smaller than the old one? In this we have decided to use the same 8-inch bull, so our dividers are set with the points at 4in. apart, and we describe the edge of the bull. At this point we have used considerable thought—if a marksman breaks the edge of the bull, his count on this target is 8; now if on the next shot he places his bullet 1 inch inside the edge, his count should increase one point, for let his bullet leave the edge of the bull, even but the eighth of an inch, and his count is lowered one point. Then our dividers must be set at but 3in. apart and a 6-inch circle is drawn inside the bull—it counts 9. Now the bullseye must be drawn and to puzzle the rest-shooter, we make it but 3in. in its total diameter by setting our dividers 1½in. apart.

Now we have a "combined target"—it combines the practical points of the old Creedmoor, the divisions of the so-called Massachusetts, and the finer circles in the bull of the decimal. This we submit to the riflemen of the country for their approval. W. MILTON FARROW.

THE TRAJECTORY TEST.

Editor Forest and Stream:

"W. I. C." seems to think that muzzleloader admirers are obsolete. It is gratifying to know that it by no means follows because he thinks so. It would horrify me to be obsolete—it would indeed. In my communication I used the word "vise," not because I supposed those in charge of the test would screw rifles into a vice, but simply in way of comparison. Does "W. I. C." intend to take a "muzzle rest" into the woods with him may I ask in return? My general idea was that a fixed rest would be necessary, and as this was decided on (see editorial 17th) it would seem that "W. I. C." is in the minority as far as weight of judgment goes, where he may remain if he so elects. S.

RANGE AND GALLERY.

THE WIMBLEDON PISTOL MATCH.

MR. FRED CONLIN who will be remembered by all frequenters to the well known gallery of his father at Thirty-first street and Broadway is now in London and of course visited Wimbledon during the recent meeting. He speaks of the pistol match in a recent letter saying: It was this year introduced as an afterthought, but was so successful that it will no doubt be henceforth the standard match. The shooting was done at a paper target called the "Martin Smith" target, after the gentleman introducing it. The target is a disc 12in. in diameter, having a bullseye 3in. in diameter, scoring six points. The remainder of the target is divided into four rings, scoring respectively 5, 4, 3, and 2 points. The rules of the match were distance about 20yds. with revolver provided by the Association, of any military pattern and carrying government ammunition, weight not to exceed 2lb. 3oz. The pistols to be at the firing point where the competitor can make his selection. The ammunition is provided likewise by the Association and handed to the shooter when at the firing point. Six shots to a score, position standing without rest of any kind to any part of the body. The prizes were; one of $60, one of $25, one of $20, three of $15 each, three of $10 each and six of $5 each; total $200. The leading scores stood:

Shooter.	Pistol.	Score.
Lieut. Scott	Enfield	34
Glendomwyn	Enfield	34
Hampton	Enfield	33
Holmes	Enfield	33
Oakley	Enfield	32
Lieut. J. R. Milner	Enfield	32
Parker	Webley	32
Harley	Enfield	32
Hunt	Wilkenson	31
Pratt	Wilkenson	31
Dibles	Rigby	31
Lewis	Colt's	31
Payne	Wilkenson	30
Thomas	Wilkenson	30

[In our next issue we shall give a cut of the winning target.—ED. F. AND S.]

CREEDMOOR, Oct. 3.—The ninth marksman's badge competition was shot to-day at Creedmoor. Owing to the severe storm in the morning the attendance was not as large as usual, but after the luncheon hour some good scores were made. The gold badge was won for the fifth time by John F. Klein. The best scores were as follows:

	200yds.	500yds.	Total.
J F Klein, 17th Separate Company	22	24	47
W W DeForest, 12th Regiment	23	24	47
B R Meserole, 47th Regiment	21	24	45
*T J Dolan, 13th Regiment	22	23	45
*J S Shepherd, 23d Regiment	23	23	44
S W Merritt, 7th Regiment	19	23	42
N D Ward, 9th Regiment	21	21	42
*T M Kallock, 7th Regiment	21	21	42
*W J Underwood, 7th Regiment	21	21	42
D E Watson, 71st Regiment	17	23	40
C E Bryant, 23d Regiment	20	19	39

*Winners in previous matches.

The next matches will be shot on Saturdays, Oct. 10 and 24, and on election day, Nov. 3, when the season closes.

WORCESTER, Mass., Oct. 1.—The Worcester City Guards, Co. A 2d Regiment Massachusetts Volunteer Militia, George H. Cleveland, Captain, to-day celebrated its 45th anniversary by a street parade, target shoot and a banquet. The Massachusetts militia target; 4ft. wide and 6ft. high was used; Springfield rifle, shooting off-hand, distance 200yds. There was a light wind most of the time. The individual score of each man in the order they shot was as follows:

2d Lieut Wm D Preston	33431—17	George Barrett	33043—13
Musician Sweet	34234—16	Arthur Merritt	52032—13
Sergt F S Hoyt	00223— 7	Alonzo Hoyle	20004— 6
Sergt J R Cleveland	33033—11	John McIntosh	30422—11
Sergt F L Townsend	05034—12	John Lauder	03003— 6
1st A Condly	00023— 5	Henry Bradly	34442—17
Corp A D Jefferson	44453—20	Capt G H Cleveland	35404—16
J M Johnson	43324—17	Edward Knight	00000— 0
Chas Sharples	43344—18	A H Fogarty	22333—13
Chas Perry	44440—15	R W Tainter	32023—10
E L Donovan	00302— 5	John Scully	43433—17
Sergt A E Brown	04343—14	Frank Reilly	22002— 9
C M Fogarty	44333—17	J W Lepire	35440—16
Geo Lawrence	23340—12	Walter Carrico	33043—13
Geo Moseman	00033— 6	Wm Ballou	22420—10
Corp Frank Stewart	20005— 8	Albert Hayland	44334—18
Chas Flint	02003— 5	1st Lieut James Early	43343—17
Arthur Norton	00000— 0	S N Bellows	40444—16
William Potter	30342—12		

There was also shooting by honorary members, composed largely of past members of the company and by representative of the press, also by Gen. Nat Wales, who commands the First Brigade, of which the Second Regiment is a part. His score was 44444. Among the guests present at the banquet were Gen. Charles Devens, an Associate Justice of the Supreme Court; Gen. A. B. R. Sprague, Sheriff of Worcester county; Hon. Charles G. Reed, Mayor of Worcester; Col. E. J. Russell, of Governor Robinson's staff; Major E. R. Shumway, of the Second Regiment, a former captain of the City Guards; Capt. E. A. Harris and Lieuts. W. E. Tarbell and J. E. Lancaster, of the Worcester Light Infantry, Co. C, Second Regiment; Capt. Fred W. Wellington, Lieuts. H. E. Smith and C. H. Bigelow, and Surgeon Gifford, of Battery B; Col. W. S. B. Hopkins, of the Worcester Continentals; W. L. Robinson, Commander of George H. Ward Post No. 10, G. A. R., Department of Massachusetts, and Frank P. Goulding, City Solicitor of Worcester.

The prizes were awarded as follows: First, the company's gold medal, to be held one year, also a silver badge, to Corporal A. D. Jefferson; second, a silver badge, to Charles Sharples; third, a silk umbrella, to Albert Wayland; fourth, a gold scarf pin, the gift of Gen. Wales, to Lieut. W. D. Preston; fifth, a mantle clock, to Joseph M. Johnson; sixth, an order for a hat, to Lieut. James Early; seventh, a pair of sleeve buttons, to John Scollay; eighth, a pocket knife, to J. M. Fogarty; ninth, a leather medal, to John Keileby. Prizes were awarded to honorary members as follows: First, a wicker chair, to Capt. E. A. Wood, score 18; second, a walking cane, to A. D. Puffer, score 16; third, a leather medal, to Lieut. Geo. Burr, score 2; special prize, a pair of opera glasses to a representative of the press, to John McGuire, of the *News*, score 9.

FITCHBURG, Mass., Oct. 2.—The teams of the Fitchburg and Leominster rifle clubs had a friendly match this week, the shooting was off-hand, distance 200yds., each man had 30 shots, the American decimal target being used. The totals of each man and club was as follows:

Leominster.		Fitchburg.	
B M Pitts	228	A B Small	246
E M Rockwell	225	C H Brown	225
Geo W Foster	220	E N Cook	206
C A Joslin	211	F H Rideout	187
F A Whitney	205	E M Rogers	182
	1,089		1,049

The annual target shoot of the Washington Guards, Company D, Sixth Regiment, Massachusetts Militia, also occurred this week. The best score was by Corp. Martin Mannix, 15 out of a possible 25, and he was awarded the first prize, a gold medal. The next best score was first secured by Sergt. J. H. Shea and Pvt. John F. Rourke, it was shot off and Shea made 18 and was awarded the second prize of $4. The three who were tie on the contest for the leather medal did not care to shoot for the prize. The evening of the day was devoted to a ball, which was very enjoyable.

GARDNER, Mass., Oct. 2.—Members of the Heywood Guards, Company F, Second Regiment, Massachusetts Militia, have met twice this week at the Hackmatack Range of the Gardner Rifle Club. They were practicing for the State rifle match at the muster field of the State militia next week. The work of the men on the two occasions was as follows:

	First.	Second.	First.	Second.
Private Hinds	22	—	Sergt Black	18	28
Private Taylor	22	19	Private Thrasher	18	—
Private Bishop	21	28	Sergt Wood	18	—
Captain Chamberlain	21	28	Private Carr	18	28
Lieut Edgell	20	23	Musician Gracey	18	—

BOSTON, Oct. 3.—To-day's shoot at Walnut Hill was poorly attended on account of the stormy weather. The matches were not opened, with one exception. Next Thursday, Friday and Saturday the fall meeting of the M. R. A. occurs, and a large list of prizes is offered for all comers to compete for.

Practice Match.

C B Edwards	4	5	4	4	5	5	5	5	4	4	—45

Griffey	1111112111—10	Strawn	1001121111—8
Still	1111111110—10	Williams	1011011121—8
Smith	1111111111—10	Gaines	0101121210—7

Budd, Griffey, Still and Smith divide first, Stice second, Carter and Strawn third.

No. 2—5 pairs double birds, 18yds.: Stice 10, Carter 9, Fahnestock 7, Fields 9, Lyman 8, Griffey 7, Rinkel 7, Card 9, Still 8, Williams 7, Hayden 9, Pettker 6, Wilson 7, Gates 7, Strawn 8, Hopkins 6, Schaaf 7. Ties: Stice first; Fields and Card second; Lyman and Strawn third; Griffey fourth.

No. 3—10 globe flights, 21yds.: Schaaf 7, Baugh 7, Wilson 10, Rinkle 4, Griffey 9, Jones 8, Gregg 8, Powers 7, Reuss 6, Stief 9, Bragg 5, Voight 7, Smith 8, Reuss 10, Stice 9, Fields 8, Gaines 9, Allen 6, Strawn 10, Judy 6, Williams 7, Carter 8, Budd 9, Loerke 6, Reed 7, Fahnestock 8, Card w., Hughes 9, Crosby 8, Hayden 7, Gates 6, Hopkins 8, Hassfurther 8, Meyer 9, Horner 10, Gibbons 5. Wilson, A. Reuss, Strawn and Horner divided first, Griffey, Stice and Gaines second, L. L. Carter and Hassfurther third, Powers fourth.

No. 4—7 blackbirds, 21yds.: Stice 7, Carter 7, Griffey 5, Woods 4, Reuss 6, Williams 5, Still 6, Corsby 7, Powers 6, Reed 4, Wilson 6, Jones 5, Baugh 6, Schaaf 6, Fields 5, Pettker 5, Sieminski 5, Hughes 4, Budd 7. Stice first, Reuss and Baugh second, Pettker third.

No. 5—2 pairs live birds, 21yds.: Stice 14, Card 15, Fields 14, Gates 11, Rinkle 14, Carter 15, Lyman 10, Gibbons 10, Williams 12. Card and Carter divided first, Stice and Rinkle divided second, Williams third.

No. 6—10 blackbirds, 18yds.: Carter 10, F. L. Reuss 9, O. B. Still 8, A. C. Ruess 9, Stice 10, Budd 8, Crosby 10, Fahnstock 7, Smith 10, Woods 9, Griffey 8. Stice and Smith first, F. L. Reuss second, O. B. Still and Griffey third.

No. 5—10 clay-pigeons, 18yds.: Carter 9, Stice 10, Williams 4, Horner 8, Baugh 9, Reuss 6, Hassfurther 8, Crosby 7, Budd 8, Jones 6, Nagel 4, Meyer 7, Gibbons 4, Griesedeck 5, Pettker 4, Hayden and Smith withdrew.

NEWARK, O.—The McIntyre Gun Club of Zanesville, the Licking Gun Club of Newark, and the Sherman Gun Club of Columbus had a friendly match at clay birds on the grounds of the Licking Club on the 25th of September. The match was shot from 5 traps, 5yds. apart, 18yds. rise, National rules governing. The Sherman Club was the winner by a small margin. The shooting was very close throughout, none of the clubs having at any time during the contest any decided lead. The day was perfect and a large crowd was in attendance. The full score follows:

Sherman Gun Club.

S. H. Brown	1111011100111111011	10	11	10	10	10—22

SPARROWS AT THE TRAP.—The English sparrows used at the trap in the late tournament at Indianapolis gave the greatest satisfaction. At first shooters looked only at the pigeons on hand, but on the last day they took to the Englishmen and did not leave them until the last was killed. Out of 500 sparrows not one was an incomer, and all but two sprung from the trap on opening. Scarcely a bird was challenged, as the little fellows require straight holding by the shooter, and at once show signs of lead if struck.

MIDDLETOWN, New York, Sept. 24.—Match held under the auspices of the Middletown Gun Club, 15 glass balls, 21 and 24yds. rise, rotary screened trap, first prize a Colt's lightning repeating rifle, second prize a squirrel rifle, third prize a hunting coat. T. A. Weller 5, J. Gunther 5, C. Bachelier 11, W. R. Stewart 11, F. Hulse 10, G. W. Hunter 2, Wes Decker 7, Maj. C. B. Wood 7, A. Wengenroth 10, W. H. VanWinkle 9, C. H. Winfield, Jr. 6, J. Jacock 6, R. J. Clark 10, C. H. Seymour 11, G. W. Knight 9, W. H. Buchanan 6, C. H. Worcester 12, B. Bachelier 13, G. W. Case 14, S. Washer 14, V. Green 10, C. S. Miller 12, W. H. Crawford 10. Tie on first won by G. W. Case. B. Bachelier took second, and C. H. Worcester third. The match was a success in every respect. We have a flourishing club, club house, grounds and rifle range, and shoot practice matches every Thursday.—W., JR.

CAMDEN GUN CLUB.—Camden, N. J., Oct. 5.—Sixth and final match for gold medal that has been offered for the past two years to the member winning it three times. It now becomes a permanent and useful fixture to Mr. Simon's watch chain, and, as yesterday's score indicates, he has earned it. Match at 10 pairs globe flights, 7 Ligowsky screened traps, 4th notch, 18yds.

"SMALL YACHTS."

SMALL YACHTS: Their Design and Construction Exemplified by the Ruling Types of Modern Practice, by C. P. Kunhardt.

IT IS unnecessary to introduce the author of the new volume entitled "Small Yachts." Probably no person is so widely known in connection with all that relates to the improvement of yachting affairs at home and abroad. In every nook and cranny the world over, wherever yacht or boat can float, the author's name has become a household word, and his labors have been cherished as gospel from the true fountain head. No one has wielded a wider influence or exercised more potential sway over the yachting interests of this continent. It is not too much to say that in obedience to the exceptional force and logical acumen of Mr. Kunhardt's prolific pen, added to an especial fitness in his chosen field, the aspect of yachting in America has undergone more radical transformation than all other causes combined have effected. Not merely was he the chief instrument in furthering the numerous modifications which model and rig have been put through during the past five or six years, but the healthier methods of pursuing the sport and much of the existing enlightenment upon all that bears upon amateur sailing, is directly traceable to his earnest and untiring work in behalf of the elevation of yachts and yachtsmen in our waters. So emphatically was his personality impressed upon the community at large that even his very words and phrases have since been enerafted, part and parcel, upon the yachting literature and gossip of the day. Scarce a paragraph appears in contemporaneous publications but the plumes borrowed from the original and incisive pen of the author of "Small Yachts" can be readily detected. From a source which had shown the capacity to nurse a "cutter boom" successfully through the tribulations of an inauspicious birth to the climax of an international trial and the permanent habitation of a large fleet of cutters in American waters, the public naturally looks for something out of the common in the new volume "Small Yachts." In this expectation they are not likely to be disappointed.

Though portions of the technical ground gone over in "Small Yachts" are not of the author's invention, he has contrived to relate in an attractive, popular, but accurate and comprehensive form that which in other works on naval architecture is apt to repel the student as tedious and involved beyond reason Moreover, the one and all-important point to the student, the practical application of the lessons set forth, has ever been kept uppermost throughout the whole volume. Indeed, the useful side of the teachings of naval architecture make up the burden of the first division of the book. Not in a single page does the author steer astray into the purely theoretical field. On the contrary, theory is dealt with only to the extent to which it can subserve the practical side of designing, and all which is purely inferential or speculative in character has been purposely thrown overboard as foreign to the subject matter and more likely to mislead than instruct. In "Small Yachts" we have a volume which is neat from beginning to end, brimful of information, of data, of sound counsel, and totally free from "padding" with irrelevant material and the chimerical theorizing so constantly reiterated in similar works without purpose, other than to support a claim to "scientific" attainments.

While strictly impartial in the record of established facts, "Small Yachts" is the reverse from dreary reading. The technical chapters can be taken up by any one with a smattering of boat knowledge and perused without break or halt, owing to the happy faculty the author has of imparting even intricate subjects in fluent composition spiced with a breezy dash, holding the reader's interest and leading him along in logical sequence from topic to topic in little mental skips. It has been truly remarked that the book "reads like a novel—you never know when to leave off."

Personal experience in all the details of modeling and designing enable the author to impart to the beginner the fullest instructions in the manipulation of the tools and the processes to be gone through in scheming out a vessel in wood or upon paper. To this the leading chapters are devoted. Not the least instructive are the opening pages in which the special sphere of both model and draft are insisted upon and supported by good argument. After accompanying the student through the draftsman's office with specific caution on all points likely to harrass the beginner, the actual plotting of the "three plans" of a yacht is undertaken, the sloop Schemer, well-known in racing annals, serving in explanation and also in exemplification of light draft construction. As the three plans are in general use for representing the form of a vessel, eight pages are taken up in their discussion, and it is safe to say that they elucidate the meaning and object of the various lines in their relations to one another more clearly and comprehensively than anything of the kind yet published. Following this the plans are taken up represented physically in the block, together with the opportunities afforded for experiment, and the weight to be invested in the comparisons instituted. The summary of this chapter is a key to the motive which has actuated the author throughout the book. Not merely are sundry disjointed observations related, but their relative value for practical purposes has been assigned to the separate deductions, to forestall erroneous conclusions by the review of everything in connected action. The line is distinctly drawn between tank experiments upon models subjected to tests of certain qualities one by one, and between complete physical reproductions of sailing yachts on a small scale, the former being condemned as illusive and the latter supported with the clear insight which has always given the author's writings much weight. "Taking off," the reverse of the process of laying down a vessel's lines, receives attention in a special chapter. The yacht operated upon is the Nuckel, a German keel sloop, peculiar in many respects, and interesting in itself from a designer's point of view. This chapter will serve to further familiarize the reader with the relation of the three plans to one another and enables him to ascertain the form of a boat hauled out upon the beach. This brings the book up to the second division, which is devoted to a consideration of the elements governing performance.

The causes of resistance are set forth in such a plain manner that all the untenable "beliefs" and vagaries hitherto current in the building profession must give way to a true appreciation of the subject. The various causes adduced are supported by citations from experience, with which every one is familiar, and the well-attested fact that large displacement or heavy weight and great draft may be driven with less expenditure of power than lighter, shoaler forms, will no longer appear paradoxical. The extent to which beam may be clipped and depth increased without loss in speed is of special application, now that the matter of large or small beam has become such a prominent issue in match sailing. A study of this chapter alone will be of great profit in freeing the builder from old-time antipathy to vessels of safe and wholesome form, and open the way to an abler class of yacht than the typical sandbagger on a large scale.

The following two chapters comprise a review of displacement and stability, both written to be understood even by hasty reading. It is not long ago that a bold individual offered to wager $1,000 that he could capsize any cutter in the harbor, and that he could see no difference between cutter and sloop in that respect. Probably a casual glance at the chapter on stability will make the challenger a trifle more conservative in the sum he proposes to stake. Although stability is dwelt upon at length in all works on naval architecture, the method of presenting and dissecting the subject is novel in "Small Yachts." It is agreeable reading and comprehended almost without effort at thought.

Twenty-eight pages are replete with the description of recognized rigs and the principles of propulsion. Innumerable points crop up which the author takes in hand in connected description, giving precedence to practically ascertained facts over theoretical inference and loose talk, as in all other portions of the book. The fifth element considered is beam in its relations to the yacht as a whole. This chapter is one of the most valuable and instructive in the volume. It deals directly with the "battles of the types" brought into such relief in recent years through the author's writings in FOREST AND STREAM and other periodicals. It contains in terse, precise language the pith of design, so far as it is affected by beam. The leading paragraphs will serve to show the stand taken in "Small Yachts." They run as follows:

"Few elements of design are properly to be estimated in their individual capacity, but only in their relation to others and to the vessel as a whole. Meaningless and illusive deductions commonly arise from neglecting the qualifying influence of attending characteristics."

"The most prolific source of popular fallacies is to be traced to a ceaseless search for the 'best proportion of beam to the length,' a hunt which it is needless to say will ever be futile."

"No proportion of beam to length can be singled out as 'the best,' for that hinges upon the *concurrent displacement*. An amount of beam perfectly admissible and contributing to highest performance in one style of boat would, in another style, be inviting palpable failure."

"While 'beam to length' is devoid of significance, 'beam to displacement' is really the controlling cue, where design as a whole is referred to length as the initial, and where performance is the issue."

The foregoing quotations with the arguments in support in the rest of the chapter not only represent the main features of design in an entirely new light, but would be difficult to disprove, now that we have witnessed the very highest speed in the best examples of extreme breadth, as in many of our orthodox centerboard sloops, in boats of moderate beam as in the Puritan, also in boats of the narrowest midship mould ever sailed, as in the fast cutter Clara. In the light of events, all in "Small Yachts" that seems at first glance a startling departure from faiths once accepted, can be substantiated through the test of experience, and this gives to the volume an influence with the reader not derived from other works which fail to unite theory and practice on common ground.

Balance and its object, and handiness occupy several pages each, and then we come to a review of centerboard and keel. This will prove live reading. Its composition, while delightfully combative, displays such accurate process of reasoning, such well balanced thought, and so much that is instructive, that the student will regret its termination and wish there were more of the same kind. So much nonsense and so much fable is current about the assumed superiority of the centerboard as a direct contributor to speed that a chapter covering the hoary question of centerboard vs. keel deserved a prominent place in a book intended to disseminate accurate knowledge and dispel the wordy quackery of superficial observation. We feel certain that after digesting the case as presented by Mr. Kunhardt, the student will rise with the cobwebs effectually cleared from his mental vision for all time. A vast amount of ink has been spilled in a desultory way anent this very matter, but without reaching nearer the end than we were in the beginning, yet five short pages in "Small Yachts" suffice to shed light where darkness has so long prevailed, and once for all remove the so-called "question" from further discussion. The force of the author's logic is challenging, and it would take an adept to meet him, if indeed an adept could be found to take exception to direct evidence from experience which is indisputable.

We shall now give the book in a general way, but in turning over its leaves find so much pith and so much point in almost every line that nothing short of this can do the publication justice. Design in its unity, the next chapter, is a characteristic summary of the disposition of bulk and rounds up with a dissection of the various theoretical "systems," upon which the author places little store in comparison with more primary and influential essentials. Six pages cover the actual "Computations," they being of subordinate value, according to Mr. K., and spliced into the body of the book for the benefit of those who delight to "juggle with figgers." The second grand division of the book winds up with a chapter entitled "Theory and Practice Compared." This may be termed a regular "rouser." It starts in with vim and is carried along with considerable animation. It is an arrangement of theory, of naval architecture in figures, as it is preached in the litterature given over to an assumption of knowledge which lamentably fails when applied to the wants of the profession in practice. We, in America, of all nations, pick practice in preference to theory and the American constituency will indorse the author in the stand he has taken, though from abroad the chapter may "call down derision from high quarters." This is, however, met in advance by the systematic refutation of the claims of naval architecture as a guide to the inception of design, and it is difficult to see how even the "highest quarters" can invalidate the author's argument on up the contrary on a firm footing.

The third division of "Small Yachts" comprises an array of examples of all types, systematically arranged according to their chief features, such as catboats, keel catboats, jib and mainsails, centerboard sloops, keel sloops of deep and light draft, cutters of large, moderate and small beam and a variety of craft of special build. Two or more examples are provided in each case, with full description and data in the text and illustrated in about seventy plates bound in the rear. One hundred and sixty pages are filled in this manner. Each yacht is dealt with separately, her points and performance examined, and advice given for alterations where desirable. The plates are executed in higher styles of art than anything of the kind yet published and show the author to be an accomplished draftsman and artist. A vast amount of detail information is to be gleaned from the plates, while explanatory diagrams and illustrations abound throughout the volume. Ironwork, lead of gear, construction, cabin accommodations and equipment are among the things the plates will disclose. Those fond of sailing in small yachts by themselves will be pleased with the very comprehensive treatment of their hobby in a series of articles on the models, rig, outfit and management of singlehand yachts. Directions for fitting out, laying up, the keep and care of yachts, boat building for amateurs, yachts' boats, yacht clubs, racing rules, official papers, etc., are grouped in a fifth general division and an appendix is added with the new rules of the road, a bibliography, etc.

The volume is printed on elegant gloss finished paper, handsomely bound, and in its mechanical features makes a most agreeable display.

HIKERS ON THE DELAWARE.

THE "hiker" is an aquatic racehorse, not more than 15ft. long, without a deck, with a mast away up in the bow, and with a single sail big enough for a good-sized yacht. The "hiker" does not carry any ballast except that which can move about on two legs. In other words, her crew of four or five men are her ballast. In order to utilize their weight so as to prevent capsizing, the unknown genius who invented the "hiker" devised the following scheme: Fastened to the centerboard, the mast and the lower yard of the sail are five or six ropes, which are long enough to hang over one side into the water. On the ends which go over the side are fastened bars of wood, and on these bars of wood hang the human ballast.

An admirable illustration of the working of this simple but rather moist device is afforded during every regatta of the Southwark Y. C. The Southwark is composed entirely of "hikers," either with a double or a single bow. When the starting gun is fired, from thirty to fifty racers dip across the line as their crews frantically haul up the sails. They continue hauling until such a spread of canvas is displayed that any spectator who was not acquainted with the use of the apparently useless ropes and wooden bars, which seem to be only in the way of the men, would say at once that the unballasted little boats would go over before the first quarter-mile was finished.

On they glide down the river, gathering increased momentum with each moment. Still their progress is comparatively slow, there being but a breath of air. The crews all sit staring at the sail and at the river behind. Suddenly the ruffling of the water tells of the coming of a puff of wind. The crew of each "hiker" scramble over to the windward side and perch themselves on the gunwales with the bars of wood in their hands. Perhaps the wind blows steadily—perhaps it strikes them in a gust. If the former, then the men sit where they are, balancing the craft simply by their all being on one side. But if, especially while tacking, the "hiker's" spread of canvas above proves too much for her and she plunges over, the captain yells frantically "hike over."

In an instant the ropes are stretched taut and the wooden bars disappear overboard into the water, followed by the men or the posterior part of them. Only their legs remain in the boat as they sit on the transverse bars and hold on to the ropes. Every other wave surges up to their necks, and often a dip to windward submerges them completely, with the exception of their legs, which flourish wildly up over the side of the boat, but when they reappear again the craft has been saved from capsizing by this sudden hanging out of from 800 to over 1,000 pounds on the windward side. Sometimes an entire tack across the river is made with the crew "hiking out" in this manner.

Sometimes, as they come about, in spite of their efforts, the wind proves too strong for them and the side they are sitting over is raised high up into the air. Then for a few brief seconds every nerve is strained as they pull on the ropes and hang, almost head downward, over the side. They may succeed and keep the boat from capsizing, or they may all execute a grand flying leap as the "hiker" goes over and they are thrown forward into the sail. This, however, happens only when there is an unusually strong wind or when bad management is shown in "coming about" at the wrong time. And, even if they do capsize, there is no harm done. Of course they are out of the race, but that is all. The tugs and steamers that follow pick them up and tow the half submerged boat back home again, where she is righted and bailed out.

On many of the races at least ten men are taken in each boat. They serve to keep her steady as long as the breeze is too stiff or the cruise is against the wind. But if, after the buoy is rounded and the wind dies away, the captain glances significantly at one of the crew, the yachtsman grins, pulls off his boots, and drops overboard. Perhaps he is picked up, perhaps he is not noticed in the excitement of the race, and left to take care of himself. In this case he calmly strikes out for the shore, half a mile away. Sometimes half a dozen men are dropped over in this manner from one boat, in order to lighten her and keep her rivals from crawling ahead. But woe to the captain who sacrifices too many of his men. There may come up an unforeseen wind and bowl over the too-lightly ballasted boat in the twinkling of an eye.—*Philadelphia Press.*

SLOOP OR CUTTER?

Editor Forest and Stream:

As the yachting season closes and the excitement of the international races diminishes, I think that in order to determine the amount of glory attached to the victory and the advancement made in yacht achitecture that a comparison of the present with the past defenders of the Cup would not be out of place. Everything about the defenders of the Cup up to the present one seems to be entirely original and thoroughly American. Commencing with the America down to the Magic, Columbia, Sappho, Madeleine and Mischief, not in any particular do they show a point of English origin. How is it with the present one? What has become of the principles maintained by Vixen and Shadow that we should surrender all we claim without a contest? The sloop advocates are welcome to all the consolation they derive from the victory of the cutter over the cutter, as the sloop had nothing to do with it; and it must have been gratifying to the cutter men when the Puritan was selected as a contestant, inasmuch as no greater backdown could have been committed by the sloop advocates. The Genesta fails to carry off the Cup, but she succeeds in sustaining her side of the argument and being in with the Puritan at the demise of the American sloop. LOYALTY.

Editor Forest and Stream:

I have just read Mr. Clapham's letter in your issue of the 10th inst., in which he ridicules the idea of Puritan being a cutter or having anything in common with that British monstrosity except outside lead and a long counter, and dogmatically pronounces her a sloop pure and simple. May I be allowed to ask Mr. Clapham through the medium of your columns what are the points which constitute the difference between the two other than the rig (for even he cannot but allow that in that respect Puritan is a cutter and nothing but a cutter)? Is it the possession of a centerboard, or is it the relative proportions of length, breadth and depth, displacement and tonnage? If the latter I am curious to know what he would have called the old Bucaneer. She was built in 1867, and for three or four years was cock of the walk, and did pretty much as she pleased in the 15-ton class until the gradual increase in length, lead and depth snuffed her out. Now we in our ignorance had always deemed her a cutter, and she was so called and classed, but doubtless Mr. Clapham can set us right on that point and give us her correct designation. Here are her dimensions: Length on L. W. L. 33ft. 9in., beam 10ft, 4in., depth from W. L. to rabbet line on keel considerably under 4ft. She had not a centerboard, but a deep fixed keel very much cambered, and her fore foot well rounded up. She had 1 ton 10 cwt. of lead on her keel, the remainder of her ballast (lead) was inside, making a total of 6 tons for a craft of 14 tons T. M. and 12 tons displacement. These proportionate dimensions would surely, therefore, qualify her to take her place in the ranks of the sloops even more than do Puritan's, particularly in the matter of ballast, as her outside lead was less than a fifth of her total, while Puritan's is considerably over half. Now, sir, being always anxious to call things by their right names, perhaps Mr. Clapham will kindly enlighten me and set my mind at rest as to which type the old boat really belonged. Was she sloop or was she cutter? If the former I shall always in the future when referring to a little ship of whose exploits I am naturally rather proud, speak of her with much deference as my old sloop the Bucaneer.

HENRY E. BAYLY.

EXMOUTH, England, Sept. 22, 1885.

THE SONG OF THE AMERICA.

THE following song appeared in an English paper shortly after the victory of the America in 1851. We have never seen it in print, though it was once well known here. We are indebted for the following version to Mr. R. K. McMurray, Brooklyn Y. C. to whom it was dictated from memory by Mr. Lester Schofield, Chief Engineer of the Mallory Line:

Come listen to my ditty, a song to you I'll sing
Of four and twenty yachting boys all anchored in a ring.
It was the Royal Yachting Club, the Queen of England's pride,
And pride of all the yachting men that ever hailed from Ryde.

CHORUS—"Where did she come from?"
"New York town."
"Who's her skipper?"
"Old Dick Brown."

It happened on a morning as the sun was shining bright,
A modest looking schooner came wing and wing in sight.
Whence came she or what was she no one of them could say,
For no one thought so small a craft came from America.

Then on she came as lightly as bird upon the wing,
And rounding to so noiselessly, cast anchor in that ring.
Her stern presents an eagle, spread from starboard side to port,
And that's the only ornament she wore of any sort.

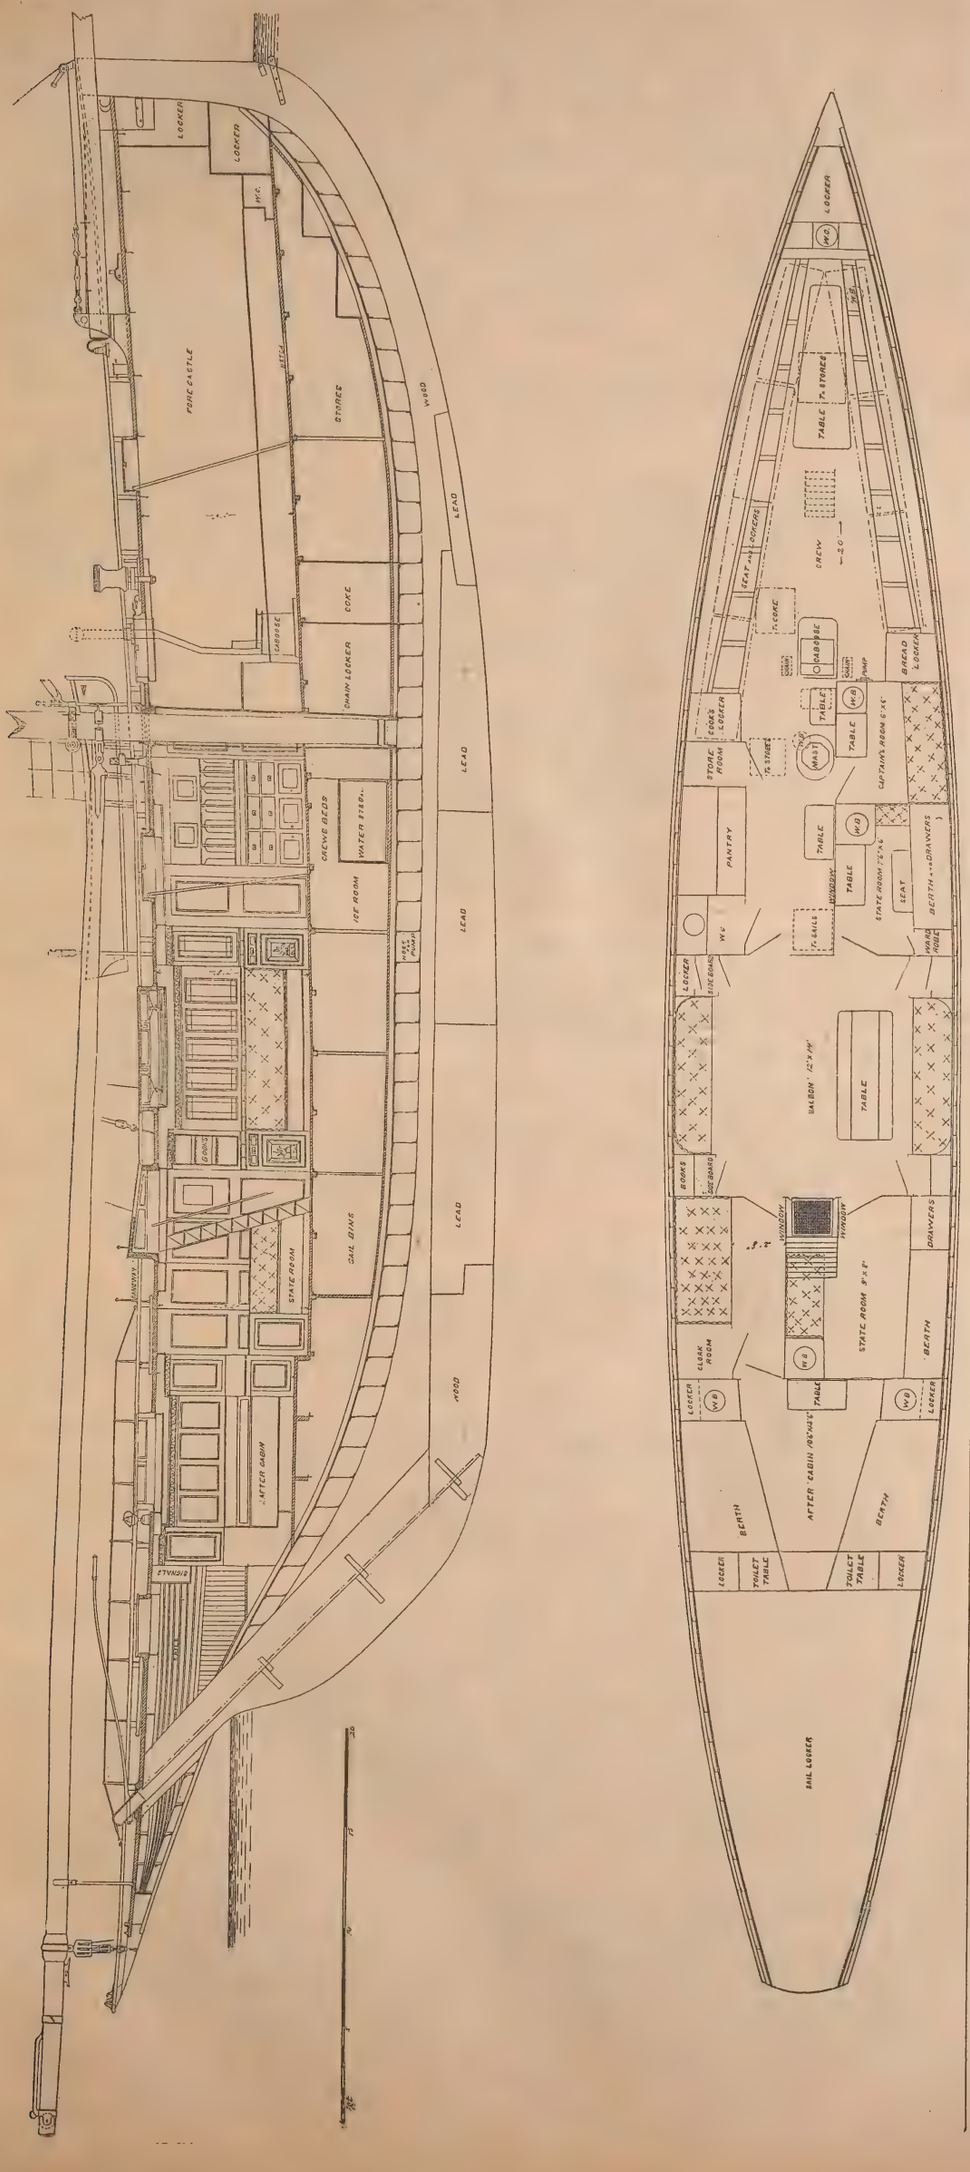
'Twas then the Royal Yacht Club began to smell a rat.
Some thought she was some pumpkins, some thought her more than that.
But interchange of visits soon made it clear as day
That she was brother Jonathan's own America.

Then next our worthy Commodore a challenge did indite,
A challenge frank and bold and fair as any man could write.
He told the noble Wilton he would race his Yankee yacht
Against schooners, cutters, steamers, of the size he cared not what.

The regatta being open to the yachts of all creation
And we the only Yankee yacht to represent the nation;
We entered against fifty royal racers round the Nab,
And beat the best as easy as a dolphin beats a crab.

This touched the ire of good John Bull and raised his native pride
Said he, "I'll bet 500 pounds I'll find a boat at Ryde,
In sailing twenty miles and back will beat the Yankee Doodle,
Or I will freely tell the world that I'm a beaten noodle."

Now the yachting season's over and we've all had lots of fun,
The prizes are all handed to the victors who have won.
Victoria frankly gave us her heartiest approbation,
Allowing that when Yankees wished they could beat all creation.



The good old tars of England looked on with sad surprise,
While others not so highly pleased all damned their blessed eyes,
The ladies pass and kiss their hands in token of adieu
While all the roosters in the coops crowed Yankee Doodle Doo.

DORCHESTER Y. C.—The ninety-second regatta of the Dorchester Y. C. was sailed on Saturday last, the final race for the Barnard Cup for catboats. Only four boats sailed, the day being foggy up to the time of the race. As Queen Mab and Flora Lee each had a leg previously the cups were awarded to them. This closes the club's season. The times were:

	Length.	Actual.	Corrected.
FIRST CLASS.			
Queen Mab, Burwell and Litchfield	22.03	1 17 33	0 51 06
Niobe, J. R. Chadwick	20.01	1 20 03	0 51 20
SECOND CLASS.			
Flora Lee, D. H. Lincoln	16 09	1 25 37	0 52 46
Mirage, S. G. King	17.05	1 27 36	0 55 39

PHOTOGRAPHS OF GENESTA AND PURITAN.—We have received from Pach the photographer two handsome photos of Genesta and Puritan out of water, showing the entire forms of the boats. They can be had at 841 Broadway, New York, price 50 cents each. Mr. N. L. Stebbins, of Boston, has in press a list of views of the racers and many other yachts, which will be ready soon.

THE RACERS.—Priscilla has been hauled up at Harlan & Hollingworth's and stripped for the winter. She will be altered materially before next season. Puritan is now housed over at Beverley, and her crew have left her. Genesta shipped her short mast and bowsprit on Monday for her return trip.

GENESTA.

GENESTA'S voyage across the Atlantic and her subsequent performance here have shown very plainly her excellence in two important respects—first, as a safe and speedy seagoing cruiser, and secondly, as a racer superior in speed to all American yachts save one, and practically equal to that one. Under an easy seagoing rig and with no attempt to drive her she made the western passage in 22 days, or less than the time made by Cambria and Dauntless in their famous race. Such a passage made safely and quickly by a little boat only 81ft. long fully proves the seagoing powers of this type, and specially of Genesta, and since then we have had further proof in the Brenton's Reef race, when she came through some heavy weather at racing speed under her big mainsail.

Her claims as a fast racer in ordinary weather are placed beyond question by her races here. Though beaten twice by Puritan, a boat confessedly far ahead of all others, it has been by a small margin, only 1½min. in the better of the two races. The only other boats that have cared to face her—Dauntless, Grayling, Fortuna and Gracie—have been very badly beaten in all the races; and Genesta returns with substantial evidences of her superiority over all American yachts save one. In these two characters—as a seagoing cruiser and a fast racer—she is known to all who have followed her record in the papers for the past summer; but there is a third point, hardly less important than the other two, which is known only to the few who have been on board of her, but which is clearly shown in the accompanying plans, for which we are indebted to her designer, Mr. J. Beavor-Webb.

That she is not merely a racing machine, but in every sense a yacht, is well shown by the fact that for three months she has been the home of twenty-five men who have lived, eaten and slept on board continually in spite of the work and confusion of hard racing. The service required of the average American yacht of like size is one thing, there must be room for afternoon sailing parties from New York or Newport, some place where a crew can be stowed away, a place for a big galley, and sleeping space for owner and guests, frequently with most of them berthed on sofas in one cabin; but how many of them are fitted to give room for a score or more of men for a length of time, with space for stores, water, coal, and other requisites? On Genesta all this is done, in what manner is shown in the two plans. In the wide boat there is but one level, all is on one floor so to speak, only water tanks and chains being under the cabins, while sails, stores, luggage, ice, coal and similar articles needed on a long cruise, are stowed in the wings or in odd corners, as best they may be. The modern cutter, on the contrary, is arranged on an entirely different plan. Instead of one there are two levels or stories; one, the main portion, being only the living space of the owner, guests and crew; the other, out of the way and hidden from the casual observer, being a separate storage space for everything not in constant use. Two main ends must be kept in view by the designer, to provide pleasant and comfortable quarters for the owner and his friends, a floating home perhaps for months, and also to accommodate the large crew required in racing, giving them roomy and airy quarters. The steward's department also demands considerable space, as it is no small matter to care for the wants of twenty five or thirty men with salt air appetites.

In a small cutter, a 5 or 10-tonner, of modern type, narrow beam means literally an extreme breadth of 5 to 7ft., or in the case of a ½-tonner, not much more than 4ft. breadth inside the cabin, which, in spite of the accompanying advantages of length and headroom, is really a very small space measured by the true unit of size, the average man. "Narrow beam," however, is relative, not absolute, and the proportions of a Chittywee or Currytush, when expanded to a 90-tonner, not only give plenty of space, but give it in the shape that is most valuable to the architect. Though still a 5½ or 6-beam boat, the 90 has a width of 15ft., which gives a saloon over 14ft. wide inside, with a corresponding length, while the deck area is proportionately large compared with our unit, the height of an average man, or more properly the space which a man requires to move freely. Looked at end on or from above, the boat is ridiculously narrow, standing on deck there is a breadth of six paces from rail to rail. Bulk for bulk, the narrow boat offers to the architect facilities for an economic arrangement of space that no wide models can. In the former the space is in the shape of a long, deep block, readily divided in large and small rooms with the least possible waste from the curved character of the planes that bound it. From apron to archboard, from keelson to deck, the space may be subdivided without waste. In the wide, shoal boat on the contrary, even supposing the cubical contents to be the same, the central part of the boat is divided into several rooms of greater or less size, necessarily with little height in a vessel of less than 100ft. waterline, while in the ends, the wings on each side, and under the floor is a large amount of space divided into small triangular compartments, many of which are of no use, being inaccessible, while the best of them badly fill their purpose. Added to this is the centerboard trunk, monopolizing 15ft. of the best space in the boat, with an arbitrary bulkhead that cannot be pierced with doors or otherwise meddled with. It is firmly fixed, an intruder that is always present, occupying the space most essential to a proper arrangement, and dictating to the architect in unyielding terms.

In such a vessel as Genesta the space is in the most advantageous form and another benefit is gained from the me hod of construction, as the steel frames occupy little breadth and reduce the thickness of the sides.

Being a racing yacht, the crew's quarters must be very large, the total length of the forecastle being over 23ft. from the bulkhead aft to the locker at the fore end. In a cruising boat, or one that only raced half a dozen times in a season, this space would be cut down considerably, giving another stateroom. Going first to the owner's apartments, the companion opens directly into the main saloon, a room 14ft. wide, 12ft. long and 8ft. high, lighted and ventilated by two skylights. The walls are handsomely paneled with walnut and the two sofas upholstered with a dark material, the finish, as in all o her parts, being plain but elegant, hard woods tastefully combined, dark hangings and an entire absence of silk plush and jimcrack work. Both in the general plan and in the minor details nothing is neglected that would help to make a comfortable home of the yacht, but there is an absence of show and luxury that will at once commend itself to all true yachtsmen. On each side of the cabin is a large sofa, offering a bed if necessary, but the boat is so planned as to afford staterooms for all, the cabin being parlor and dining room only and not, as is often the case in the average sloop, converted into a dormitory at night as the only way of utilizing the space in the wings. At the head of each sofa is a sideboard with a small closet above. At the foot is a second sideboard, each having a drawer above it, as shown, and above this a bookcase, the shelves filled with modern works, mostly books of travel. A large swing table, always level, occupies the space in front of one, the sides hanging down when not in use. This room is used only as a parlor, library or dining room; no one sleeps there, no sails are stored there and it is always in order. Opening from it forward are two doors, one to port leading to the galley and men's quarters, and one to starboard leading to a stateroom 7½×6 ft. and as high as the saloon. This room is fitted with a berth with drawers underneath, a movable seat in front of the berth, a table, small sofa and a washstand, the latter with folding top, making a table when not in use, as do those in the other staterooms.

In the center of the after side of the saloon is the companion to the deck, the opening being closed with two half doors. At the front of the stairs is a grating leading to the lower hold and serving to ventilate it. On each side of the stairs is a window, one lighting the stateroom and one the passageway aft. On the starboard side of the stairs is a door opening into a stateroom 9x8ft., furnished with berth, drawers and toilet table, washbasin and sofa, the later partly under the stairs. On the port side of the stairs is a passageway 2ft. 8in. wide, leading to a large after cabin. On the side is a sofa and drawers, while next to it is a large closet for oilers and coats, a great convenience. The after cabin, 10½x13½ft., is fitted for two persons, there being a berth on each side with drawers under each. At the fore end is a washstand with closet above, and at the after end is a toilet table and closet. The room is large and well lighted and aired by a skylight on deck. At the side of the passageway was formerly a berth in place of a cloak room, but this, as well as a second berth, were removed some time since. The bathtubs are placed under the floor.

This completes the owner's quarters. Going forward by the door on the port side of the saloon, the next room is the steward's pantry. This is fitted up with a mess table for the officers just abaft the mast, and a large dresser for china and glassware. There is a hatch in the deck just abaft the mast, and one below it in the floor, the sails being passed up and down here without being taken through the saloon. Going on forward is a storeroom and cook's locker to port, and on the starboard side is the captain's room, 6ft. square and very neatly fitted up.

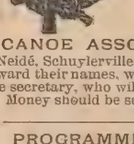
The forecastle is not only very large but is also high, the distance from floor to deck being 7½ft., and it is both light and airy, surpassing any of our largest American yachts. Plainly and neatly finished, it is kept scrupulously clean at all times. At the after end is the stove, a rather small affair, but fully equal, in skilled hands, to all requirements. Near it is the fresh water pump and bread locker. Along each side are lockers used as seats by day, and also for the crew's clothes, and above these at night the hammock beds are swung, as shown by dotted lines. Wash basins and other lockers are also provided, and at the extreme fore end is a large table. The fore hatch, just forward of the capstan, is a section of oval steel tube.

This finishes the living part of the ship, but there is still a large portion unvisited. Going aft on deck, first there is an oval hatch, opening into a large sail room in the counter, ceiled and divided into sail bins. Here are stored sails, lines, and other articles in frequent use on deck. Now going back to the forecastle, directly under the

forehatch is an opening in the floor, leading not into a confined and dirty bilge, but into a large space extending the entire length of the ship. Below the floor of this lower hold are the ballast spaces, between the iron floors, one of them being marked "hose for pump" in the drawing. What bilge water there is collects here, and the hold is kept dry and sweet. Forward are kept various stores and provisions; then there is a bin for coke, the chain lockers next to the foot of the mast, and abaft the latter is the fresh water tank, holding 378 gallons. Abreast of the tank are stowed each day the forecastle beds, thus getting them entirely out of the way. A hatch abreast the mast on port side gives access to the paint, gear by is the ice room and bin for vegetables, and still further aft are the sail bins where all extra canvas is carried. A hatch in the deck and one directly below in the floor gives access to the sail bins, which are ranged on each side of a central passage. Each sail in its bag is sent down and stowed in its proper place, and the saloon is kept entirely clear. All weighty articles, chain, watertanks, ice, etc., are stowed far below the waterline, where their weight does some good, and in the construction the upper works have been kept as light as is consistent with strength.

The keel, stem and sternpost are of wood, while the frame is of steel. The floors, angle frames and deck beams are shown in section. The inside ballast, only two tons, is stowed between the floors directly on top of the keel. Last winter ten tons of ballast were removed from inside, the lead shown in the present drawing was dropped 3in, and in this space, between it and the wood keel, the extra ten tons were placed, increasing the outside ballast to 70 tons.

On deck the fittings are no less perfect than below, the iron work being specially noticeable. The bowsprit ships in the center, the gammon iron and span shackle for forestay making one very neat forging. The heel of the bowsprit ships between strong but light wrought iron bitts, the starboard one being hinged to allow the heel to swing to one side in unshipping the bowsprit. To these bitts the forestay is set up with a double turnbuckle. The brass capstan is small and compact, but very powerful. The ironwork about the mast, the spidebands and gooseknecks for main and spinnaker booms all show the same care in design and workmanship that is evident in all parts of the ship.



Galatea, whom we shall probably see here next season, is similar to Genesta in model, but is 5ft. longer with the same beam and built entirely of steel. Her interior arrangements are somewhat different and her fittings are much more elaborate, as she is the home of Mrs. Henn, who always sails with her husband. Both yachts were designed by Mr. J. Beavor Webb, well known from the success of the 40-tonner Tara. Besides these three he has also designed a number of other yachts, large and small, Carmen and Medina, steamers, the little 5-tonner Freda, a fast 20 of the same name, a steam launch also a Freda, the Ventura, Medusa, Dandelion, Maggie, Whitewing, Partridge, Tern, Pulvia and many smaller yachts well known abroad.

Canoeing.

Address all communications to the Forest and Stream Publishing Co.

CANOEISTS *are invited to send us notes and full reports of cruises, club meets, information about canoeable waters, and other communications of interest.*

Secretaries of canoe clubs are requested to send to FOREST AND STREAM their addresses, with name, membership, signals, etc., of their clubs, and also notices in advance of meetings and races, and reports of the same. Canoeists and all interested in canoeing are requested to forward to FOREST AND STREAM their addresses, with logs of cruises, maps, and information concerning their local waters, drawings or descriptions of boats and fittings, and all items relating to the sport.

AMERICAN CANOE ASSOCIATION.

SECRETARY—Dr. C. A. Neidé, Schuylerville, N. Y. Candidates for membership must forward their names, with $2 for initiation fee and first year's dues, to the secretary, who will present names to the the executive committee. Money should be sent by *registered letter* or money order.

THE REGATTA PROGRAMME FOR 1886.

THE new Regatta Committee have begun work in good season for next year and are now busy with the race programme. The following letters contain some good suggestions, which are open for general discussion and commext as an aid to the committee in their work. The success of this year's programme, chiefly due to Mr. Gibson, adds weight to his suggestions given below. It is evident that the programme of regular races was too long, as any continued bad weather makes it difficult to carry it out. Mr. Gibson's plan for shortening it will meet the ideas of many, especially as if it should prove too short there are always extra prizes to be raced for. The best feature of it is that it calls for no change of the rules, which now seem to work perfectly in practice, the demand for even trifling changes being less each year. Thus far only one change has been suggested this season, an extension of the depth of keel, which we discuss in another place. The doubling up of the paddling races will be a decided advance, as it is now pretty well settled that the two leading sizes of canoes will be 28 and 30in.

It is fairly within the province of the Association to determine which are the proper sizes to encourage and to enact such arbitrary rules as may gradually exclude the odd sizes from the official programme, thus simplifying it greatly. Already the majority of boats will race very evenly in the 28 or 30in. class, and the few that will not can easily be accommodated with an extra race, for instance, of Rob Roys. The rights of all must be kept in mind, but still, at this date, the building of odd sizes must be restricted as much as possible. Builders are at last waking up to the importance of building to exact size and not selling a 29¼in. or 30¾ boat for a 30in. one, and canoeists must look to it in purchasing that their boats are of the guaranteed size. We all know that a 27¼in. boat or a 29in. boat is no better than a 28in. one, and it only means a little more care on the part of builders and users to secure a uniformity that will greatly simplify the rules and lessen the labors of the regatta committee and measurers. Two sailing, two paddling and one combined race are enough for the record, and any extra races can easily be arranged, as the time may make desirable. The annual races now are of interest to all canoeists, whether they take part in them or not, and they serve to a great extent as models for club regattas, so it is desirable to make them as perfect as possible and to this end we will be glad to publish any comments or suggestions calculated to aid the committee.

Editor Forest and Stream:

Inclosed I hand you a letter from Mr. R. W. Gibson, Chairman Regatta Committee A. C. A., 1885, written at my request, and as I have his permission, I desire it published, that the regatta committee for 1886 may avail themselves of the comments upon it and suggestions of others, in their meeting (Nov. 7) to arranze for programme for 1886 meet.

J. B. MCMURRICH,
Chairman Regatta Committee, A. C. A.

OSWEGO, N. Y., Oct 1, 1885.

J. B. McMurrich, Chairman Regatta Committee, A. C. A.:

I congratulate, not you, but the A. C. A., upon your appointment. I have been out of town or would have answered your letter earlier. I now gladly take the first opportunity to respond to your invitation to suggest changes in rules or programme for 1886.

I think the only change in rules which has been demanded is to allow more keel in order to give keel boats a better show against centerboards. It might be well (I don't urge it, however,) to allow added to keel clause an allowance of 3in. more for a length not exceeding 4ft. for rockered keel. But I do not believe more than one or two men want it. Keels are going out, not because of the superiority of boards in sailing, but on account of handiness and light draft, and to "let well alone" in this rule may be best.

As to programme, I have a decided opinion that it should be shortened if possible; as with all the prearrangement and early commencement it was hard to get it through this year and harder to get off extra races. In sailing races I would try omitting no ballast racers and would leave them for extra prizes, if members wish to encourage them in that way. I have always been the advocate of no ballast principles and methods, and have the satisfaction of seeing them extend rapidly, and would advocate the careful retention of the rules relating to them; but since the "no ballast" canoes show themselves so able in competition with heavier craft I believe it would be well to drop their special races for one year, as an experiment at least. The limited sail races give them some advantage. Sailing, unclassified canoes, had no entries this year and can well be dispensed with.

In paddling races I would strongly urge racing Classes II. and III. together—that is, boats under 30in. would race in one set and boats 30in. and over in another. There is very little difference in cruising canoes between 28in. (the prevalent Class III. size) and 26in. or 27in. boats, and there are fewer every year of these small boats. There is more inequality in Class IV. now than there would be in Classes II. and III. together. Two classes in sailing seem to be sufficient, and much will be gained by having only two sets paddling races. But I would leave the classification rules just as they are, simply altering programme—Event No. 1 (for example) Paddling Classes II. and III., 1 mile—instead of as on this year's card.

These changes will cut out five races and will give for each canoe two paddling, two sailing, and one combined race for record, without the upset race, which should be retained, but may be made a record race or not. This partly meets a suggestion made by a member that the record should be based on fewer races.

But the greatest benefit would be in cutting down the programme to sixteen races without disturbing rules and without barring anybody.

I was contemplating writing such a letter as this to FOREST AND STREAM, so if you think your committee would be assisted by comment upon these suggestions by other members you are quite at liberty to send it for publication.

Anything further in my power to aid your work you may command of me.

ROBERT W. GIBSON.

ALBANY, N. Y., Sept. 22, 1885.

THE RECORD AGAIN.

A CORRESPONDENT writes that in his opinion the Record should be done away with, and asks us if this is not our opinion also. His reasons are: "A Class A man beating another man only scores 10 points, while a Class B man, beating twenty others, also scores 10. That this is wrong is proved by the fact that the second man in a Class B race may score 9½ points, but the second man in a Class A only scores from 1 up, according to number of starters. [He means here, not starters, but those who finish.—Ed.]. As an instance, last year four started in the heavy board race, Isabel won, scoring 10, Boreas was second and got 1, but if the other two had punished themselves by drifting along until they had finished Boreas would have had a prize and scored 7 in the Record, putting her up quite a distance. I think I've studied the Record more than most people and it develops some astonishing things. I don't think the upset should be a Record race. There are many men like myself who do not care to upset and have not the physical strength to do it properly. I hold that muscle has too big an advantage in the Record, and skill has very little show. A man like Johnson can be certain of winning all his paddling races, but in these days of good sailors no one can be certain of winning a sailing race or even of having a place in it."

That the Record as it now stands is not perfect let us admit at once. It has been improved since last year in one point, that of counting the starters, irrespective of whether they finish or not, in calculating the points credited to those who finish. The record is designed to be as fair as possible to all. It is unfortunate that the winner must always get 10 no matter how many start—but any other way yet suggested is not as good. If the winner's points depended on the number of canoes entered in all races, the winners of the three B races would be sure to get the prize for record, as so few comparatively start in other races. When he takes a case of two canoes in Class A, and twenty in Class B, he comments upon a rare case. More than two canoes usually start in the A races. He does not say that 9½ points are too much for a second in B, but infers that 1 is too little for the A man. In any other case than this the Record is fair, being a mean between the scheme of counting points by entries and that of counting the first boat 10, the second 9, the third 8, etc., or some similar plan, no matter how many starters there may be. If any improvement on the second boat getting 1 can be suggested, the regatta committee will no doubt greet it with open arms, as it has again and again come up in club records, where but few start anyway. The example our correspondent cites is valueless, as at this year's meet the rule was changed as noted above, and had the gentleman sailed Boreas at the meet with the same result as last year he would have received the 7 points.

The Record was intended to add interest to all the races included in it, and surely it has accomplished much, as the last meet showed. The upset race was not included in '84, but the committee decided to put it in '85 programme, and because some men do not care to go in it is certainly no reason why it should be taken out. Many men have not the physical strength to paddle a race, but paddling races should not be dropped therefore. The Record is to show the best all round men and canoes, and does not interfere with the regular prizes in such races, but adds to them. If Johnson should drop out and some one appear with a canoe that could take all the sailing races our correspondent's argument would then fall through. This is just as likely to occur as it is that Johnson in future will be sure of winning every race he goes in, because he has done so for two years, when he had specially set out to win and not another man who paddled against him had done so.

It seems to us that the results thus far have justified the existence of the Record, added to the interest of regattas, induced men to enter races who otherwise would not have gone in, brought out weak and strong points of certain models, and put a check on the over active tendency to build paddling and sailing machines, pure and simple. We therefore still favor its retention.

SMALL CRUISING YACHTS VS. CANOES.

Editor Forest and Stream:

I have read the late articles in your paper concerning the respective merits of cruising canoes and small cruising yachts with interest, and am glad to see the ready response of numerous canoeists on the subject, although any person at all acquainted with canoeing would not abandon it for the reasons set forth by "Deja" in his several letters. In "Deja's" first letter he takes rather extraordinary ground, or at least it would appear so to the average reader. He starts out with the bold and sweeping assertion that canoeing is ruined, and all on the account of a certain German canoeist who, in some slight fit of insanity, put forty pounds of lead on the keel of his canoe, probably as an experiment, which, I dare say, has proved a failure before this time, as it would destroy one of the principal good qualities of a canoe—namely, buoyancy. Not content with this, he starts out on another long tirade, discussing canoes in general according to his somewhat limited experience, as his succeeding articles have proved, and says that a canoe is lacking in nearly all respects, having no freeboard, depth, etc.; in short, lacking all qualities which she should possess. Just here I would like to interrupt him and ask the question, What is a canoe? As he has shown that he is unable to answer that question, I will try and answer it for him.

A modern cruising canoe is a boat which combines to the greatest extent the qualities requisite for both inland and open water cruising; in the former including the running of rapids, traveling on canals and shallow streams, as well as broad river work; in the latter consting, with a moderate amount of rough water usage, although canoes have been known to stand up in a gale where all other boats twice their size would be at a discount. This has been fairly proved and is now generally known by the boating public, although it does not seem to have reached "Deja" yet. He then goes on to relate that "the present models of canoes before the public" are all in some particular, which he has found out, wanting, and he "having spent considerable time and money on them," has given them up as a bad job, and with the valor of a knight of old comes to the rescue with the *ne plus ultra* of a cruising craft, namely, one with 21in. draft and a hundred pounds of lead on the keel, with sails as the propelling power, looking down with scorn upon the poor canoeist who finds it to his advantage to use the paddle if the wind gives out, or in an emergency like that described by "Deja" in his article of Sept. 10. In short, to sum it up, he expects to make his 21in. draft cutter-canoe with her 100-pound lead keel run rapids, walk over sandbars, and pull herself out on shore at the word of command, as he carries no paddle nor oars to give her a lift on such occasions, but expects the wind to "do his blowing." How he is to get to shore if the wind leaves him on an open stretch of water is a mystery, unless he unships his mast and resorts to some of the much-dwelt-on poling, or rides at anchor all night, with the cheerful prospect of being run down by some steamer, together with numerous other incidents which go to make joyful the life of a cutter-canoeist.

In response to the candid questions asked by "Rob Roy" he makes rather a weak defense it must be confessed; what he will do if other canoeists bring up some more of the qualities of the canoe is hard to determine. He says that his boat will admit of landing anywhere a canoe can be landed. I would like to believe him, but I hardly see how it is to be done. According to his drawings his cutter canoe is nearly 4in. in draft at bow, with an additional extension of 6in. Now, suppose he is coming before the wind just fast enough to make a landing without smashing things, and is headed for a shelving sandy beach. 8in. deep 10ft. of shore (not an uncommon instance on the sea shore). He gets within 5ft. of the shore and owing to the peculiar shape of the keel grounds hard and fast; not having a paddle he stays there or wades ashore. Take the canoeist in a canoe of 6in. draft. He approaches the shore under moderate headway, and grounds 7ft. off shore; thanks to the buoyancy of his craft, and with a few more well directed thrusts reduces the distance to 3ft.; he now steps nimbly on deck with the painter in his hand (the canoe remaining upright due to her flat bottom) and jumps quickly ashore, afterward hauling his canoe up high and dry.

In making a carry as well as in sailing "Deja" takes it for granted that a cart and a breeze are always on hand when wanted; but in my few experiences I have found it just the reverse. His proposition about the haymaker's barn is so ridiculous that it deserves little notice. I was not aware that farmers had formed the somewhat peculiar custom of planting barns at points along or near watercourses where cutter canoeists were to be found without a breeze, and as to that romantic idea about walking home I don't think "Deja" would enjoy the "golden twilight" so much as he might after he had tramped the five or six miles between his last acquaintance with a breeze and his home, particularly at the end of a hard day's cruise. One short trip by rail doesn't amount to much; but one every other time you take a cruise during the summer would make canoeing nearly as expensive as yachting; it is cruising by rail and not by water, and consequently it is away from the subject of canoeing. In his reference in regard to the sleeping accommodations of a canoe nothing need be said. It is a well-known fact that Dr. C. A. Neidé in his 3,400 mile cruise used his canoe almost regularly for that purpose, and if his looks go very far it is safe to say that he didn't lose very much sleep on the voyage. W. K. S.

OMAHA, Neb., Sept. 29.

Editor Forest and Stream:

"Deja," having sought to kill a mosquito without building his trap, seems to have set the whole swarm buzzing about his ears. He will not get much sympathy either, I imagine, if for no other reason than his attempting to detract from Puritan's grand performance by calling her a cutter. Has he ever paused to consider? Have any of our "upland sailors," who have so much to say, considered the fact that Puritan is about one-sixth smaller than Genesta, and yet allowed time to the latter? However, "Dot," Rob Roy," and other representatives of the pretty little butterfly boats have swooped down on him, and one thousand to one are heavy odds even against a man who has the genius to design lead keel boats with planking one-eighth of an inch thick. Why don't he try his hand on fiddles? So, "Deja" having stated that he cannot race this season, and some wielders of the paddle seeming to hanker after victims new, I would like to take "Deja's" place, for this occasion only, and offer to match a 15ft. sharpie against "Guenn's" 15ft. canoe (if such be her length), the loser to subscribe $25 as he proposes. My boat is very close to 15ft. extreme length, and draws 6in. water, centerboard up. I built her for my own use two weeks ago, as a ducking and pleasure boat.

It will give me great pleasure to try conclusions with "Guenn" in a windward and leeward race at any point between here and New York city, on East River, Harlem River, or Long Island Sound. My offer is made in good faith, and if the canoeists begin to personally abuse me because I do not believe their craft capable of beating Genesta outside of Sandy Hook, well, I'll run 'em down with my sharpie the first time I catch them off Roslyn Harbor. THOMAS CLAPHAM.

ROSLYN, L. I., Oct. 3.

Editor Forest and Stream:

I cannot help believing "Katrina's" frank avowal that his knowledge of the sneakbox is limited when I read his accompanying assertion that a canoe "will both outpoint and outfoot the box to windward, in rough or smooth water, and also beat her comfortably running free." A sneakbox of 14ft. length can stand up under almost twice as much canvas as any canoe of the same length, and I never sailed one that would not compare favorably with a catboat in going to windward. With my Barnegat cruiser I overhauled and passed an oyster sloop of four or five times my burthen and three times my spread of canvas running free last week, from Sewaren to Perth Amboy, on the Staten Island Sound. The oysterer was "running light" to Prince's Bay for a cargo and was a trim built and finely modeled craft, too. I don't for a moment believe that the Barnegat cruiser will take the place of the light canoe. Their fields are entirely distinct. The light canoe and the paddle for river cruising, rapids and portaging is still, as it always has been, my favorite; but for open water work, where sailing is a constant factor, or for a long cruise, part sailing, part rowing, and no portaging, a canoe or a canoe yawl cannot compare with the Barnegat cruiser for safety, comfort, ease and certainty; and if you want speed—which I do not so much care for—there is certainly no comparison between a canoe and a Barnegat cruiser. For paddling about a club house afternoons and for eliciting the admiration of one's lady friends the canoe will always hold its own, because the Barnegat cruiser to the unnautical eye is the "homeliest" boat that floats; but cruisers who do not incline to be dudes and all men who go afloat for the love of Dame Nature will, if they understand boats, admire such craft as mine. "Handsome is as handsome does," you know.

I could better convince "Katrina" of the excellent points of the Barnegat cruiser if he were to see her. As we do not live so very far apart it might be possible for him to drop in on me and take a look at her, or perhaps a short cruise in her. I should be always glad to exhioit her to any man of "Katrina's" stamp, although she is not yet fully equipped and fitted up. My address can be had from FOREST AND STREAM, and a card from that paper is a sufficient introduction.

SENECA.

KNICKERBOCKER C. C. FALL REGATTA.

THE annual fall regatta of the Knickerbocker C. C. took place at the club house at the foot of 152d street and North River on Saturday, Sept. 26.

The first race was a special one for paddling in open boats between Messrs. M. G. Foster and Edwin Gould, distance one mile with turn, over a very rough course, and was won by Mr. Foster, leading by 15 seconds.

The second race was for sailing, and was called at 4 P. M. Course, a triangular one of about three miles. Entries:

	Time.
Class B, G. O. Totten, Essex C. C.	35 17
Freak, Class B, C. V. R. Schuyler B. C. C.	38 01
Inertia, Class B, Edw. Brown	Upset
Nettie No. 2, Class B., E. Fowler	Did not finish
Tiny, Class A, A. L. Gardner (once around)	30 00
Nettie No. 1, Class A, W. L. Green	32 35

Nettie No. 2 withdrew from the race in order to help the Inertia, and the Class A boats withdrew after going over the course once, and on account of Mr. Gardner fouling one of the stakeboats, and the race was given to Mr. Green.

The third event was a tandem race, one mile with turn. Entries:

	Time.
Laura, Messrs. M. G. Foster and E. C. Griffin	5 15
Freak, Messrs. Schuyler and Brokaw, B. C. C.	5 19
No Name, Messrs. Totten and Gould	5 30

The fourth race was for paddling, Class 4, one mile with turn. Entries:

	Time.
Laura, M. G. Foster	6 00
Daisy, G. O. Totten	6 05
Nettie, O. Lowenthal	Not taken

The fifth event was an upset race. Entries: M. G. Foster, C. C. Taylor and George Cox, Ianthe C. C. The race was won by Mr. Foster, with Mr. Taylor a good second. Mr. Cox did not succeed in upsetting his boat.

"PADDLE YOUR OWN CANOE."—The author of the song is Mrs. Sarah T. Bolton, who is living, at the age of seventy-one, at St. Louis. Of the author and the song the St. Louis *Republican* says: "Her volume of poetry, which appeared in 1880, contained 156 poems, a collection of the best efforts of her long and busy life, the most pretentious being that of "Leoline" and the one held in highest esteem by William Cullen Bryant, "Left on the Battlefield." Singularly enough very few people remember that Mrs. Bolton was the author of the famous song, "Paddle Your Own Canoe," which has been sung around the globe and paraphrased and distorted by alleged humorists until to-day only a few are able to recall its dignified, rythmical versification, although every man, woman and child on this continent would be quick to resent the insinuation of unfamiliarity with it. This song was written under peculiar circumstances. Mr. Bolton had been elected State Librarian of Indiana in 1847, and his duties included the care of the State House and grounds. During the excitement incident to the compromise legislation of 1850 Governor Wright invited the Governors of the Western States, North and South, to hold a conference at Indianapolis. This necessitated throwing open the State House for a reception, and the Senate Chamber needed a new carpet. Mr. Bolton purchased the carpet, but help could not be obtained to stitch it together, so Mrs. Bolton took the matter in hand, and sewed the carpet herself, working night and day until it was finished. Then she wrote the song, "Paddle Your Own Canoe." During the dark days from 1836 to 1845 she seldom wrote anything to which she was not prompted by some great occasion, but many of her poems of that description are worthy of remembrance, among them the poem written on the bringing home to Indiana of the remains of Gen. T. A. Howard, who died at his post while charge d'affaires at the republican court of Texas; the refusal of Gen. Jackson to accept the sarcophagus of Alexander Severus; the failure of the revolution in Rhode Island; the imprisonment of Gov. Dorr, and the death of Gen. Jackson.

MR. JOHNSON'S RECORD; A CORRECTION.—Our attention has been called to an error in our notes on the record in the FOREST AND STREAM of Aug. 20, in which it is stated that Mr. Johnson made his record in 1884 in two canoes. The mistake was entirely unintentional, as the races that scored in the record were all won in the same canoe, and had the races won in two canoes been scored Mr. Johnson's average would have been much higher.

HARTFORD C. C.—The Hartford C. C. will hold their fall regatta on Oct. 10.

BROCKVILLE C. C. SKIFF RACE.—The concluding race of the Brockville C. C. for skiffs and canoes was sailed on Sept. 28, the course being around Old Man's Island, spar buoy, Oriental Island, and home, to be sailed twice. The starters were skiffs sailed by J. E. Chrysler, J. G. Findlay, H. Coates, G. C. McLean, M. Saure, R. C. Jameson, and G. Trourbeck, and the canoe Grebe, B. W. Richards. Findlay led the first round, with Richards second. On the last round the wind was very variable, dying out at times. Chrysler profited by a strong breeze and ran in half an hour ahead and winning the cup, leaving the others becalmed. Grebe finished second. Mr. Richards has sold the Grebe to another member of the B. C. C. and will build a new canoe this winter.

MORE OF THE TWO THOUSAND HEARD FROM.—We make the following extracts from a private letter to "Dot" concerning "Deja's" attack on him. "Thetis" writes: "Have just finished the FOREST AND STREAM. Now, who is 'Deja?' Is he not a vast joke of the editor, and does he exist only in imagination? I believe that you and the said editor are having a good joke on all the canoeists. Won't they pitch into you if they find that what I suspect is true." Com. Jones, of the Hartford C. C., writes us: "I accept with pleasure 'Dot's' nomination, and if 'Deja' sails in my home waters, the Connecticut River or Long Island Sound, from Larchmont to Watch Hill, I shall be pleased to sail the Venture against him."

SHATTEMUC C. C.—Sing Sing, N. Y., Oct. 2.—*Editor Forest and Stream:* The fall regatta of this club will take place Saturday, Oct. 10, at 3:30 P. M. The races are open to all. Canoeists are invited to attend. By communicating with the purser any information in regard to transportation will be furnished. There will be paddling, sailing and tandem races.—G. FISHER SECOR, Purser.

NEW YORK C. C.—The house has been hauled into the old Seawanhaka Y. C. basin at Tompkinsville, where it will be kept all winter.

OTTAWA C. C. RACES.—On Sept. 26 the tandem race took place between Hemming and Baldwin, Brough and Wheeler, and Wicksteed and Evans. Messrs. Hemming and Baldwin used single blades and Brough and Wheeler used double. The former crew led at the turn and also at the finish, with Brough and Wheeler second.

Answers to Correspondents.

☞ **No Notice Taken of Anonymous Correspondents.**

A. S., New York.—We have made unsuccessful application for the lines.

W. Y. P.—1. The killdeer plover is edible. 2. Frogs may be caught by baiting a hook with a bit of red flannel.

F. B. P.—"Hallock's Sportsman's Gazetteer" is probably the best of its class. We will give the information about Frank Forester in a subsequent issue.

G. N. E.—The New Jersey law does not specify wild doves nor wild-fowl except woodduck (open season Sept. 1-Jan. 1). We cannot tell you about Bound Brook.

J. H., Lyme, Conn.—Can you inform me if there are any moccasin snakes in the counties of Accomack and Northampton, Virginia? Ans.—Probably both the water moccasin (*Toxicophis piscivorus*) and the highland or upland moccasin (*Toxicophis atrofuscus*) are to be found there.

D. B. G., Melbourne, Fla.—1. The turkey buzzards belong in the order *Raptores* (birds of prey), sub-order *Cathartides* (from Greek word *Kathartes*, a purifier), American vultures. 2. The bird you refer to is probably the sandhill crane. Send us a more detailed description of it.

PROFESSOR, Philadelphia.—You speak of the Philadelphia "fall" dog show. Should you not say "autumn" show. "Fall," used in the sense of autumn, is not good English. Ans. The word "fall" in this sense is good enough English for us or for any one else. It is older than the city of Philadelphia, and was correctly so used before there were any dogs in North America worth showing.

F. L. W.—I have an Italian friend who, having heard of our fast American yachts, wishes to have one of about thirty tons built here to race in the Mediterranean and the waters thereabouts. Please recommend model, rig, etc. Ans.—We commend you to send your friend a copy of Mr. Kunhardt's "Small Yachts," which contains plans and specifications of all types of yachts.

F. A. W., Northbridge, Mass.—1. A friend and myself have a small pond, ¾ of an acre, fed by a spring, clay and sand bottom, which we want to stock with some fish that are gamy, good food fish, that will do well and grow fast. What is your advice? Do you think trout or carp or what are the best? 2. Can carp be caught easily by hook and worm? I understand they won't rise to a fly, am I right? Ans. 1. If your pond is cool enough for trout they will find food in it and are the best. Next, for game qualities, stock with black bass. Carp will give the most food if the water is warm, but are worthless as game. No, the carp is a wary fish, and though it sometimes takes a bait, is not certain unless accustomed to being fed. They do not take the fly, as a rule, although one or two cases are on record of their doing so.

INFORMATION WANTED.

MYSTIC, New York, having ordered a new gun, wants to know of a good place to test its shooting qualities over partridge, quail, or gray squirrels.

T. H. CHUBB'S

"Henshall" Split Bamboo Bass Rod.

This cut represents our "Henshall" Split Bamboo Bass Rod length, 8 feet 3 3-10 inches; weight 8 oz. This rod has extra tip light wood hand-grasp whipped with cane. Metal reel seat, or reel bands, as preferred. Hexagonal cap ferrules, with welt, no dowels, anti-friction tie guides. Three-ring tops, nickel plated trimmings fastened on. These rods are all ready for use, with the exception of winding and varnishing, for $7.50. This rod is made according to the dimensions given us by Dr. Henshall, and is indorsed by him as a "Standard Henshall Rod." Above rod with German silver trimmings, instead of nickel, $9.25. Send for catalogue of Trout and Bass Fly Rods, also Amateur and Rod Makers' Supplies, to

T. H. CHUBB, Post Mills, Orange Co., Vt.

"FOREST AND STREAM SERIES."

DEER HUNTING.

BY JUDGE JOHN DEAN CATON.

BY and by it will be time to hunt antelope and deer. It is always time to read about them. Judge Caton's book on the antelope, elk, deer, moose and caribou of America discusses in a readable way the life history of these animals and the methods of their capture. It is the work of an enthusiastic sportsman who has had a wide experience and has devoted the leisure of years to studying these interesting game animals. The volume is very fully illustrated, and is a perfect storehouse of information and entertainment. The first edition was sold by the Boston publishers at $4. Price $2.50.

WOODCRAFT.

BY "NESSMUK."

A COMPACT pocket handbook of condensed, boiled-down, concise, clear, comprehensive, sensible, practical camp gumption. "Nessmuk" has been "in the woods" in Michigan, New York, Pennsylvania, and South America, and this is a book for outers, wherever they kindle their camp-fire. The author believes in "smoothing it." He has learned how; now he tells others. It is much easier to learn from "Nessmuk" than from Dame Experience. We should not be surprised if "Woodcraft" completely revolutionized the methods of camping out. If you are going to the woods, read "Woodcraft" before you go. It may add to your trip a hundred fold. Price $1.00.

DOG TRAINING.

BY S. T. HAMMOND.

HE was a promising puppy, and when you turned him over to the breaker to be educated, you thought he was bound to make "the best dog in the world." And you'll not soon forget how disappointed and disgusted you were when the dog, the breaker and the big bill—all three turned up together, and you saw that the animal's spirit was broken and it would take a steam calliope to make him mind. Now, this could not have happened if you had been wise enough to buy a copy of Hammond's book, and in your odd leisure moments *train* the dog yourself instead of having him *broken* by some one else. We are selling edition after edition of this book, and it is revolutionizing the system of preparing dogs for work in the field. Price $1.00.

SHORE BIRDS.

A PAMPHLET for those who "gun" along the shore. Tells of: I. Haunts and Habits—Where the bay birds live and what they do at home. II. Range and Migration—Where they go to breed and where to spend the winter. III. A Morning Without the Birds—An episode of shore shooting. IV. Nomenclature—A list of our American species of *Limicolæ*, with a description of each species. V. Localities—Where to go to shoot them. VI. Blinds and Decoys—How to shoot them after you have reached the grounds. 45 pp., paper. Price 15 cents.

ANGLING TALKS.

BY GEORGE DAWSON.

AS a political writer of conceded power, Mr. Dawson wielded a trenchant pen; when he turned from the conflict of parties to the praise of the favorite pastime of "simple wise men," his essays, limpid as the crystal streams, are aglow with the soft summer sunlight and melodious with the songs of birds. When angling was the theme, he wrote from a full heart and in closest sympathy with the scenes and pursuits described. These "Talks" are brimful of manly, wholesome sentiment; there is in them all not a particle of cant. Their sincerity and overflowing spirit at once win the reader, and he perforce shares the author's enthusiasm. The effect is magical, like that of the mimic players in Xenophon's *Memorabilia:* he who reads, if he be an angler, must go a-fishing; and if he be not, straightway then must he become one.—*Extract from Publishers' Preface.* Cloth, price 50 cents.

CANOE "AURORA."

BY DR. C. A. NEIDÉ.

A CHARMINGLY written and always entertaining account of a canoe cruise from Lake George, New York, down the Ohio and Mississippi Rivers to the Gulf of Mexico, by the Secretary of the American Canoe Association. To read the cruise of the "Aurora" is the next best thing to having made it; and the reading is decidedly more pleasant than would have been participation in some of the misadventures related. 216 pp., cloth. Price $1.00.

Any of the above books can be obtained in London of Davies & Co., 1 Finch Lane, Cornhill.

SMALL YACHTS.

Their Design and Construction, Exemplified by the Ruling Types of Modern Practice.

By C. P. KUNHARDT.

The Forest and Stream Publishing Company takes pleasure in announcing the immediate publication of a magnificent folio volume, bearing the above title. This book is intended to cover the field of Small Yachts, with special regard to their design, construction, equipment and keep. The opening chapters are devoted to a consideration of the model and the draft, their relations to one another, and the purposes which they subserve. Full directions are given for producing the plans of a yacht with reference to the chief points in design, and the method of taking off the lines of a boat already built is likewise described in detail.

All elements entering into design, such as Resistance, Stability, Balance of Rig, Handiness, Displacement, etc., are dealt with in separate chapters. The rules necessary for the mathematical computations, and a review of theory and practice close the first division of the book.

The second portion comprises the description of the Plates, covering the whole range of type in small yachts, from the shoal catboat and American centerboard sloop to examples of the narrowest and deepest British cutter yet built. These yachts have their lines, build and fittings depicted in the Plates, which are drawn to scale. With their aid and the specifications presented, the reader is placed in possession of accurate information concerning the mould, accommodations, rig and characteristics of all styles of yachts which have received favorable recognition. Sporting boats, combination row and sailboats, and various examples of special form are introduced.

The third division offers a comprehensive review of single-hand sailing, to which small yachts are especially adapted. Directions are given as a guide in selection of type and sail plan, and subsequent equipment and proper management.

The iron work of yachts, their gear, yawls, steering apparatus, boat building and much other closely related matter is entered upon. The new International Rules of the Road, Signal Service, and a bibliography appear in the Appendix.

The work is profusely and handsomely illustrated with 150 illustrations inserted in the text, besides the sixty-three plates as follows:

LIST OF PLATES.

I. The Sloop Yacht Schemer.
II. The Nuckel.
III. The Windward.
IV. A Newport Catboat—Portable Catboat.

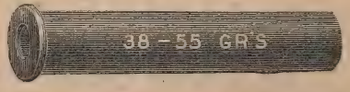
STANDARD REVOLVERS. Harrington & Richardson New Extracting Revolvers. AMERICAN ARMS CO. Extracting Revolvers. L. M. C. Breech-Loading Implements.

The "UNION HILL" Ballard.

This gun has met with an unprecedented success since its introduction, far exceeding all expectations. For several months the manufacturers could not supply one-quarter the demand. It meets the call for a target rifle, made with the same care as the finest finish, at a medium price, and has demonstrated that a .32-caliber with proper proportions of powder and lead, is sufficient for 200 or 300-yard work. **Two-thirds of all target rifles in use in this country are Ballards, showing that they are recognized as the leader.**



Prices: No. 8.—Half Octagon Barrel, Pistol Grip Stock, Cheek Piece, Nickeled, Off-Hand Butt Plate, Double Set Triggers, Graduated Peep and Globe Sights, 9½lbs., 28 and 30 inches..... $37 50
No. 9.—Same, but with Single Trigger..... 33 00
Can be furnished with Vernier's Mid-Range and Wind Gauge Front Sights for $6.50 extra.

EVERLASTING SHELLS, 32-40, 6cts. Each.

Grooved Bullets, .32-caliber, 165 grains	per 1000,	$7.25
" " " 185 "	"	7.75

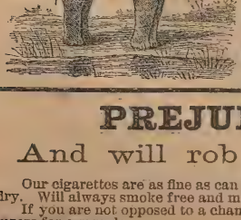
Canoe and Camp Cookery.

By "SENECA."



A practical cook book for canoeists, Corinthian sailors and outers. Practical because the author gives explicit and intelligible directions for preparing such dishes as he has himself actually tested in camp and on a cruise. This is just where the recipes differ from the absurdly impracticable dishes given in some so-called camp cookery books. The cooking outfit is described, and numerous hints on camp economy add to the value of the work. Cloth, 96 pages. Price $1.00.

CANOE

THE FOREST AND STREAM began a year ago the publication of a series of papers on canoe construction, by Mr. W. P. Stephens, of the New York C. C., widely known as an expert on canoe design and building. These papers, having appeared through the year in our columns, have since been rewritten, and with numerous additions are now published in a handsome volume under the title of "Canoe and Boat Building for Amateurs." Mr. Stephens is peculiarly fitted for the preparation of such a work, beginning as an amateur, and having after a long experience of the difficulties attending a learner, taken a prominent place among canoe builders, due both to the model and workmanship of his canoes. Realizing fully the difficulty of explaining to a novice an art in itself far from easy,

AND

and with which he is entirely unfamiliar, the book begins with a description of the various classes of canoes in general use, with their main features and dimensions, and definitions of the terms used in connection with them. Numerous examples of canoes are given, and in connection with them, such plain instructions in designing as will enable the beginner to select intelligently the proper craft for his pur-

BOAT

pose, and to plan her dimensions, details and fittings. To this end designs of all classes of canoes are given, with full dimensions and details. The object has been not merely to enable the tyro to build one boat as described, but to teach him the principles of designing and building in such a way that he may construct such a craft as he desires. Following the chapters on designing, the construction of a canoe is taken up in detail, the tools and appliances being first clearly described, as well as the various materials, after which follows the actual work of building. Every operation is taken up in order, from the selection of the keel to the varnishing of the finished boat, and illustrated with numerous diagrams.

A chapter on sails describes all the varieties in use by canoeists, down to the new Mohican settee, with directions for making, rigging and measuring them, while the method of proportioning the sails to the boat is clearly explained, all the calculations

BUILDING

being worked out in detail. The many minor points of a canoe, paddles, steering gears, rudders, aprons, and camp outfit are also described at length, while a chapter is devoted to canvas canoes.

The subject of boat building is fully treated, a rowboat of the usual construction being taken as an example, and described in all its parts in such a manner as to make clear the principles involved, and their application to any form of boat, either lapstreak or carvel build. Each of the numerous technical terms belonging to the subject is defined clearly when it first occurs, and as the index is full and complete, the book is in itself a glossary.

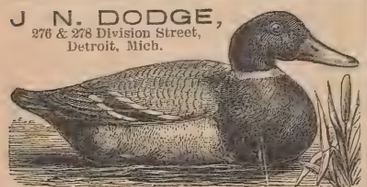
In addition to the numerous diagrams in the body of the work, twenty-four large plates are printed on bond paper, containing the working drawings of canoes for paddling, sailing, cruising

FOR

and racing, with their sail plans, rowing sailing boats, large canoe yawls, and various boats for special purposes, such as gunning boats, yacht boats, and the widely known sneakbox.

The canoe yawl, a boat between a canoe and a yacht, is illustrated by examples of various craft from 17 to 20ft. long, and suitable for a crew of two or three on a cruise. This class of boat, while little known among us as yet, is admirably fitted for cruising, and will meet the wants of many who object to a canoe as being too small, and yet desire a boat with the same excellent qualities. The boats and canoes illustrated are in all cases among the best of their class, the list of canoes including English, Scotch and American craft, and are all drawn

AMATEURS.



to scale, so as to be available as working drawings. The plates, for convenience in using, are placed loose in a tough manilla envelope and accompany the book.

Pp. 168, with 24 plates of working drawings. Price $1.50. Address,

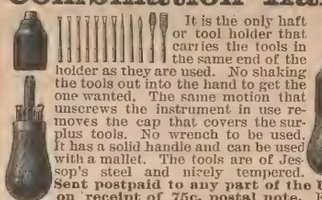
Detroit, Mich.



Manufacturer of Cedar Decoy Ducks of all kinds. First quality, $9 per doz.; second quality, $7 per doz.; third quality, $5 per doz. Also Geese, Brant, Swan, Coot and Snipe Decoys. Duck and Turkey Calls. Decoys made like any pattern furnished without extra charge.

St. Clair Flats Pattern, much larger than the bird; less than one-third the weight of solid decoys. The exact position of a duck on water at rest and unalarmed. The lightest and best decoys made. Heads in different positions; glass eyes, hollow and flat bottom. Do not require weighting to keep them upright. Painted the exact imitation of the natural bird. $15 per doz. Sold by all gun dealers, to whom I give a large discount. If your dealer does not keep them I will send, freight paid, on receipt of price. Illustrated price list free. I also make solid decoys after the Monroe Marsh Pattern, semi-flat bottom; price $11 per doz.

A Handy Tool for Sportsmen.

HENRY'S PATENT
Combination Haft.

It is the only haft or tool holder that carries the tools in the same end of the holder as they are used. No shaking the tools out into the hand to get the one wanted. The same motion that unscrews the instrument in use removes the cap that covers the surplus tools. No wrench to be used. It has a solid handle and can be used with a mallet. The tools are of Jessop's steel and nicely tempered. **Sent postpaid to any part of the U. S. on receipt of 75c. postal note.** Extra Brad Awls, 15c. per doz. **JOSHUA BRITTON & SON,** STOUGHTON, MASS.

ANSWERS TO CORRESPONDENTS.

TEACHERS FOR THE INDIANS.

WHAT shall be done with the Indians? What measures shall be taken to make them self-supporting, to civilize them, to fit them for citizenship? These are questions which possess an ever increasing interest for us all.

It is needless to refer to the past, to the horrible record of shame which must ever remain a foul blot on our boasted American civilization. That past we must lament, but its wrongs cannot now be remedied. We are too much accustomed to think that in years gone by the Indians were robbed and ill treated, their lands taken from them by force or fraud, and the supplies issued to them by the Government passed over to swindlers who hang about the agencies, and find it an easy matter to delude these simple and ignorant people. All these things, we say, used to be done, but better times have come and now the Indians are properly cared for. Unhappily this is not the case. The shocking story of the starvation of a tribe told on another page shows too clearly how utterly at the mercy of a dishonest or incompetent man these people still are. Nor is this an isolated case. The same year that the Piegans starved, the Assinaboines at Poplar River on the Missouri, lost one-third of their number from the same cause. A terrible amount of power is given to an Indian agent. He holds the welfare—indeed the lives—of the people under his charge in the hollow of his hand, and if he be dishonest or incompetent, he can work an inconceivable amount of mischief. And since among so many agents some are almost sure to be worthless, it is evident that by our present system the Indians are always in danger of suffering.

In years gone by, when many tribes were hostile, when an apparently inexhaustible supply of buffalo and other game roamed over the plains, when there were no railroads in the West and the settlements were few in number, the charge of the Indians ought to have been transferred to the War Department. Had this been done, hundreds of lives and millions of money would have been saved. But the political methods then in existence forbade this. To have given up the charge of the Indians would have robbed the Interior Department of a great deal of patronage and the number of places which might be given as rewards to political "workers" would have been decreased. Now, when the West is so rapidly settling up, when the game is gone and the Indians are dependent on the supplies issued them by the Government, there is less need of such a change. But the Indians must be protected, must be supported, must be taught that if a man would live he must work.

It is the fashion for those who have given no thought to this question to say, "If the Indian will not work let him starve." Such a remark shows an utter lack of intelligence on the part of the persons making it. One might as well say to a bricklayer, "If you will not make a watch you may starve." An Indian knows how to do certain things, because he has been taught. He can hunt, he knows how to set traps, he can follow a trail. But he does not know how to plow, or to drive a mowing machine, or to set type, or to navigate an ocean steamer. And why? Because he has never been taught. These things are all new to him. How should he understand them? If the Indian—the wild Indian of the plains and the mountains—is to become self-supporting he must follow the white man's road and work; but it is the duty of the Government which has taken from him his country and his food to support him until he shall have learned to work and to earn for himself that living which he made before he had been deprived of it by the whites.

Farming and stock raising are the only two methods by which the Indians of the West can become self-supporting. But a knowledge of farming is not born in a white man—and still less in an Indian—nor does a babe imbibe with his mother's milk experience in the stock business. These are matters of education. An Indian must be taught how to prepare the ground, how to sow the seed, to cultivate the crop and finally how to gather in the harvest. He must be taught how to use tools and implements, how to build houses and barns, and how to care for his animals.

At most agencies there is an employee who is termed the agency farmer. He is supposed to teach the Indians how to perform all the operations which we have enumerated, but as a matter of fact his time is almost wholly taken up in getting the agency crops into the ground, and in harvesting them. Even if he devoted himself wholly to teaching the Indians, he could accomplish very little, for on many agencies there are several thousand Indians, and on very few does the number run below one thousand.

The Indians must be taught how to cultivate the ground and raise crops, but this teaching must be done in an intelligent way. To every twenty or thirty families a farmer should be assigned, whose duty it should be to devote himself wholly to the task of teaching the men and older boys how to perform the various operations of farming. At first this cultivation would necessarily be in common, but after one season, to those who show a disposition to work, wagons and tools should be issued as they progress in knowledge, and they should be encouraged to fence and cultivate pieces of land for themselves, always under the supervision of an instructor. It would be well to have the agent authorized to purchase from them such portion of their crops as they might not need, paying them in tickets, with which they could buy at the agency store clothing, and such luxuries as they might desire in the way of food. Great care would have to be exercised in the selection of these teachers. They should be men of discretion and judgment, for the Indian is not accustomed to work in the fields, and will be easily discouraged if all does not go well with his crop, or even by the long continued work. Firmness, judgment and a patient willingness to explain things over and over again are essential requisites in one who is teaching Indians. They are, after all, merely grown up children.

Besides these farmers, who, however, must be the main dependence in this system of Indian education, there should be several carpenters and several blacksmiths; not, be it remembered, merely to do the agency work, which one man can easily attend to, but to instruct such Indian boys as may show a disposition to use tools. We have seen a number of Indians who were good blacksmiths, and as farming comes to be the pursuit of any tribe, there will be a great deal of this kind of work to be done.

We have touched very lightly on the measures to be taken to render the Indians self-supporting and self-respecting at the present time; only of the education of the adult Indians. In many tribes the men have already come to acknowledge the necessity of labor, and are taking hold with an energy that is most praiseworthy, though with an ignorance that is pathetic. They no longer feel that to work is disgraceful, and are ready, if the opportunity is given them, to put their hands to the plow.

The consideration of a far more important subject—the education of the young—must for the present be postponed. On this depends the future of the race.

THE FOREST AND STREAM'S TRAJECTORY TEST.

AFTER ten days of field work the outdoor part of the trajectory trials is virtually concluded, and a portion of the immense amount of calculation over the screens has been made. When it is understood that there are between forty and fifty separate tests, each to be made at two distances and each again through three tissue paper screens, and then finally to introduce five as a multiplier, for each final trajectory is founded upon an average of five shots, the reader may form some idea of the amount of care and labor undertaken to get at that heretofore indefinite quantity—the experimentally-deduced line of fire in our standard American hunting rifles.

As the trials have been in progress we have been favored by visits at the range from many representatives of the firms interested, as well as by riflemen who take a personal interest in the question under trial. There have been many suggestions made and points of advice offered. Some of these opened up possible objections which might come up after the trials had closed, for none knew better than we the probability of hair-splitting theories and caviling censure which come in a subject such as rifle shooting, where there is so much rule o' thumb inaccuracy foisted upon a very narrow platform of fact, founded upon actual scientific experiment. It was to put a stopper to a great flood of much of this wild talk and absurd claim that this expensive and comprehensive series of tests were undertaken. They will present in a standard form just what the rifles of to-day, fired with a given ammunition and under specified conditions, are capable of doing—not in the way of accuracy, for that involves an entirely different system of testing, but what they do in regard to flatness of the flight line.

THE CANOEISTS AND THEIR CRITICS.

THE small war that has waged in our columns for a few weeks past between the canoemen and a rash critic who dared to make a fierce onslaught on their beloved boats, is not only amusing, but speaks well for the pluck and *esprit du corps* of the mosquito sailors, whose craft are measured in inches, but whose spirit is in inverse proportion to the tonnage of their boats, as any one who dares to question the many good qualities of the latter soon finds to his cost. They are certainly ready with their pens, and have charged with some effect on the latest intruder, and that they are no less ready on the water is proved by the challenges that the "cutter canoe" has received, but which unfortunately he is unable to answer this season.

More than a year ago a friend of the humble but convenient sneakbox ventured to assert its superiority to the canoe on all points, especially that of speed, and he met at once with an equally warm reception, both in controversy and in the shape of challenges, until he finally fled ingloriously from the field with the assertion that, though his boat was the fastest, he was not a racing man. After the poor showing our big yachts have made against the English visitor in all the open races, it is refreshing to turn to the fighting craft of the canoe fleet, whose owners are even now taking steps to provide an International Challenge Cup to induce English canoeists to visit us next summer, and one is apt to wish that some of the true sporting spirit and fondness for racing that is floating about in hundred-pound canoes could not be transferred to some of our hundred-ton yachts.

AMONG THE PERILS OF ANGLING mentioned in these columns was noted the case of a person holding a position of trust, whose prolonged absence was accepted as a proof that he had fled as a defaulter, but who was subsequently found to be on a fishing excursion where the fish were abundant. In contrast with this, a case has just come to light in which an implement agent set out ostensibly on a hunting trip, but actually to evade the officers of the law. The old joke of the hunter hunted was here repeated, for the fugitive was caught by the pursuers and lodged in jail.

GAME COMPUTATION.—In Oregon and Washington Territory they guess at the number of wild ducks and geese, making the figures as high as possible, and then multiply this by four. A Georgia man, in the Sixty eighth District of Burke county, who has seen three flocks of wild turkeys, with twenty to a flock, estimates the total number within two miles of his house as 2,000. The Georgia computation is a slightly more visionary method than that of the Northwest.

SALMON IN THE HUDSON.—The salmon fry placed in the streams tributary to the Hudson have thrived, at least there is evidence to show that some of them have done well. A letter on the subject will be given in our next issue.

THE FAMINE WINTER.

I.—ALMOST-A DOG'S STORY.

"MANY years ago this country belonged to the Pegunny. North of Belly River lived the Blackfeet; that was their country. The Bloods owned all the ground between Belly River and the Missouri. The North Piegans had their home north of the Cypress Mountains, and the South Piegans owned the country from the Missouri south to beyond the Yellowstone. Then my people were strong and many in number. When they went to war they had to go very far south, for the country was all theirs and their enemies dared not come on it. Only sometimes the Koottenais came out of the mountains, and we fought them. Far the men had to go to war, so far that it often took two seasons to make the journey; one summer they went and one they came back. Sometimes they went so far south that there were no more any mountains. When they made these long journeys to war their clothing would be all worn out before they returned, and because they had no women with them to make buckskin, they made for themselves clothes from the skins of coyotes and gray wolves, and moccasins from the skin of the shank of the buffalo, sewing up the end where the hoof was cut off. Things were so until the white men came. Then the country was all ours. Now the white men own it all, and we have to stay in one place; so little of our ground is left to us. We talk much about this among ourselves and say that the white men have taken all our country and never paid us for it. But what can we do? We are poor and weak now, though once very strong."

The speaker paused, and his face was clouded with a look of indescribable sadness as he recalled the former greatness of his people. He was a venerable Piegan, whose erect form and easy movements told little of his age. His long gray hair and his face seamed with wrinkles, and marked with more than one scar confirmed his statement that he was very old.

It was at the Piegan agency in Northern Montana. We were sitting in Mr. Joseph Kipp's trading store, and that gentleman was interpreting for me while I talked with Almost-a-Dog. Mr. Kipp had told me that he was one of the oldest men in the tribe, that he was truthful, had been a brave warrior, and although he bore on his person more than one scar made by the white man's bullet, he yet professed to have been ever a friend of our race. Almost-a-Dog and two others were the only ones left alive out of the twenty lodges of Piegans which were surprised in the Baker fight, and at that time he had saved the life of a white man who now lives at Fort Benton, Montana. I could feel when I shook hands with the old man the crooked fingers, crippled by a ball in that fight, and on his neck and cheek could see the deep furrow ploughed by another which he had carried for years.

"Father," said I, "when you were young what kind of knives did the Pegunny use?"

"When I was a young man and first began to hunt we used knives made of rock. Our arrow points, too, were of stone, but they were hard and strong. A man could drive one far into a buffalo. They were good for war, too, for the rock was poisonous, and the wound which they made festered and caused a bad sore, even if it did not kill at once. We made the arrow points of the black stone which comes from the South. Now we have none of the knives nor the arrow heads. All have been lost. With these weapons we could well kill buffalo. But before we had the elk dog (horse) we used to drive the buffalo into piskans, and over high cut banks, where they would kill themselves in falling. There is one of these places over on Two Medicine Lodge Creek, near Red Eagle's camp. That place was used by our fathers. It is sacred, and you will see there a pile of horns which have been gathered and given to the Sun. Once this pile was large and high, but now there are no more buffalo and we can no longer add to the heap."

"Tell me, Father, did the Pegunny have horses when you were a young man, and where did the horses come from?"

"Yes, we had horses when I was young. I have been told that the first ones we got came in this way:

"Long ago a Piegan warrior's secret helper—some beast or bird, I do not know what—came to him in a dream and told him about a lake, far away, where were some large animals which were harmless and which he could catch, tame and use to pack on, like dogs. And because they were large and could carry a heavy load they would be better to use than the dogs, on which the people then used to carry their packs. 'Go to this lake,' said his medicine, 'and take with you a rope, so that you can catch these large animals.' So the man took a rope of bull's hide, and went to the shores of the great lake, and dug a hole in the sand on the shore and hid in it. While he watched he saw many animals come down to the lake to drink. Deer he saw and coyotes and elk and buffalo. They all came and drank. After a while the wind began to blow, and the waves to rise, and wash upon the beach, saying *sh-h-h-h-h, sh-h-h-h-h.* And at last came a band of large animals unlike any that the man had ever seen before. They were large like an elk, and had small ears and long tails hanging down. Some were white, and some black, and some red and spotted. All colors had they. The young ones were smaller. When they came down to the water's edge and stopped to drink, his secret helper said to the man, 'These are the animals; throw your rope and catch one.' So the man coiled his rope and jumped up and threw it, and caught one of the largest of the animals. It pulled and struggled, and dragged the man about, and he was not strong enough to hold it, and at length it pulled the rope out of his hands, and the whole band ran into the lake and under the water and were not seen again. So the man went back to the camp feeling very sorry. And he prayed for help to Old Man, but he would not help him, but he said: 'Four times you may try to catch these animals. If in four times trying you do not get them, you will never see them again.' Then the man fasted, and made presents to the Sun and to Old Man, and prayed to his secret helper, and in a dream it told that he was not strong enough to catch a big one, and that he ought to try to catch one of the young, then he could hold it. So the man went again to the shores of the big lake, and again dug a hole in the sand, and lay hidden there. Again he saw all the animals come down to drink; the deer, the wolves, the elk and the buffalo. At last the wind began to rise and the waves to roll and to say *sh-h-h-h-h, sh-h-h-h-h,* upon the shore. Then came the band of strange animals to drink at the lake. Again the man threw his rope, and this time he caught one of the young, and this he was able to hold. He caught all the young ones out of the band, and took them to the camp. At first the people were afraid of these new animals, and would not go near them, but the man who had caught them told everybody that they were harmless. After a while they became tame, so that they did not have to be tied up, but followed the camp about as it moved from place to place. Then the people began to put packs on them and to ride them. And they called them *Pō-nō kah'-me-ta,* that is elk dog, because they are big and shaped like an elk and carry a pack like a dog. This is how the Pegunny got their horses.

"Some say that the first horses we had were found far to the south along a white man's trail. Anyhow when I was young we had plenty of horses.

"In those days the buffalo were very plenty. The plains were dark with them. Then we had meat enough to eat and robes and cowskins, more than we could use. Sometimes we got a white robe and that we gave to the Sun. There was nothing to do but to hunt and eat, and sleep and dance and sing. We were happy.

"My father and his father had told me about white men who had passed through the country before I was born. They had guns and knives and many other strange things that we had never seen, but they had come and gone. We talked about them, but did not expect to see them again. Then when I was a young man [in 1832] came Joe's father, and after him other white men. We were glad to see them come. They brought guns and knives, and beads and sugar, and traded them for robes and furs. Their medicine was very strong."

He paused for a moment and then broke out again:

"Our god is a poor god. He must be part devil, I think. See what your god has done for you; how strong he is. He has given you many things; guns and wagons and steamboats and everything that you could want, and he has taught you how to do many strange things, to put words on paper and to talk a long way off. Our god gave us nothing but the buffalo, and now he has let you cache them, so that we have nothing to eat. He cannot be strong or he would care for his people. He must be part devil. He has done nothing for us. We are poor and foolish. We know nothing and can do none of the things that the white man knows. We do not even know how to farm and make things grow. As long as we had the buffalo and plenty of ground we did well, but our god has let you take away our country and cache the buffalo and now there is nothing left to us. When the buffalo went away we were hungry. The agent had nothing for us to eat, and we starved. One-quarter of the people died. We knew, for we kept the count, and whenever a person died the chief of the band cut a notch in a stick, and when spring came the chiefs took these sticks to the agent and he counted them. The people who starved to death were mostly the young and the old. The little children wasted away. They had no strength to fight hunger and the weakness that comes with it. Their arms and legs grew small like my finger and then they died. The old people had nothing at all to eat, for those who were young and strong took from them what little food was given them by the agent. So they drew their blankets over their heads and waited, and one by one they went to the Sand Hills. That winter there were many dead persons. Out on the bluff south of the stockade you can see many graves where the bodies of those who starved were placed after their shadows [souls] had started for the Sand Hills. There were not trees enough on all the creek to hold the burial scaffolds, so many died."

II.—AGENTS AND THEIR WARDS.

When Major Allen, the present agent of the Piegans, reached the agency in March, 1884, he found matters there in a most deplorable condition. The man who had been his predecessor had represented in his reports to the Indian Bureau at Washington, that these Indians had eleven hundred acres of land under cultivation, and were practically self-supporting. As a matter of fact there were about forty acres of land broken, on which had been raised the previous year a few oats. Just what the object of this false report was cannot of course be known, but it is supposed that the man wanted to make a good record for himself at Washington, and hoped that by carrying on his agency in an economical way he would retain his position for a long time. So he reported 8,000 Indians at the reservation—when the real number was under 2,500—and that they were practically self-supporting. His last estimate for provisions for the ensuing year called for about enough to feed the 2,500 that he had there for three months.

Up to the summer of 1883 the buffalo had been sufficiently numerous to feed the Indians, so that they were by no means dependent on the supplies issued to them from the agency, but that summer the buffalo disappeared, and they had to depend entirely on the Government supplies. These being wholly insufficient, they turned to the smaller game of the prairies, and killed almost all the deer and antelope on the reservation. Fortunately it was a great berry year, and the women collected and dried a crop of these fruits far larger than is customary. It did not take long to clear the reservation of antelope and deer. The prairies were scoured, and the crecks and ravines so thoroughly hunted that, by the time winter set in, almost all the wild meat that was within reach had been captured. It is true that there was a little game in the mountains, but the Piegans are essentially a prairie people, and never hunt in the mountains if they can help it. They are afraid of them because they know that bad spirits hide among the peaks, and there are many bears in the timber. Really then during the winter they had nothing to eat except the berries which they had dried, and the scanty supplies issued them from the agency. These were at first half rations, but as time went on even this issue was reduced, for the agent cared little about the sufferings of the people, but a great deal about making his supplies last to the end of the year. Toward the end of the winter he was removed, and shortly afterward Major Allen reached the agency.

He had heard rumors of the suffering among the Piegans, and when he reached Helena these rumors were confirmed, and he telegraphed the facts to Washington. Continuing his journey he reached the agency, and there was informed by his predecessor in office that the Indians had plenty to eat. Their wretched condition could not long remain a secret, however, and the new agent began an investigation for himself.

The story of the frightful suffering which he found among these hapless people is most heartrending. They were dying, literally of hunger, at the rate of from two to six each day. In his attempts to find out exactly what was their condition, Major Allen one day went into twenty-three houses and lodges to see for himself just what these Indians had to eat. In only two of these homes did he find anything in the shape of food. In one house a rabbit was boiling in a pot. The man had killed it that morning, and it was being cooked for a sick (starving) child. In another lodge the hoof of a steer—the hoof mind you, no flesh nor skin, only the hoof—was cooking, to make soup for the family. Twenty-three lodges Major Allen visited that day, and the little rabbit and the steer's hoof were all the food he found. And then, as he told me with tears in his eyes, "I broke down. I could go no further. To see so much misery and feel myself utterly powerless to relieve it was more than I could stand."

From the time of his arrival he had been telegraphing to Washington the condition of affairs, but help was slow in coming. In the first place, the wheels of the Government are so tied up with red tape that nothing can be done promptly; and in the second, the lying agent who was the cause of all this misery had gone on to Washington and was busily engaged in contradicting all the reports made by Major Allen. Happily help was had nearer at hand. The noble people of Montana and the army officers stationed at Fort Shaw did all they could to get supplies to the sufferers. One or two Montana contractors sent on flour and bacon on Major Allen's personal assurance that he would try to have them paid.

But oh, how long it took to get the supplies in over the roads, sometimes hub deep in mud and again rough with great masses of frozen clay. And all this time the people were starving.

Major Allen had calculated with exactest care the supplies on hand, and was at this time issuing one-seventh rations. The Indians crowded around the agency buildings and begged for a little food. Mothers came to the windows and held up their starving babies that the sight of their dull, pallid faces, their shrunken limbs and their little bones sticking through their skins might move some heart to pity. Many a woman brought her young daughter to the white men in the neighborhood and said: "Here, you may have her, if you will feed her; I want nothing for myself; only let her have enough to eat that she may not die." One day a deputation of the chiefs came to Major Allen and asked him to give them what he had in his storehouses. He explained to them that it must be some time before the supplies could get there, and that only by dealing out what he had with the greatest care could the people be kept alive until provisions came. But they said: "Our women and children are hungry and we are hungry. Give us what you have and let us eat once and be filled. Then we will die content; we will not beg any more." He took them into the storehouse and showed them just what he had, how much flour, how much bacon, how much rice, coffee, sugar and so on through the list, then he told them if this was issued all at once, there was no hope for them, they would surely die; but that he expected supplies by such a day. "And," said he, "if they do not come by that time you shall come in here and help yourselves. That I promise you." They went away satisfied.

Meantime the supplies were drawing near. The officer in command of Fort Shaw had supplied fast teams to hurry on a few loads to the agency, but the roads were so bad that the trains moved with appalling slowness. At length, however, they got so near the agency that it was possible to send out light teams to meet the heavily laden ones, and bring in a few sacks of flour and bacon, and every little helped. Gradually the suffering was relieved, and now for many months the Indians have had plenty, but the memory of that awful season of famine will never pass from the minds of those who witnessed it.

There is a record of between four and five hundred Indians who died of hunger at this time, and this includes only those who were buried in the immediate neighborhood of the agency and for whom coffins were made. Probably more than half as many more died at some little distance in the camps on other creeks, but this is mere conjecture. It is no exaggeration to say, however, that from one quarter to one-third of the Piegan tribe starved to death during that winter and the following spring.

For all these deaths one person is responsible; the agent who preceded Major Allen. He starved from five to eight hundred Piegans within a year. Not many people can boast of having made such a killing. But nothing was ever done to him. He still lives; possibly honored and respected. What would be the feelings of a man of ordinary sensibilities, who was responsible for such a deed? In these days we have no form of punishment which is adequate to such a crime. Civilization has decreed that death is the punishment for the murder of a man, and for the murder of five hundred there is nothing more severe. In the good old days it was not so. There were the stake and fagots, the red hot pincers to tear the flesh from the bones, the wheel and bar, the kettle of boiling oil. We have outlived the days of such punishments, but not of the crimes to which they were applied. It is a pity.

Too much cannot be said in praise of Major Allen's wise and humane management during this most trying time. He showed himself indeed the right man for the place. By means of his unflagging energy he succeeded in arousing the Government at Washington to speedy action, and in securing the co-operation of the people of Montana at the time when their assistance was most needed. Moreover, his representations to Congress were so effectual that he secured an appropriation, which, for a year, places the Peigans beyond the reach of want. He has shown a combination of humanity, good judgment and energy, which is very rare, and he deserves and will receive for his treatment of this miserable remnant of a great people the thanks of the whole country.

Yo.

[In connection with Almost-a-Dog's story, Mr. Schultz's Life Among the Blackfeet, FOREST AND STREAM, Vol. XXI., should be read.—ED. F. & S.]

The Sportsman Tourist.

AN OFFING.

AMONG the many interesting and satisfactory traits of men illustrated in FOREST AND STREAM, are some commoner, we have faith to believe, to men of a bent for outdoor life than to those who have not the disposition. However much we err in this general proposition, at any rate, not long ago, yielding we will presume to the importunate demand of its followers, the FOREST AND STREAM gave a large part in its columns to rehearsals of "unsuccessful expeditions." Whoever heard of "the like of this" before? Where is there another paper having a constituency of sufficient simplicity and originality, or whatever you chose to call it, to ask a place to tell and hear of each other's failures? Who did not read, with fascinated admiration the yarns of these sons of the air and the woods? Perhaps the contributions from the West, whose boast is its simplicity and freshness, were not so much to be marvelled at, but that the "effete civilization" of the East, the knickerbockered, dainty-handed triflers with exquisite guns and rods, self-conscious, proud and uncommunicate, for so the popular idea goes, should find its responsive chord to this tune was somewhat of a surprise. All this may seem to have little point unless it prove the labored introduction to an account of some "unsuccessful expedition." But the unfortunate reader must be reminded that after unstinted praise of these authors it would hardly do to appear on the spot in the same role.

To be sure we took along guns and rods, but who could be looking much for bass along in October or "food for powder" in such fair weather as we had. Like young geese, which a local wit used to cite in the spring, we felt that we wanted to fly and that was all.

We were an open boat, three boys, one of them the real thing and two of older growth, an oarsman, a canvas covering, old clothes, coffee, potatoes, bread, pork and butter and camp utensils of the primitive kind. It was early afternoon before we went aboard and worked well into our fine "white ash" breeze that skirted us up along the shore resplendent in the golden red and brown of autumn foliage. Off on the horizon black lines of flock ducks swept the blue and quiet water toward some night shelter. "In vain the fowler's eye did mark their flight to do them wrong." A tribe of impudent coots and fish ducks dove, reappeared and bobbed around successfully, luring us to unsuccessful shots. The light wind went down with the blazing sun, and cool shadows fell across the country before we could land and make camp on the shingly beach, seven miles from town. Our boat was hardly hauled out and backlogs, forestsicks and lightwood enough for the fire brought in before twilight had said "good night." And good night it was.

Supper done for, the shelter of the upturned boat, its cushions and "the weed whose clouds all other clouds dispel" trimmed the occasion. We saw the stars light up their lights. Venus soon sloped over the Western threshold of our world. In the north Charles's Wain began for us its slow circuit, and aloft gleamed the stars of Cassiopeia. Later on, in the east Aldebaran's ruddy lamp moved up the sky and the Pleiades "glittered like a swarm of fireflies tangled in a silver braid." An air off the land rustled amid the neighboring trees and slid out over the lake. Miniature waves broke on the pebbly beach as if muffled to help keep the reign. Even the shrill crickets failed to mar the harmony, and the intermittent note of some late whippoorwill in a distant wood marked the gentle measure.

Wrapped in blankets and creeping closer under the shelter of the broad boat, we saw the fire burn down to embers; and at length sleep, won without any wooing, clasped us in comfortable embrace. Twice or thrice during the night the dark shadow of a companion—self-appointed and faithful stoker—feeding the dying fire to a grateful warmth, breaks the thraldom of our senses and we wake for long enough to hear, perhaps, the brief twittering of a dreamy thrush.

What weather we did have as we vagabonded along shore! Mornings whose sunrises dispelled the usual owliness, and days whose air "sparkled like champagne."

We trailed our flies up and down over the shelving bottoms of the shore and idly contemplated their many-hued pavements of glistening stones and their gardens of seaweed, but we hooked no bass. We sat our expensive decoys on "plashy brinks," among succulent lilypads and tempting reeds, and we scoured the heavens from green coverts for the foolish quarry. We saw the water hen run in and out and the cackling blackbird fly back and forth; we heard the squawk of a woodduck domiciled away up the creek and the bleat of a busy snipe somewhere about, but we bagged nothing. More than one day, always hungry and tired, we toiled home to our grateful habitation empty-handed.

One day broke gray and windy. Great rolls of somber clouds, the "gray and formless daughters of the air" that haunted Heine's castaway, journeyed across the sky. Vessels reeled along far out from shore under storm jibs and reefed foresails, with dropped peaks. The grasses of the marsh pulsated violently at the angry puffs, and trees bent supplicantly to the blast, scattering prodigally with it their dry leaves. Noon and afternoon the storm grew, until at dusk the angry breakers thundered their volumes of water on the beach as if in ferocity at having missed some prey. At their command we moved our roof and boat together out of the maw of their dark swirl and trouble. The searching wind clean swept great embers from our huge fire of logs, and shot their sparks away like meteors, to be quenched in the hissing foam, or to go out in the upper air.

It rained that night. But the boat had turned more water than that, and in rubber coats and on rubber blankets we did as they do in Spain when it rains. At length the lashing of the water by the wind and the roars and cries of them both ceased to impress our tired sense. But curiously enough our time was up the next day and our outing ended. Proudly we met our friends in town and reported in triumph the utter barrenness of our hands. They eyed us suspiciously, winked knowingly one to the other and crossed the street. Poor, untaught things! They read not the FOREST AND STREAM. They grope in the darkness of thinking that man lives by bread alone. They dream not that there is more in the philosophy of hunting and fishing than fat bags and strings of fish.

G. T. C.

OSWEGO, N. Y.

A WEEK ALONG THE GULF.

ON the morning of March 3, 1885, one standing in the business part of Tallahassee, Fla., might have noticed a light wagon with three persons, two young men about twenty-five and a negro boy of twelve. They were off for a week's trip to the Gulf of Mexico for fishing and hunting. The elder of the two was Dick Carpenter, of Tallahassee, who enjoyed nothing better than a week off with his rod and gun; the other was a vandal from the Florida University, who had accepted Dick's invitation for the purpose of adding some new specimens to his collection in ornithology.

The morning was all that could be desired. It was such a morning as has made Tallahassee famous all over our country. Mocking birds were singing in every treetop and the air was laden with the perfume of flowers. A half mile out of town a small pond is passed which contains a flock of forty ring-billed, black-headed ducks. It is an easy matter to kill them, but to get them out is another question. After considering the matter we leave them to enjoy their morning bath undisturbed. The road now enters an immense yellow pine forest, which appears almost void of animal life. Four miles from town we pass through the little village of Bellaire, once the residence of rich planters, but now almost deserted. Here may be seen the old plank road running from Tallahassee to St. Marks, over which the cotton used to be transported. There are no houses now for ten miles, but it is a delightful ride through the immense pine forest. Next we come to the natural bridge across the St. Mark's River. Just before crossing the natural bridge the traveler's eye is attracted by strong lines of entrenchments thrown up during the late war. But now the scene is somewhat changed, for a church has been erected within one hundred feet of the breastworks. A mile further on is the residence of Mr. Frank Hall, who is to accompany us to the Gulf. Mr. Hall has the reputation of being one of the best shots in Florida, and keeps a small armory of heavy and light shotguns, rifles and shotguns combined, and even old muskets and navy revolvers.

Our craft is 16 feet long and and 4 feet beam amidships, and is rigged with an 18-foot sail. Promptly at 3 o'clock the boat leaves the landing and her prow is turned toward the Gulf. The tide has just turned toward the sea, twenty-five miles distant. The St. Marks at this point is one of the most beautiful streams in the south, the water is deep and clear and teeming with fish and game. The banks are covered with a dense foliage of cabbage palmetto, magnolia, cypress, and immense numbers of semitropical plants with foliage so dense that a person's gaze cannot penetrate far into the vast gloom beyond. Here the wild turkey and deer are abundant, and occasionally a bear is killed. But the game is fast diminishing, as every winter brings a greater array of sportsmen from the North, who with the local hunters are fast exterminating the game from this favored region. The Legislature of Florida affords no protection whatever to the game within her borders, so that any one can with impunity hunt at any time without fear of the game laws. As the boat passes down the stream a pair of pileated woodpeckers fly across the river just ahead and are soon busy at work on an old dead pine. A little further on a mocking bird ceases his song long enough to dart into a tree where half a dozen cardinal grosbeaks are feeding on berries, and darting first at one, then another, he scatters them in all directions, then returns quietly to his perch and song. This is a favorite prank of the mocking bird, as he seems to have a deadly hate of the beautiful cardinal. From a tree overhanging the water a pair of red-tailed hawks start with a shrill scream. A number of ospreys are flying up and down the river. A red-shouldered hawk is perched on a tree near the water, and occasionally small flocks of ducks are seen on the surface. Most of them are widgeons; and there are also large numbers of coots, cormorants and grebes. The Izaak Walton of the party suggests trying bobbing for trout, and after fastening the spoon to the line hands it to the "Vandal," who after a half hour's trying to get a rise gives up and passes the line back.

We are now near the little village of Newport, which, like Bellaire and St. Marks, were thriving little business places in earlier days. Mr. H. takes a large conch shell from the bottom of the boat and blows it to call old Reuben, the cook, who had gone in advance of the party with cooking implements and fishing tackle. Reuben is a stalwart negro about 75 years of age and very active. He is in the habit of making frequent trips to Newport to see a dusky maid somewhat his junior, and on this occasion, judging from his beaming countenance, he must have been very successful in his wooings. A mile below Newport several large bald eagles passed down the stream, and as night approaches a number of owls begin to tune their voices along the river. About a mile above St. Marks the party encamp for the night. At 4 in the morning Reuben is astir and soon has breakfast ready and the party are not long in getting their boat afloat as the tide is running out rapidly. A little way below St. Marks stands the old Marine Hospital with its stone walls, and surrounding it are numerous breastworks, thrown up during the rebellion. Two miles further down is the site of old Port Leon, now deserted on account of high tides sweeping over it. As we pass down the river the woods on the banks disappear and tall rushes and sawgrass taken their place. Numerous gulls, terns and other sea birds are becoming more plentiful, and the St. Marks lighthouse is in full view. As the boat emerges into the Gulf a large flock of brown pelicans are busy fishing, plunging from the wing with great force into the water and splashing it many feet into the air. The boat grounds on one of the many oyster bars at the mouth of the river and it is the work of half an hour to get her afloat again. A number of Florida crows are feeding on one of the bars.

The destination of the party now is the Pinhook River, about twenty-five miles distant from the lighthouse. After exploring two or three streams, which proved to end in ramifications in the marsh, we finally enter another stream, broader than the first. Darkness is approaching very fast; all are tired and hungry, but it is out of the question to land, as the shore for several hundred yards is covered with a growth of rushes and sawgrass no boat can penetrate. Reuben in the meantime keeps up an incessant grumbling to his boat, and is beginning to think the Pinhook River is a myth. Mr. H. now says the only hope is to reach the Ancilla River and ascend it. After hours of groping about in the darkness and running aground on oyster bars a number of times, the Ancilla is reached and ascended for six miles, where a good camping place is found and supper soon ready. The watches, however, indicate 12 o'clock. Of course no one is hungry. Men used to regular meals are not apt to be after being tossed around for eighteen hours in a small boat. Nobody smokes more than two pipes after supper, but all are soon stretched under the friendly palms and dreaming.

Next morning the sun is several hours high when we are astir, and after breakfast Messrs. Hall and Moore take the small boat and set out once more to find the Pinhook River, leaving the rest of the party to amuse themselves as best they can. Mr. Carpenter and old Reuben try fishing for several hours, but the fish are not inclined to bite and Reuben says, "This heah Ancilla ribber nebber was no good for fish, nohow." The Vandal with his gun is following the birds around the woods, but like the others of the party is doomed to come in empty-handed, save for a pint of small sea shells. Just across the river a pair of ospreys are very busy repairing an old nest that has evidently been used for many years. About noon Hall and Moore returned, stating they had found the Pinhook and a fine dry camping place, about six miles distant. After a hasty dinner camp is broken once more and the party soon embark to go to this famous hunting ground. Passing down the stream several more large bald eagles are seen, and on a small island in the river about fifty buzzards are quarreling over the remains of a large alligator, denuded of his skin by the alligator hunters. The mouth of the Pinhook is soon reached, and after a hard pull of four miles against tide the party come to a place where the river seems to issue from the earth; one hundred yards further on it again appears and forms a circular pool fifty feet in diameter, in which the water boils like an immense caldron. The river through its entire course from this point seems part of the time beneath the surface, forming many natural bridges on which large trees of pine, cypress and palmetto are growing, and so proving that these bridges have existed for ages. By the time everything is in readiness about the camp and a comfortable tent of palmetto leaves is built darkness has once more spread her mantle over the earth.

Thursday morning all were astir early, and after breakfast Messrs. Hall, Moore and the Vandal took their guns and went out. In these Florida swamps the foliage is so dense that the eye can only penetrate a few feet ahead; add to this the numerous briers entwined among the heavier trees, the mud and water at times half waist deep, with sawgrass and rushes higher than your head, and you have a fair idea of what the trio had to contend with. If the jungles of Africa or India are any worse I pity the man who attempts to pass through them. The three returned about noon empty-handed and thoroughly disgusted with the prospects for killing game. Deer are evidently abundant, as their tracks can be seen everywhere, even within 200 yards of camp, and the hunter who comes here when there is not so much water and mud to contend with can presumably make a good bag of game. On returning to camp Mr. C. and old Reuben had an out-line all ready to put in the river. The Vandal on looking around discovered a bald eagle's nest in immense yellow pine 300 yards from camp, and a bald eagle was seen to leave the nest. We laid under the palmettoes near by, when she soon returned and was shot dead by the Vandal, who had been trying in vain for ten years to procure a specimen of this kind. In a few moments the other eagle is seen coming from the sea with a large fish in his talons. He evidently expects mischief of some kind, as he utters several piercing screams as he descends toward the nest in a spiral column. He is not long in coming within reach of the 10-bore. Unlike his mate he does not fall dead to the earth at once, but flies part reeling several hundred yards and pitches head first into the swamp. The three go to the spot and search through the tall grass for several hours, but are obliged to give up and return to camp with but one, which was made into a neat skin and packed carefully away. It was a female in adult plumage and measured six feet six inches from tip to tip. The party returned to the nest and cut down the

tree to secure the two young. The nest was 100 feet from the ground and the fall killed both young which were only a few days old. In the nest were found half a dozen fish over a foot long. The young were carefully made into skins to decorate a cabinet at some future day. There are several large pileated woodpeckers about camp, but they are very wild and will not let a person approach in gunshot. At night the party are again serenaded by such a chorus as can only be organized in some of the Southern States by owls. In a council of war around camp that night it was concluded to break camp the next morning and start for home, and return sometime in the future when the swamp would be drier so as to make deer hunting a success.

The following day at 9 o'clock the two boats were again moving out to sea with the tide. The Pinhook proved a very treacherous stream to navigate at low tide, full of oyster bars and large rocks near the surface, and at other spots there appears to be no bottom. The winds on the homeward trip were as contrary as they had been coming, so that at sundown the party had just reached the mouth of the St. Marks River, which they ascended to Port Leon, and by carrying the camping outfit quarter of a mile they found a dry place to camp under a large pine tree. The moving required two trips each to the man. The next day, after a pleasant sail up the St. Marks the party arrived at Mr. Hall's landing about sundown. The Vandal had got out four miles down the river and was looking for specimens, as usual. His gun was heard to crack a number of times, but at the landing he could show only one barred owl. Reuben had now got out of the "power of misery" he had been in for several days, and on passing Newport had even sung snatches from songs. On nearing the landing he was heard to say to his boat, "Jess look at you now, you kin run all right when you knows you's mos' home."

While seated around the bright fire that night in Mr. Hall's comfortable residence it was easy to note the contrast to camping on the Ancill, Pinhook or even Port Leon. But best of all was the bed so clean and soft when compared to the ones around the camp-fire. Next morning two of the party imagined they heard quail in the fields close by, and they soon started several fine coveys without the aid of dogs. Nowhere in the country can the quail be found in greater numbers than about Tallahassee. Later in the day Mr. Hall hitched to his two buggies and started for the city. Just as the night was beginning to fall the Tallahassee hills could be plainly seen, and very reluctantly two of the party went back to the hum-drum of every day life. VANDAL.

HUNTING IN THE HIMALAYAS.

Lights and Shadows of an Indian Forester's Life.

VII.

I AM back again at the bungalow after a three weeks' absence up river, and am devoting every alternate day to office work, having been compelled to allow some arrears to accumulate, after I moved my camp a second ten miles further. There has been a fair amount of exciting incident in the Division since my last budget, and to begin with the most interesting topic—the man-eater—the Ghorrkas succeeded in getting a good shot at him, and have wounded him badly, if not fatally. Their time was nearly up, for they had to report themselves to their commanding officer on the thirtieth day from that on which they got leave, when the corporal or Naik took his party to join the other four, and report themselves to me for departure. After a walk of twenty miles they reached a forester's post, and prepared dinner, and while still at it, a lot of bamboo cutters came rushing into camp, with a report that one of their number had been carried off by the man-eaters. Sending word to the other party to join them at my camp the next evening they set off for the scene of the daring marauder's latest outrage, taking the bamboo cutters along with them. Arrived at the spot these latter were instructed by the corporal to recommence operations, while he and his party followed up the blood trail.

After about a mile's walk, which occupied them nearly an hour, for they paused at every five yards to keep a good lookout behind and on both sides as well as ahead, they came to a ledge of rock some three feet high, from which the ground hollowed away again to their right. Here the crunching of a bone was distinctly heard, and the naik dropping on his hands and knees and peering over, got a full view of the beast, greedily devouring her victim at about eighty yards off. Stealing back he whispered his orders with quiet precision All four advanced on their knees to the commanding point, he and another would reserve their fire while the other two fired and reloaded. Quiet as they were the tiger heard the whispers, for they had scarcely looked over before they saw him stealing toward them on his belly. The instant eyes met the beast rose and charged forward a few steps, growling savagely. "Keep steady and let him come closer," said the naik, but the beast was not disposed to charge home and came to a stop at fifty yards. "Fire," said the naik, and ping-ping went the two rifles, the men falling back and reloading with true Ghoorka coolness. A cry of rage from the tiger which bounded away. Again came the order to fire and another shot rung out, but the naik being unable to cover the brute held his fire. As soon as all were reloaded, which was the work of a few seconds, they started in pursuit and were at once gladdened by coming on blood which they tracked into some bush cover, where they found it on the leaves at nearly three feet from the ground, and inferred that the beast had been shot in the throat or high up the chest, but crossing a sandy nullah, they observed that the beast limped on one forefoot, sometimes carrying it, and as it was a front shot, there was no doubt the ball had lodged between the shoulder and the chest.

In this nullah there was some long grass cover, and as it would have been foolhardy for men afoot to follow a wounded tiger into this they returned to their camp, and sent a special messenger to me. The fellow, with a comrade picked up at the last station, got in about seven o'clock, while we were at dinner. The elephant was ordered immediately, a few bottles of beer and a supply of eatables were stowed in the howdah, and taking with us a couple of rugs Charley and I set off, reaching the Ghoorka camp at one in the morning. Charley was so anxious to join us that I did not like to refuse. I told him I must of necessity take one of the Ghoorkas with me, and that if he went, he would have to share the back seat of the howdah with him, but fortunately on arrival at the station we found Gorind Ram there with his elephant, and this squared the difficulty. Giving orders to have a quart of milk boiled at daylight, we stretched ourselves on our *charpoys* (the Oriental fourposters that the Jews used to take up and walk away with) and got a few hours sleep before we were summoned. A bottle of coffee essence with the hot milk made no bad substitute for the usual coffee, and this disposed of, we were in the howdahs and away long before sunrise.

We reached the nullah in which the trail had been lost in about an hour and a half; there was a long strip of high grass (fourteen or fifteen feet), but it was nowhere more than twenty to twenty-five yards wide and easy beating for two elephants. We beat upward first and got to the end of the grass in half a mile without any sign, and then turned and beat downward; some of the grass clumps were heavy but we meant business and took our time over them, turning and going through them again and again, and in two or three cases we set the elephants at work with trunks and tails and leveled the thickest of it. The whole nullah was not more than a mile and a half in length, but it took us nearly three hours to beat it, and the end of it was disappointment, modified by the fact that it terminated in a dry creek with a narrow strip of long grass on either side and about a hundred yards of bare gravel bed between. We turned up the creek, taking the long grass on the right bank and had not got more than twenty yards when my elephant gave signs which, being interpreted, meant that a tiger was passing us at close quarters. I called to Charley to keep a good lookout, and the next moment Stripes broke cover au my side, making straight across the creek. I had picked up my smallbore, which, being a good ball gun, I preferred to my rifle for sharpshooting, and when the tiger was about thirty yards off I got in a ball in the saddle which made him wince, but with a growl he turned sharp round and charged straight down on my elephant. Charley was by this time abreast of me, and three or four shots rang out nearly simultaneously, one of which hit him on the quarters and brought him down on his haunches, but before I could pick up my rifle he had again turned tail and was making across the plain. His pace soon slackened; there was considerable firing, but I saw he was coming to a stop and reserved my fire for close quarters. Presently he staggered and fell over on his side, rallied to his haunches again and sat up for a moment, and again fell over. He was done for. Coming up to him I gave the word not to spoil the skin, and finding that the beast's efforts to sit up were ineffectual, I told the Ghoorka to jump down and give him a ball in the ear. This was done, the tiger responded by wagging his tail, and in a few minutes the writhings were at an end.

Was it the man-eater? There was no stagnant blood from yesterday's wound visible as she lay—it was a tigress—nor on turning her over did we find the looked for evidence. Two balls had penetrated her, one in the saddle and one on the top of her quarters, both close to the back bone. There was a slight scar inside her forearm, and another ball had entered just above the hock. These were all fresh and there were no other holes in the skin. It was not the beast wounded yesterday—ergo it was not the man-eater.

It was now about ten o'clock, and I determined to continue the quest until noon, so going back to where we had started the game, we recommenced beating, coming immediately on a half-eaten pig. We beat upward for a couple of miles, and then back down the other side, but beyond a few hog deer we saw nothing. We then gave in for the elephants' sakes, and sat down to breakfast, after which our Ghoorka took off the tiger's skin, and I cut open the stomach to find, as I expected, boar's bristles, but no human hair; the older refuse of the lower gut was also examined, and yielded only deer's hair. The man-eater had beaten us again. If dead he would have been in the nullah to which he was traced yesterday, but he had evidently had strength to get away, and was probably not mortally hurt. We went back to camp, gave the elephants an extra allowance of raw sugar, and the next day Charley and I returned to Boksar, where I found a letter from the chief telling us to expect him in about a week.

The Ghoorkas came in in the evening, and I gave them a letter to their commanding officer, to the effect that they claimed to have wounded the beast, and that I would consult with my chief about the reward, which would certainly be given if there were no repetition of his depredations.

The next morning Charley returned to his firelines, and I sat down to my office work, and was listening patiently to a petition, when I heard excited voices outside, and the next moment a chuprassee and a couple of wood cutters made their appearance, and gave the exciting announcement that the Chota Sahib had been mauled by a tiger. "Where is the Sahib now?" I asked. "He is in the camp with the wood cutters," was the reply. "Can he walk?" said I, again interrupting the story. "Yes, Sahib; that is a little." "Send off eight men with a charpoy at once, and put the Sahib's bed clothes on it," was my first order. My next was to have my pony saddled, and while this was being done I got out some brandy, a pot of healing ointment (no sportsmen should be without it), cut some bandages from a linen shirt, took my rifle, strapped on a cartridge pouch, and in five minutes I was galloping up the valley, and soon left behind the party with the charpoy, who were running on at a steady jog trot. The distance was about five miles, but I was soon there, and found Charley sitting in the shade of a big tree against which he leaned.

"Where are you hurt, old man?" I asked as I sprang from the saddle.

"Here," said he, pointing to his left shoulder. "It isn't much," added he with a turn of humor; "the beast tried to eat me but didn't appear to like it, and dropped me at the first taste." But it looked bad; his coat and vest were clotted with blood.

Ram Buksh began a story, but I cut him short at once. "We'll attend to the wound now," I said; "the story will keep."

Cutting off his coat and vest, and telling Charley as I did so that his charpoy would be up directly, I saw blood trickling down the breast from the shoulder, and ripping up the shirt sleeve a moment's inspection showed what was the matter. The tiger's fangs had penetrated the shoulder to the bone before and behind, but without any laceration of the flesh or broken bones. Calling for water which was quickly brought, I mixed some brandy in it which Charley drank, and then dipping one of my bandages in water. I washed the blood away from chest and back, cleaned the fang marks, from which a little blood still oozed, and then asked Charley if he had no other wounds or scratches. He said he believed not, and wanted to tell his story, but I told him to keep quiet for the present, for I was sure it was a good story that would keep, and that he would be able to tell it with gusto in a day or two. I then got in a plug of the ointment in each of the fang marks, smeared a good coat of it over one of the bandages, and soon had the wound bandaged up. Charley tried to make light of it, but he was a good deal shaken, and looked rather like fainting before he took the brandy and water, but what astonished me most was that there was no clawing visible. The blood on his clothes had not come from the shoulder wounds. It was perhaps the tiger's.

Looking round I got sight of Charley's sun helmet, which accounted for one paw. It was a military helmet with a spike on top and two steel bands inside crossing each other under the spike. The helmet was battered and the steel bands were curved backward and driven outside the helmet. These were signs that the beast had charged in front, brought down his paw on the helmet with force enough to crush a skull, but the springs had broken the force and rendered the blow comparatively harmless.

"That saved me," said Charley, seeing me examine the helmet. "I am afraid I shall have to buy a new one."

The men now came up with the charpoy. Charley took another pull at the brandy and water, which I took care not to make very strong, said he felt much better, and rising with my assistance, I was glad to see that he walked quite easily to the charpoy, where with a sheet thrown lightly over his shoulders and his head on the pillow, he was quite comfortable. A party of fresh men picked him up, and the relay running alongside, he set out for camp.

I then mounted my pony and called Ram Buksh to walk along with me and explain the occurrence, "but first," I said, "tell me, where is the tiger now?" "He is gone right down to the lower valley, Sahib, and badly wounded. You can see the blood trail at every step through the grass, and he just trotted down slowly; all the men saw him." Ram Buksh tried to ramble off and tell his story, but I cut him short, and told him to give me simple answers to my questions first, and in reply to them I learned that they had seen a tiger come over the hill and enter a small clump of low grass (a fairy ring) in the forest. Charley had at once taken his rifle and handed Ram Buksh his smoothbore, both barrels loaded with ball; that on making the grass the tiger sprang out at Charley; both fired. Ram Buksh ran behind a tree, and looking out, saw Charley down and the tiger on him. His first impulse was to run for assistance, but not caring to expose himself to view, he selected the next tree in line; then, turning for another look at the tiger, saw him rise and move off He had tried to cover the tiger from where he stood, but was afraid of shooting the Chota Sahib, as it was about fifty yards off; and he did not fire at the tiger as he went off because he had but one barrel loaded and no more ammunition. All this was the result of a great deal of cross-questioning, and satisfied me that Ram Buksh had been unnerved by the charge and had left Charley to fight the battle single-handed. He was hardly to be blamed that he had not the courage to stand and deliver his second barrel as the tiger bowled Charley over, and I said no word of reproach; but his conduct did not justify the account he was in the habit of giving of himself.

Overtaking Charley I jogged along with the charpoy, speaking little, for I saw that he was suffering from the excitement and shock, and on reaching home I got him on my bed while his own was being arranged comfortably, and then made him lie still until four o'clock, when I gave him some chicken broth followod by a dose of laudanum. He appeared in good, or at least, mirthful spirits, but I kept him quiet, and between six and seven the opiate took effect, and he slept till long past midnight, when he awoke somewhat feverish. This was no more than I had expected. There was no doctor near, the patient had a good sound constitution, not vitiated by excess of any kind, and I had no anxiety about his pulling through easily. The next morning I washed and dressed his wounds and then at his request took the elephant to go after the skin, but arrived at the camp I found Ram Buksh had been before me, and found the beast lying at the foot of the bank dead, just immediately below where he had disappeared.

I finished the story by Charley's account a few days later. The beast charged at him, paused at about five yards for a spring, and as he raised himself Charley fired and hit him full in the chest, which brought him to his belly, the next moment Charley felt rather confused in his head, and then realized that he was on his back, the tiger holding him by the shoulder, but keeping quite still. Lying there powerless he did not know how long (it seemed a long time), he wondered what would be the next act in the drama, and was conscious of a feeling of impatience for a change, when the tiger relaxed his hold and walked quietly away. The shot in the chest was the only mark we found in the skin, Ram Buksh had missed, and although he now pointed to a hole in the forehead as his *coup de grace*, he was silent when I told him it was waste of a cartridge. Charley is on his legs again, and resolved to pour in the second barrel the next time he drops a tiger at the charge. SHIKAREE.

FLORIDA PINES AND HAMAKS.

THERE is a theory that we are disposed to entertain with regard to why the greater portion of the State of Florida is covered with pine trees, which are evergreen, instead of deciduous, and other hardwood trees, the growth of which upon land in Florida causes it to be distinguished as "hamak," a distinction, so far as the original character of the soil is concerned, without a difference.

From various causes, frequently from lightning, often from carelessness and accident, and sometimes purposely by the owners of cattle, the wild lands of Florida are annually burned over.

The stock men resort to this means of getting rid of the tough, dry grass stems in early spring, and inducing a fresh and tender growth of grass for their half-starved cattle that have wintered on climate and wire grass in the open woods; but it is also true that the same practice was resorted to by the former Indian inhabitants, whose object was to furnish tender picking for the herds of deer, to induce these animals to leave the swamps and resort to the dry country.

The pine tree is propagated from seeds that fall from the cones late in the autumn. The seeds are provided with thin membranous wings, upon which they are blown by the winds and distributed over the land. The winter rains plant them. Early in the spring the young pine appears as a green spike that shoots up six or eight inches before its leaves begin to spread, after which it grows rapidly for eight or nine months. The green leaves of this young tree are practically non-combustible, and the only bud it bears is in the top of the tall stalk and thoroughly enveloped in a green coating.

When it is about ten or eleven month's old, the annual wood-burning takes place. Fire sweeps over the face of the pine region; every sprig of grass, every weed and every deciduous shrub and tree that has sprung up since the last annual burn, is destroyed. All the hard-wood growths have their eyes or buds distributed regularly along the stalks and stems, entirely unprotected from the fire, and as the growth of all plants of this character is slow in its early stages as compared with those of the pine, none gets far enough advanced in the twelvemonth to rise above the flames, and so they perish, while the young pine escapes with a severe scorching, which the bud survives. Thus, upon the principle of the survival of the fittest, the pine becomes master of the situation and sole proprietor of the woodland. But natural and artificial barriers are often offered to the progress of these forest burns.

Natural impediments consist of gullies, creeks, rivers or ponds, across which the fire does not cross when traveling before some prevailing wind. If the rainy season, which comes in the winter before the usual burnings begin, has been an exceptionally wet one, all depressed places become filled with water. These flats sometimes extend considerable distances in irregular courses. Imagine the woods on fire and the flames traveling slowly along the surface toward the southwest before a gentle northeast wind, destroying every vestige of vegetation not too much grown to be within reach. Suddenly it encounters a slight depression in the surface of the land, where stands an inch or two of rain water. This depression reaches perhaps in an irregular course for miles either way. It of course puts an end to the "burn." On the opposite side of this wet depression the little oaks, hickories, magnolias and bays, that have put up since the last burn, are not swept away this year, but get another year's growth. This first season's escape is enough to give these deciduous trees a foothold, and enable them to rear their heads high enough to escape complete destruction, even should no protecting water interpose the second year.

Here, then, we have an incipient hamak, making its beginning on sandy "piny woods" land, in no particular different from, or better than, that over which the fire has swept, and which remains pine land.

In a very few years, in this semi-tropical climate, this young orchard of hardwood bushes has become a pronounced hamak of spreading shade trees, whose shadows protect the originally poor and sandy soil from the summer's sun, and whose annual crop of castaway foliage tends year after year to add mould to the ground, which, under these two powerful fertilizing agencies, gradually changes from the original white saud to a dark, often black, loamy soil, as fertile as fertile can be. It is no uncommon thing to find such parcels of land in South Florida of wonderful fertility, possessing an upper soil of partially decomposed leaf mould several feet deep.—*The Florida Annual.*

THE ANTELOPE GOAT.

Editor Forest and Stream:

Rock and mountain-girt, Burrard Inlet, bowered amid the primeval forest, a cove within a cove of the silent, tranquil, far-away Pacific Ocean; in the foreground the dirty and unromantic Sywash paddling his canoe, in the background the great peaks of the Cascade range, at least on those rare occasions when they can be seen; isolation within isolation, solitude intensified, it is certainly not a spot from whence the emanation of deeply scientific disquisitions or even strictly logical or novel arguments based upon a knowledge of that science can with any degree of fairness be expected. How egregiously incorrect, however, this supposition is, is proved by the three letters from three inhabitants of this locality, the Messrs. Hughes, Fannin and Griffin, which you have lately published in your columns, and in which the chase, characteristics and genus of the so-called white goat is once for all described and definitely settled. Not only virtue, as the proverb has it, but also truth and deep learning can dwell in the modest Sywash-built log cabin lost in the primeval forest.

No doubt the world at large is perfectly satisfied with the accounts and classification of this animal contained in the above three letters. To me, to the ignorant wretch who once dared to write a poor little paper on this animal in the *Century*, and who has only paid five visits to the Puget Sound country (four being, it is true, entirely abortive ones on account of the peasoup-like dense smoke of forest fires that enveloped for months at a time the whole country, mountain goats and all, obliging me to retreat to other shooting grounds), and who only crossed the ocean thirteen times to shoot in the Rockies and Pacific coast; to me, I say, and perhaps also to some other poor dolts who have supposed that they knew something of this animal, these letters meant instantaneous annihilation. We feel weary, we feel tired with the gross extent of crass ignorance we have displayed. But not only to sportsmen, also to some so-called men of science (save the mark) such as Hamilton Smith, Agassiz and Spencer Baird, who have, without consulting Messrs. Hughes, Fannin and Griffin, dared to rank the "goat" as an antelope, Mr. Griffin's dictum thundered forth from the solitudes of Burrard Inlet that the animal is not an antelope; "that there is about as much of the antelope in the actions, habits and appearance as there is in a Government pack mule," must mean beads of anxious perspiration if no worse. Particularly creepy about the small of his back must Prof. Baird of the Smithsonian feel, for has he not placed on record in his "American Mammals" that the skull and other bones "show very clearly that the affinities are much more with the antelope than the goat or sheep? In fact, none of the more modern systematic writers place it in the genus *Capra* or indeed in the ovine group."

Mr. Griffin's letter published in FOREST AND STREAM of Aug. 27, must make many an old professional discounter of camp yarns of the tall, taller, tallest kind wince and scratch his head, but I think Mr. Griffin can, with safety, "stand pat." A royal flush, ace high, can not, as we all know, be beaten. To have such a rare animal as the white goat, so rare that only three museums in the world possess, so far as I know, stuffed specimens and not a single one a live animal; so hard to find that I do not believe more than six of England's most indefatigable sportsmen have ever killed it, to have, I say, such a rare guest come right into camp and "lie down within ten yards of the camp-fire," "anxious to watch the operation of cooking," is an event that deserves to be more widely known than even your columns can give it publicity. Mr. Griffin's feat repeatedly performed, as he assures us, of walking up "to within fifty feet of goats," of course in plain sight of them, "before they attempted to leave the spot," might be explained by the well-known extraordinary curiosity these animals exhibit. They naturally wanted to see what kind of a man this Mr. Griffin was. He further says, "I once got so close that I shot two of them down without putting the rifle to my shoulder," adding, "the first time I tried that style of shooting," words I think he must have borrowed from the man who, aiming at a sparrow, killed his mother-in-law standing behind the bush.

Mr. Griffin remarks that it is no uncommon thing for a Howe Sound Indian to kill twenty-five goats in a day with an old flintlock musket, the range of which is about twenty-five or thirty yards. Howe Sound adjoins Burrard Inlet, a circumstance which should be remembered by those who propose accepting the invitation extended by Messrs. Hughes, Fannin and Griffin to Eastern sportsmen—of course quite disinterestedly—for, considering that their hides (the goats', not the Eastern sportsmen's) find a ready sale at Victoria, Portland, and other neighboring marts, there cannot be very many left, or the Puget Sound Indians would be no Indians but a tribe of aboriginal Berghs. To many a good old hunter it will be news that the old muzzleloading Hudson Bay musket has only a range of twenty-five or thirty yards. I am no "experienced old hunter," and what is more I don't want to be one, but yet I have repeatedly seen game brought down by these very rifles at a distance of 150 or 200 yards, and what is more I have seen Winchesters and Sharps badly beaten at 100 yards by these very arms. I think natural history is more in Mr. Griffin's line, and this being the case his categorical denial of the measurement of the big Deer-lodge ram, concerning which I had collected the substantiating evidence of ten men who had seen the animal, would appear quite in place, only it would seem to me that his "I would certainly require some better authority than that which comes from 'the home of tall talk' before I would repeat it as a matter of natural history," shows some quite uncalled-for jealous fear. So far as I know, nobody dared to ask the infallible Mr. Griffin, the maker of natural history, what he would require and as to the size of the great ram those ten witnesses, good men and true, "pass"—and who wouldn't?

Mr. Griffin concludes his letter by a passage that exhibits a delicacy of wit, a Voltairian *penetralia mentis*, that is rendered all the more striking by the contrasting childlike innocence that blandly divulges and "gives away" the true *raison d'etre* of Messrs. Hughes, Fannin and Griffin's attack upon my humble self. It runs: "But it may be after all that we of British Columbia know nothing of the mountain goat, and that it has been reserved for an English sportsman who comes all the way from London sewed up [I quote original diction] by his metropolitan tailor in a fur sack, to teach us." To teach Messrs. Hughes, Fannin and Griffin? What a preposterously absurd idea!

One thing remains to be suggested; do not some other insolent sportsmen who have come all the way from London, such as their Lordships Southesk and Milton, Drs. Cheadle and Hector, Messrs. Burton, Lord, Murphy, Douglas, Williams, Jameson and a half dozen others, who have shot, or who have tried to shoot, the goat, deserve no less than I do that metropolitan tailor-made sack wherein to be sunk to the bottom of the Pacific Ocean's Bosphorus, *i. e.*, Burrard Inlet? W. A. BAILLIE-GROHMAN.

P. S.—It occurs to me that Mr. Griffin's allusion to that fur bag may not be understood by those who have not glanced over my paper in last December's *Century* or who are not acquainted with my little book, "Camps in the Rockies," in which reference is made to the usefulness of a fur-lined, waterproof sleeping bag, particularly when hunting "goat," when everything has to be carried on men's shoulders, either your own or others'. A bag of this description weighs seven or eight pounds, and is much warmer and far less bulky than twice that weight of blankets. I have used them at great altitudes in different parts of the world, and in America the idea has found many imitators, for its practicalness is obvious. I happen to write these lines while comfortably housed in this very bag, for in the absence of a tent and in the presence of a snowstorm there are worse places to get into while on a raid after goat. W. A. B.-G.

UPPER KOOTENAY, British Columbia.

FLYING SPIDERS.—Jamestown, N. Y., Sept. 27.—*Editor Forest and Stream:* Have you seen the spider fly? A friend told me he saw it to-day. Perhaps it were better to call it a spider balloon ascension. The spider passed over his head as he sat in the carriage (as he said) attached to a network, which was about one foot in diameter, by small threads of perhaps ten inches in length, passing from the spider to different parts of the netting, which floated in the breeze (which was very light) with no apparent change of altitude. I asked if he tried with his whip to cut the line stretched across the road, and he said "No, there was no tree near for a web to be attached to," and he watched it pass across the road and over the fence, and he did not know how far it did go. This is something I have never before heard of, though I have heard of their climbing to the tops of trees and throwing down a ball of web to go down on, or to jump down, spin the web as they fall, this forming a line to pass on from the ground to the tree top. Can you give us some light on the subject?—R. H. BURNS. [The flight of spiders has been described in former numbers.]

MIGRATION OF HAWKS.—Onondaga, N. Y.—The various species of hawks and their habits is to me an interesting subject for study. We live on a hill two miles southwest of Syracuse, N. Y., and from this point we have a fine view of the city and a vast expanse of country lying to the west, north and east of it. Thursday afternoon of last week my attention was called to a long line of hawks coming from the north, and as they reached a point directly over our farm buildings, they began to circle around, hawk after hawk joining the flock until they numbered twenty-four, skimming in gradually extending circles, bearing toward the south. They came and kept on coming until they formed a long line of birds extending from north to south as far as we could see. Their passage over lasted nearly an hour. We could not distinguish the variety, but thought they were redtail hawks (*Buteo borealis*).—G. ALBERT KNAPP. [Such flights of hawks are not uncommon in autumn, nor do they seem to be confined to any particular species.]

LOON'S EGGS.—While in Frontenac county, Ontario, Can., this summer, I was fortunate enough to secure two loon's eggs. They were laid in a nest of reeds and moss carelessly drawn together, on the shady side of a small wooded island in Long Lake. The bird is almost constantly on the water, and is a very poor land bird, seldom building their nest further than twenty inches to two feet from the water, as they are but clumsy walkers. The eggs are fine specimens; light olive in color, with dark spots over them, and measure respectively $3\frac{15}{16}$x$2\frac{1}{4}$ inches and $3\frac{29}{32}$x$2\frac{17}{64}$ inces.—J. LEE SMEDLEY (Dugdale, Pa., Oct. 9).

A HOME-SICK WILD DUCK. — Charlottetown, Prince Edward's Island, Oct. 8.—While out duck shooting years ago my dog brought to me unharmed three wild ducks from a very late brood. I took them home with the intention of rearing them. Two of them died shortly after, but the remaining one, after being kept in confinment until tame, was allowed to run with the common ducks about the place. Early last autumn it began to go away, at first for only a few hours, but the periods of absence gradually lengthened until at last I gave it up for lost. Imagine my surprise two weeks ago to find it again with the tame ducks, where it stayed a few days and again disappeared. Whether it has gone this time for good is a question that only time can prove.—FLAPPER.

Game Bag and Gun.

WHISPERS FROM THE WEST.

I ONCE knew a man intimately enough to borrow his dog. My friend had broken his leg, and as the dog needed exercise he loaned him to me. A new collar was made for the dog with his owner's name and address engraved thereon, and I took a cast-iron, kennel-riveted oath I'd fetch him back. My friend had purchased the animal from a noted dog handler, who had clinched the sale with the remark that "the man who could not shoot birds over Patsie was an extraordinary fool," or words to that effect.

Now, Patsie was an Irish setter, small in size, dark in color, famously well trained, but Patsie was a crank. "If he don't mind you," said my friend, "give him a liver pill, that fetches him, because Patsie is bilious at times." I got a box of Mandrake's and started for the West.

I had a lovely bitch along with me of Theo. Morford's strain, and both these dogs subsequently caused me serious grief.

The first morning, after I had reached my destination in Missouri, was clear and balmy. I took both dogs with me and killed sixty-four quail over them, and saw Patsie do both good and bad work. I never put a whip on him, but treated him with the utmost civility and kindness. At last about the middle of the afternoon I said to him, "Patsie, old sport, go thither and procure for me that defunct quail which fell before my unerring aim." Patsie gave me one look. Across the horizon there was a red streak like unto the setting sun. It was, I have since learned, Patsie. The prairie was too small for him. He was gone. What under heaven induced him to depart without saying "good bye," I cannot conceive. William Goldenbow Kippy, Esq., who carried the game bag and the whisky flask, looked at my brother-in-law, Mr. Miraculous Cadwalleder Kingsland, of Pennsylvania, and my wife's brother gazed with astonishment into the western sky. We then looked at each other, and after wiping away the tears which pattered on the dry prairie grass, discharged four guns.

"Ho! Patsie, old boy, yer needn't fetch the bird. I don't want him," I cried aloud.

"Does yar kum pack, Batsey?" ejaculated Mr. Kippy.

"Whet! Whet! Patse-é-e!" yelled the youthful scion of the ancient Kingsland family. "Hi! Here, Patsie, he-re." But Patsie was deaf to all persuasion and did not *hear* worth a cent. We then began the most scientific hunt ever entered upon in Missoura after a dog. (I may remark that the State appeared to have grown since I was there last year, and the old man's legs were shorter.) The hunt, however, was so terribly scientific that it resulted in our all getting lost. This was Thursday afternoon at 3 o'clock. It was very cold. We got into the frozen marsh, which Mr. Kippy's choice remarks caused to smell like the White Sulphur Springs. At times, after it grew dark, I thought I could discern a blue light shining like a halo around his head, but I may have been mistaken. But Mr. Kippy's utterances were vile. At last he became so entangled in a patent complicated Dutch oven oath that he lost the trail and got separated from us; while a little later my brother-in-law went splashing off into the dark and was seen no more. Nellie, my bitch, stuck to me like wax. She waded through ice and water after me until she became frozen, and then I had to carry her. I became desperate, plunged into the deep water, crossed the marsh and got home at 10 o'clock that night. Mr. Kingsland struck the house at 7 A. M. next day and William Goldenbord Kippy, Esq., fotched up at 9 A. M. Although I did everything I could for my poor bitch the terrible exposure was too much for her and she died two days later and was buried on the prairie. Because I do not interpolate here a copyrighted lament for the death of my dog is not because I do not feel keenly her loss.

In the meanwhile Patsie having been heard of in Arkansas and Iowa at the same time, caused distraction for my sad and over-burdened heart. Scouts armed with toy whistles and wild duck calls were prevailed upon to scour the earth. For three days the search was kept up. No Patsie. I then took a two-days' whack at it myself in a wagon, varying the means of transit in an old locomotive on the "narrer-gouge" railway. No Patsie. On the evening of the sixth day, a man leading a something which appeared to me to be a short section of a red clay drain pipe, appeared upon the scene. He demanded twenty-five cents for the animated hollowness. I looked through the pipe several times, spotted an undigested liver pill and knew it was Patsie. The long lost Patsie of Patsieville. Behind the dog appeared the band who had been discoursing sweet music on the bird-like whistles and duck quackers. The wandering minstrels had come to cuss their luck as they saw the promised reward hovering out of reach. After serenading me and demanding shekels, they left. Then Mrs. Clamhoister came for $1.30 for a breast of veal knocked off of her calf on the "narrer-gouge" railroad, while I had been skirmishing in two counties after Patsie. This finished the outlay, for I secreted myself on a muskrat house out on the marsh, where neither man, woman or child could wade to me except in gum boots, which don't grow on trees out West.

As for the shooting, my brother-in-law had been having fine sport. On returning home one evening from the marsh he came on some wild turkeys on the roost. He killed three big fellows; one we eat and the others were sent as presents to friends. But after my brother-in-law left for home I had to pay $3 for the turkeys, which turned out to be tame ones belonging to old man Gobblingrod's flock.

But seriously speaking, quail were in thousands, and during the cold snap (for we could walk on the ice toward the end of our stay) mallards were in millions. I fairly slaughtered them in the oak timber. Then came a dreadful

storm. It rained three days and nights, and "the river" (Juniata river size) rose eleven feet in one night. The bottom lands were all submerged, and on the spots left out of the flood, thousands of rabbits and quail huddled together for safety. The trees which seemed sinking out of sight were alive with quail. There they perched until hunger made them too weak to hold on, and they fell dead into the water beneath. On one island of two acres I saw over one hundred rabbits. The roads became impassable. A section of five miles of the "narrow-gauge" was washed away. Millions of bushels of corn were lost. The cornfields were alive with ducks for two days until warmer weather drove them north. The loss of crops to the "bottom" farmers was immense. They tried husking corn into dug-outs. I saw one old fellow attempt to cross a creek, where the water was sixteen feet deep, in a dug-out canoe. It was only one inch out of water. He sat on a heap of rescued corn paddling. I said, "Say, old pard, if the river rises much more before you land you are gone." He did not answer, for at that moment he quietly sank out of sight. The water had "riz" an inch while I was speaking. I merely mention this to show newspaper reporters how to impress upon the public the quickness with which the rivers can rise in the wild West during periods of overflows. Hundreds of families fled from the flood. Chickens mostly roosted on chimney tops. "Hogs has the cholere," was heard on all sides. The whole country was transformed into a sea and remained so for several weeks. I frequently asked the inhabitants if they had seen anything of Noah, but they said that was not funny when people were being drowned out, so I gave them a rest, as I will also do my readers. CHOPSTICKS.

CAMPS IN THE WILDERNESS.

IT was Sept. 28, and once more I was afloat on the grand old Umbagog Lake, this time in a forty-five-pound canoe capable of carrying a weight of five hundred pounds. A light breeze had rippled the surface of the lake just sufficiently to impart an exhilarating motion to the canoe, and it was with the feeling of grasping the hand of an old friend that the paddle was taken up.

For the first time in my camping-out experience in the wild woods of Maine, I started out alone, and it was not without a feeling of lonesomeness that the first dip of the paddle was made on the trip to the upper waters of the Magalloway.

By noon I had crossed the lake and pushed up the Magalloway to Pulpit Rock. The ministrations of the passing seasons make slight impressions on the old pulpit, and the rock and surroundings had a rugged, homelike welcome to the lone paddler. The previous year a companion had been present to break a fast at this spot, which had been the scene of many a noonday lunch on our annual trips to the Magalloway. At 5 in the afternoon the canoe was drawn ashore at the mouth of the Diamond, and a cheery greeting was received from Uncle Peter Bennett and his family. If one has ever paddled some thirty odd miles against wind and current he can appreciate the feelings with which I welcomed Uncle Peter's generous bounty.

During the evening neighbors dropped in, and many a sly note was taken from the stories related of camping and hunting experiences. Uncle Peter told of how once in his youthful days he was out moose hunting with Jack ——. They had followed the track of the moose for many miles, occasionally coming in sight of the animal and within rifle shot, but they did not propose to pack that moose meat any further than was necessary, but as Uncle Peter expressed it, to "let it do its own packing." The scheme was to follow the moose until he should be somewhere near the river, and there dispatch him. They would sometimes get so near that the moose would turn on them, but if they stopped he would again move on, and at times he was entirely out of sight. Finally the word was given and his "pard" fired. The moose turned. Uncle Peter had his eye on him, and "where he could put in where he wanted to, unhitched and brought him down." But where was Jack? Nowhere in sight. Looking up, however, he was discovered in a tree some twenty-five feet from the ground, hanging on for dear life, his snowshoes dangling in the air. The instant he had fired the rifle was dropped and he had shinned up the nearest tree. Uncle Peter, meantime, had been so intent on the game that he had not noticed the maneuver.

Monday morning, after a couple of hours paddling, the upper settlement hove in sight. Made the canoe fast to an overhanging tree, and then, with wading boots drawn on, set off for Clark's farm, where Walter Buckman, the guide, was expected. After dinner the canoe, camp toggery and provisions were hauled over the carry two and a half miles to the head of Escohos Falls. Here we met a party coming out, and evidently they were slightly out of humor, tired out, no doubt, and perhaps disgusted with their luck. With considerable scolding on the part of one, and a free interchange of doubtful compliments among the others, they made their way to the foot of the falls. Our guide took in the situation and asked, "What will you sell out for?" You may just rest assured that these blankets which resulted from the dicker were decidedly acceptable on succeeding cold nights when the mercury fell below freezing.

"We will have an early breakfast, and if you are not too much of a tenderfoot, can camp at the catnip beds to-morrow night," insinuated the guide. We saw the early dawn of Tuesday. Loading up the canoe and boat (to which Walton had given a liberal coating of pitch) not forgetting to look about to see that nothing was left, the fleet struck. It was a pretty sight, and a surprise to many of the lumbermen as unsuspected we noiselessly glided within paddle's length of them as they were busily engaged on the banks. We stopped at many places along the river, and ate our noonday lunch at Hunter's Camp, so-called, though nothing but the camp ground now remains, the camp having been burned by some careless lumberman. This spot recalled several pleasant nights spent in the camp some four years ago. Two miles above here we met N. C. Natting, M.D., F. G. Perry, of Concord, N. H., and F. E. Shaw, of Brocton, Mass., camping at Lewis's Camp, on Lower Metallic Pond, and we were heartily welcomed and invited to come often. "Just quarter past three by the right time," remarked Walton, glancing at a wheezy old Waterbury relic; and we have struck the catnip beds. Not a bad day's work for single paddles.

Did you ever sleep on a bed of hemlock boughs? Not one of your rough-and-tumble affairs, half saw-logs and stumps, but made in this fashion: Place a six inch log at the head, smooth off the ground and grub up all stubs and sticks. Collect the boughs and break off the tips—be careful not to put in anything else—then commence at the head and place the boughs, tops up and the points or stubs down, the boughs to incline back and resting on the log. After laying one course continue by laying others, always commencing at the ends and working across. You can make a good bed in one hour's time, and the time is well spent. It is the most important feature of a pleasant camp in the woods to have a good bed, and yet how few pay proper attention to the matter. Should the bed become hard after a few nights, place another layer of boughs on top. The beauty of this bed is it keeps you from the ground, is springy, and the hemlock odor is healthful. Always select a spot that inclines downward considerably. A foot log should be placed where the last course of boughs had been placed, the log to rest on the ends or stubs. This will keep the boughs in place at the bottom and also serve as a foot rest. There are many who contemplate a trip to the woods for the first time and who are always glad to learn, and for the benefit of such I have been thus explicit. Such a bed we prepared, and that Tuesday night slept the sleep of one at peace with mankind. That evening plans were laid for future movements, and an early start for upper Metallic in the morning agreed upon.

"Wake up, boss, and get around some of this partridge stew; make you feel like a fighting cock." Thus saith the guide, and we had too some coffee strong enough to stand alone. Getting the shooting irons in readiness and launching the feather-like canoe, we shot out for game. Game must be had, and something worth talking about. Carefully and silently paddling along, we had not long to wait before a deer was seen to take to the water some distance up, and leisurely swim to the opposite shore. Shoot of course we did, and scored a clean miss. This served to drop our spirits to about ten degrees below zero.

An hour's paddling brought us to Upper Metallic. Hiding the canoe, bottom up, in the tall grass, and shouldering the rifles we took the trail leading to Lincoln Pond, some three miles from the river. Walter pushed on ahead, while the rear guard leisurely tramped along, taking several partridges. These, together with pair of ducks shot on Upper Metallic, and roasted over a bed of coals, with tea made in our pint dipper, served with half of an onion as dessert, made up the bill of fare for a lunch at the pond. The guide remarked, "To-night we will have a regular lay out." Thus we spent many pleasant days in tramping through the woods, and canoeing on the river and adjacent ponds. Several trips were made to this little sheet of water during our stay in camp, and the canoe played an important part in making the visits more interesting.

"Perhaps you would like to hear of a little adventure I had several years ago in a forced trip to Lincoln Pond," said the guide as we sat around the camp-fire that evening. "I was about fifteen years old, when, late in November, in company with my pard, I came up river one clear but cold day from gramp's [grandfather's], bound for Parmachenee. We paddled lively and put up at Spoff Flint's camp on Parmachenee carry that night. The weather grew cold, and, finding a young chap some seventeen years old at the camp who wanted to get down to the settlement the next day, we put our heads together and arranged to take him down. Well, the chap was from Massachusetts and he had the notion that he could come up here and get lots of money and have a big time trapping. He had been here about a week and wanted to get home bad. All three of us started late on the following day and came down through the quick water in a hurry, but soon struck ice too thick to break through. It was getting late and we had but one partridge for food. You see, we had expected to reach the settlement that night, but there was no use trying for that. We did not know the direct route back to Spoff's camp by land, but we did know the trail over to Lincoln Pond and from that place to Spoff's camp; besides, there was a camp at the pond where we could at least have a shelter. Leaving the boat, we started, but had not gone far before the city chap showed signs of petering out, and before long he wanted to lie down in his tracks. It was tough, I know, but the cold had increased and I knew that we must get him along somehow; so my pard carried his duds and we cut switches and switched him along. He would lie down, but we would pull him up and cuff him, and even raised our foot sometimes to help him along. Never saw such a darn fool, but then he was such a thundering tenderfoot that he could not help it. We reached Lincoln Pond and found a camp where we roasted the partridge, and tell you what, boss, between us there was hardly a feather left.

"We slept spoon fashion that night with the city chap in the middle and managed to keep him alive. Next morning as soon as it was light, we took the trail to Spoff's camp—where we had started from the day before—distance seven miles. It was a tough pull for the 'young trapper,' but by dint of cuffing and switching, with an occasional internal application of raw whisky, we managed to reach Spoff's, but when we finally struck the camp he fainted clean away. Tell you what, my pard and I wanted something more than a faint—grub we must have. While the rest worked over the young fellow, we got hold of some cold venison and worked it into our system lively. Better warmed up? Perhaps so, but we couldn't wait for that; let it warm up after getting down."

Having finished his story, the guide laid more sticks on the camp-fire, and drawing the blankets over us, we lay down, lulled to sleep by the moan of the fir trees and the rustle of dry leaves in the crisp October breezes, occasionally startled by the snapping of dry twigs as some wild animal made its way to the spring for water.

Early on the morning of Saturday, the 11th of October, 1884, we made an early start, bound for Parmachenee. Found our friends, previously referred to, in camp above Upper Metallic. They were unusually happy, having a good-sized buck hung up in camp, which had been killed the day before. Good shots, too, judging from the two bullet holes just behind the shoulder, not two inches apart. Pushing on the guide made some not very faint remarks about a weak stomach, but we managed to get along until we reached an abandoned camp on the Parmachenee Carry, called Lundy Pond Camp.

On our way up river we met a party consisting of Henry Chase and wife, William Durkey, wife, and their four-year-old son. They had been on a regular camping and sporting trip, the ladies being as fully enthusiastic as the gentlemen. They had been very successful, the spoils of the hunt, together with equipments, making a heavy load to work over the shoal places so frequent on the Upper Magalloway.

Ten minutes after the guide got into camp he had a roaring fire in the mongrel stove, and had bread mixed ready to put into the oven. In less than an hour he had prepared and set on the table the following spread: Fried partridge, hot bread, fried potatoes, and tea, together with canned cherries and milk, a feast fit for a king. An hour's sitting wore away the keener edge of our appetite, and while the guide busied himself in singing and imitating the cry of almost every animal we have any knowledge of, the scribe got out the field glass, and after taking in the situation, settled down to his notes and memoranda, until gathering darkness reminded us of the necessity of illumination. We had neglected to bring candles or lamps from our home camp, but the guide manufactured one out of pork fat and rags.

The pattering of the rain on the thin roof above us disturbed our Sunday morning nap, and investigation showed that the prospects were for more. We decided to take a stroll to Parmachenee, and if our provisions held out to stop another night at the camp before going down river. A good shelter from the rain with a cooking stove thrown in is not to be despised when in the wild woods. Thus far the supply of small game had been abundant, and we hoped for more. With rifle and shotgun in hand, a three-mile tramp in the cold rain brought us to the foot of Parmachenee Lake. Here, in a lumberman's hut, a fire was soon kindled, lighting up the dripping logs of which the hut was made and gleaming on the faces of two rather damp stragglers bent over the blaze busily engaged in preparing a meal that, as the guide expressed it, would make us as hairy as Esau, adding that such food was the stuff to make men of. Salt pork, fried potatoes, and last but not least, four good thick slices of venison steak, done to fit the weak stomach and accompanied with Sampson tea. We returned to Lunday Pond Camp for the night.

On the following morning with a clear sky, but somewhat colder air, all hands were ordered out, packs were arranged, and in a short time we were on the wing for our home camp at the Catnip Beds, some ten miles below. "There's a right smart chance for more wet," remarked the guide, "and we would best hump along and try for camp before that cloud lets out on us." But it was of no use, down came the rain in bucketfuls, the wind blowing strong enough to drive us up river against a strong current. In the midst of it a couple of ducks came within gunshot, and the guide pulled the gun from under the covering and brought down one, dropping it within ten feet of the boat. "Good shot, considering," he remarked, as he picked up the duck, "sort of fill up the chinks at dinner time." The tempest was short but severe, toppling over many old monarchs of the forest, and the crashing and grinding of these, mingled with the sharp lightning and heavy thunder was terrific and grand. Here among the rugged hills and mountains the thunder had free play, and the heavy peals seemed to gather fury and force as they echoed from crag to peak, and broke out above our heads. Stopping at our friends' camp we found them busily engaged repairing the damage done by the storm. Their boat had floated away in the night and the Doc took passage with us to hunt it up. Found our camp in good order. "All dry," remarked the guide, as he stepped inside the tent, "guess that slumgullion does the business." The tent had a coat of parafine and then a warm iron applied to drive it into the cloth.

The following morning we broke camp. It was rather a cold, dull day, and snow squalls were frequent. Stopping at Clark's farm, on Escobos Carry, for the night, and taking in two square feasts, we were in fighting trim for a long paddle next day. Leaving the upper settlement during the forenoon, and dining with Uncle Peter Bennett at the mouth of the Diamond, where we cast off our camp clothing, and reaching Ewel Dam that night, completed the day's doings.

The canoe used on this trip was built to order by Messrs. Joyner & Sons, Glens Falls, N. Y. The dimensions are: Length, 14ft.; beam, 34in.; depth at center, 11in.; depth at bow and stern, 21in.; and, as before mentioned, weight, 45lbs., and is capable of carrying a burden of 500lbs. It is built smooth, not lapstreak, which to our mind is much the best; no paint, but finished in oil and varnish. The joints are peculiar to this make, and lap some seven eighths of an inch. Although the boat was transported from Glens Falls to Umbogog, some three hundred miles, in July, and not put into the water till October, not a single leak was discovered; in fact the canoe proved perfectly satisfactory in every particular. KONOG.

A MAGAZINE RIFLE ACCIDENT.

Editor Forest and Stream:

Some two weeks since I was hunting squirrels at Clyde, N. Y. and met with an accident which happily was confined to the loss of one finger and a few days' inflammation of the eyes. As near as can be stated the particulars are these:

I was using my favorite rifle—Winchester .38-caliber—with which I have fired over 17,000 shots, and a cartridge exploded while being pressed in the chamber. An assistant had reloaded my cartridges and this one had its bullet pressed so far in the cartridge that its length was shortened by a quarter of an inch. This cartridge was placed in the magazine and when I attempted to elevate it into the chamber the bullet (what was exposed to view) passed in the chamber, but the end of the shell caught on the upper side of the chamber and would not enter. At this instant I was watching a squirrel in the top of a tall tree and my eyes were therefore turned upward and at arm's length from the gun. The lever not going back the middle finger of the left hand was utilized to push the end of the cartridge down and pulling gently at the time with the right hand on the lever upward. This is all I can remember of Oct. 1. The cartridge exploded on its upper side, tearing off the middle finger at the third joint and badly lacerating the adjoining ones. My eyes, although turned upward, as stated, were literally filled with powder, many grains firmly imbedding themselves in the corners. My eyesight, which was feared to be lost or permanently injured at the time, is unimpaired, and at this writing my eyes are apparently well.

Upon examination of the cartridge it was found to have entered the chamber three-quarters of its length, with a large hole on its upper side corresponding to that portion which was out of the chamber. It was split in two the entire length of the cartridge. The primer had been properly pushed down, and the hammer had made the usual indenture found in them after firing. How the hammer became unlocked before the lever was fully up against the stock, or if it were locked at all, I cannot say. It did not injure the gun, and the action of the hammer and lever is as perfect as any of its kind. Other cartridges were in the magazine at the time and did not explode them, as was reported by several Western New York papers.

I send these facts to warn your readers, or caution them perhaps, against using cartridges not properly reloaded; and it is my judgment any cartridge is entitled to a certain amount of respect, and should be handled accordingly. If any of your readers know of similar explosions or any premature explosion of a cartridge I should like to know the particulars, to be able to avoid such an accident if possible.

Perhaps any of us can learn a valuable lesson from such an unpleasant experience.

I shall read with great interest all communications on the trajectory test, as I have been deeply interested in that matter for years; in fact, have made thousands of experimental shots with the Winchester rifles of all caliber, loaded with various grades of powder, but have not been able to devise a plan which would remove the curved tendency. In my experiments, covering the past three years, I have used a telescope sight attached to the side of the barrel after my own fashion, and I find that in the .32-caliber Winchester, loaded with FFFG Hazard powder, it gives a very satisfactory flat line of fire under 150 yards. The telescope lessens the apparent raise of the bullet materially, owing, I believe, to the certainty of aiming exactly at the bullseye and not above it, as is the case when the distance or light makes it difficult to exactly define the target. Then again, resting the muzzle of the gun instead at the point of equipoise, in my opinion causes one to shoot high. This tendency is apparently increased in light guns having much recoil.

E. C. WALDURFF.

BUFFALO, Oct. 8, 1885.

QUAIL—BOB WHITE—PARTRIDGE.

Editor Forest and Stream:

I am glad "Coahoma" stands up for the correct name of the *Perdix virginianus*, to wit, partridge. To be sure, our Northern friends have no idea of ever giving up their name of quail for the same bird; but that is no reason Southern gentlemen or huntsmen should blindly adopt a misnomer. Audubon describes four varieties of partridge in "Birds of America," but never a quail, and expressly says that at the North the Virginia partridge is improperly called quail. The accomplished Lewis, author of "The American Sportsman," makes plain the difference between the two birds, and Stonehenge, a high authority in England, tells that the quail breeds in Africa, and flies across the Mediterranean into Europe, where it is shot in immense numbers. Indeed, these two species are not so nearly allied as the Carolina turtle dove and the passenger pigeon; for the flesh of the quail is dark, fat and greasy, while that of the partridge is white and dry. Moreover, their habits are entirely dissimilar.

I think, too, it is a pity we have let our Northern neighbors change the name of our old hare to rabbit, since the rabbit is not indigenous to this continent, and the two animals are as distinct as the sheep and the goat. BIRDO.

SLASHES, Va.

THE ADIRONDACK DEER.

Editor Forest and Stream:

While I would not ignore in the least the many advocates of the deer hounding law, some of whom I know labored persistently to the last moment for its success, much credit is due the FOREST AND STREAM for its wide extended influence all over the country, when it took the side of humanity as opposed to slaughter and butchery of the innocent deer driven into the water in which there was no escape. It has happily moulded a healthy sentiment in opposition to this cruel mode of hunting.

Call me a sentimentalist, a humanitarian, call me what you please, but I could never bring myself to look on with indifference and see the timid deer chased by the swift, persistent hound until half dead with fright, melted with heat, and with protruding tongue and panting sides he plunges into the water. Here instinct has taught him that he can baffle the enemy on his track; when well out in the water he should be safe; when, lo, a boat pushes out from the shore and cuts off his retreat; he plunges frantically this way and that to escape his now more deadly enemy. His pitiful bleating for mercy is of no avail, there is no possible chance of life and he is ruthlessly murdered by the pot-hunter, or so-called "sportsman."

Age with its attendant decrepitude and failing sight can no longer compete successfully with the sharp senses of the wary deer. But I like to hunt as well as ever, and if I am fortunate enough to kill a deer it will be fairly, and not by trapping him, or what is equivalent, by driving him into the water, where I can have all the advantage.

After the bill had been passed I found there was still much to do to insure the enforcement of the law. I consulted with sportsmen and guides interested in the preservation of game in this section and found that they were willing to contribute something toward having a good man to attend to the enforcement of the law. I started the subscription with $50, but it will cost me three times that, as I am bound to pay all that others do not contribute, which will not be one-half of the expense. But I do not care for that. I mean to have one year of quiet if its does cost me $200. I accordingly engaged a man deputized by the State game constable, and he began his labors the first of July. He has proved to be the right man in the right place. He is all over and turns up where he is least expected. Silence reigns supreme. The deer grazes undisturbed on the mountain side and in his native haunts, and I imagine that his heart yearns with gratitude to FOREST AND STREAM and other coworkers for the Curtis hounding bill, for the quiet, undisturbed rest he is permitted to enjoy.

I am informed that hounding is practiced on the Fulton Chain of lakes and on the east side of the woods, which is only winked at by the game constables of that section, and if so, these negligent officers should be removed and others that will do their duty put in their places. But there has not been heard the voice of a hound in pursuit of deer in all the Beaver River country, patrolled by our private game constable.

There would be no trouble whatever in enforcing the game law in respect to hounding if the game constables were disposed to do so; but I think the constable in charge of the Fulton Chain of lakes was much opposed to the hounding bill, hence his lack of energy in this respect. Deer are, of course, scarce from the great slaughter of the past two years. There is great rejoicing here that this slaughter cannot be repeated this fall. While the law is on my side I shall see that no hounding is done in this section. Last fall more deer were killed in one day by the hounders within three miles of my house than I have killed in the past two years. But, thanks be to FOREST AND STREAM and all workers for the deer hounding law, this thing cannot occur again.

In my post office I have posted the deer hounding law published by FOREST AND STREAM and directly under it is a large rooster, cut from pasteboard, in the act of crowing, whose clarion voice proclaims to both friend and foe the great victory we have achieved in the salvation of the deer by the completion of the Curtis hounding law. I rejoice that this fall I shall not be compelled to send in to FOREST AND STREAM the bloody record of the wholesale slaughter of deer by hounding.

Inclosed is $4, for which please send me FOREST AND STREAM for one year. I like it for what it has done. It has taken the side of humanity, decency and game protection. Let the deer slaughterer heap maledictions upon it if they will, they cannot harm it. It is above reproach. It has the honor of advocating and aiding in the completion of the best law that could be devised for the protection of the deer in our Adirondack forest. CHAS. FENTON.

NUMBER FOUR, Adirondacks, Sept. 28.

AN UNSUCCESSFUL DAY.

MY TENT is, for the present, pitched at the mouth of the Jemseg—the outlet of Grand Lake—a place made memorable in the history of Acadia as the site of one of La Tour's forts, and the scene of some of the bitter fights between him and his rival Charnissé. Though all recent writers on the subject mention the fact that La Tour possessed a fort at this place, yet some of them place the scene of the fighting near the present city of St. John. Cannon balls and musket bullets have been found in the washouts on the adjacent intervale banks in sufficient quantities to indicate pretty sharp fighting, and as he was always at peace with the Micmacs, the only inference that I can draw is that it must have been done with his rival. The fort was situated on a knoll commanding both the St. Lawrence and the entrance to Grand Lake. Portions of the glacis are still visible, but the site is now a cultivated field. The boom of the Frenchman's cannon has given place to the sharp roar of the 10-bore, for the marshes adjacent to this place cannot be excelled by any inland place in this province as a resort for wildfowl, but it was much better ten years ago than it is now.

The grouse law was off Sept. 20. I cleaned up my old gun, or parody on a gun, and loaded a baker's dozen of shells, thinking perhaps I would be content to come home by the time I had fired them all away, and prepared to spend the day in the woods of Clifton. True, I had no dog, but had I not often in my boyhood days made good bags without the aid of a canine, and was I less smart now than then? In my snowshoe tramps last winter I had located every grouse within a radius of two or three miles; and I never saw more grouse or a finer lot winter safely than tided over last season's cold weather.

In this country the ruffed grouse individually haunt a particular territory, usually about one-fourth of a square mile, but the real shape of their beat depends a good deal on the formation of the ground and the abundance of food. I have noticed no difference in the extent of their range, whether there were two, three, or a whole flock using the same piece of ground. I have seen the same grouse every day for three months. I don't believe they ever migrate, except when compelled by scarcity of food, or some other cause they cannot control. I have noticed also that they have their favorite places in their beats, without being able to see any reason for their partiality. Some turn in an old road, perhaps, or a little glade or flat. I can point to one single spot where I have killed probably a dozen grouse, but never saw more than one at a time; neither did I ever kill two during the same season. The hunter's success depends to some extent on his knowledge of these places. I do not believe there are more than two men living who can discount me in finding birds on the grounds adjacent to the place where I was brought up.

On this day I beat the woods thoroughly between the Kennebeccasis and Puddington's Lake without seeing anything but one hermit thrush and an occasional red squirrel. I approached the lake cautiously, hoping to find some ducks; but there were none there. While I was doing this fine piece of creeping I passed within thirty feet of a pine limb which was lying on the ground. On it was a projection which very much resembled a squirrel. Passing the same place again twenty minutes after I was so much struck with the likeness that I shied a stick toward the limb and the excrescence disappeared like a flash. I present this as evidence that things are occasionally "what they seem."

I struck through a splendid growth of sugar maple toward Walton's Lake. On the whole, I rather like mountain lakes, but I hate the oozy swamps that often environ them. While picking my way along the edge of one of these, an old cock grouse which I recognized as a former acquaintance rose and dashed into a thicket like a bullet. I hunted for the old thunderbolt about half an hour, and then instead of "riddling" him, as I intended, I "gave him up," as I often have riddles. Going on about a mile I came to an old lumber road, when up went another grouse not ten rods from where I had often seen one last winter. He offered me a good, fair, flying shot, and I wouldn't take it; but having seen where he settled, I deliberately followed him up with the fiendish intention of potting him. However, I didn't pot him to any appreciable extent, for he ran about thirty yards at right angles to his line of flight, and rose, twisting around a dead tree top as he went, and I almost thought I could see him wink his left eye at me as he disappeared. I think I hear some one say, "Served you right," and I bow my head to the justice of the verdict. But I beg to present to the reader a few extenuating circumstances. I have spent weeks in the woods of Clifton and vicinity, and only three times did I succeed in shooting anything. If the good people of the village knew the Indian name for "The-Man-Who-Goes-to-the-Woods-with-a-Gun-and-Gets-Nothing," I would doubtless get the benefit of it; but the English form is rather long for common use. Is it any wonder, then, that in order to remove the stain on my character I would endeavor to get in a sure thing on that cunning old grouse?

Failing to find the bird again I struck through the woods to McGinn's clearing, a fair specimen of a backland farm. As I crossed it I couldn't help wondering how much money it would take to induce me to live there. An old man, with one foot in the grave, and the other so near that it displaced the loose earth on the edge, came out of the house and began to cut wood. As I watched the feeble blows of his axe I fell to moralizing on the bright and dark sides of the picture presented by a long life. Soon I came to a beech ridge where I had frequently flushed six grouse last winter, and from which I expected great things now that they had had a chance to increase and multiply. My best work could only start one grouse, and he rising very wild took a bee line in the direction of Anticosti. I took another route to Walton's Lake. On my way I called at Camp Campbell, or "Hotel Backlands," as we used to call it; a deserted lumber camp, which only last winter was the scene of all the bustle incidental to this busiest of lives. As I leaned against a tree I recalled the small neatly dressed figure of the foreman who could take as heavy a "hand-spike lift" as the best, and the stalwart forms of the men who used to labor shoulder to shoulder with him. I thought I could see "Hilly," the cook, with his bright red hair, good-natured, freckled face, and his feet, for he it known there never was so much of any man of like weight lying on the ground, while his canvas pantaloons, as if uncertain of which to be most afraid, the face or the feet, hovered about his knees at a safe distance from either, stayed only by a calf-skin suspender which constituted the "moorings" that prevented them from making their escape. For a complete picture of departed glory give me a deserted lumber camp. Some forest vandal had broken the windows and the door stood ajar; while around grew a few spires of timothy and oats, whose lives in the forest were destined to be about as ephemeral as had been the stay of those of the persons who were the means of sowing them. The lumberman has been thoroughly condemned by contributors to sportsman's papers. I know him as few men do. I've been one with him. I consider him an industrial necessity and there I leave him, with the additional remark that he is fast disappearing from this province.

Resuming my journey I crossed another aggravating piece of swamp. As I stood on a hummock I saw a red squirrel preparing to jump from a limb of an ash, and when he was in mid air I threw up the gun and fired. A dull thud told that my aim had been true, but had he been anything worth shooting I would not have touched him. Stepping carelessly backward one foot sank in the soft ooze of the swamp, perhaps a just retribution for killing the squirrel, but it was a fair flying shot. The rest of the hunt degenerated into a tramp, and I reached home feeling as if I didn't want to see the woods again for a month; but actually I would have been glad of the chance in two days.

The result of my hunt was a bad cold. The most noticeable feature in the hunt was that I saw no young birds, but the same old bachelor and old maid grouse that were there last winter. In my year's stay at Clifton I acquired a knowledge of its grand old woods and little lakes that is not equaled by that of some that were to the manor born; and I shall look back on some of the days I spent there with a good deal of pleasure. My exploits with the gun were few and insignificant, but some of my feats with the rod gained me a local reputation if nothing more. The hills were generous to me, for I enjoyed such health there as I have not known for two years. Farewell land of rugged hills, delicious small fruits, delightful autumn scenery, semi-perennial fog and genial people. *Vale!* L. I. FLOWER.

JEMSEG, N. B.

MOOSE HUNTING IN NEW BRUNSWICK.

ON the twenty-fifth of February last, after driving sixty miles from Derby station of the Intercolonial Railway to the headwaters of the Savogle branch of the Miramichi River, a friend and I left McPowers's lumber camp in the gray of the morning, he carrying a double-barreled gun charged with bullet and buckshot and I a .44 caliber repeating rifle. We had three hunting days before us; the snow was five feet deep and a slight crust made fairly good snoeshowing. After traveling about three miles in one direction by pocket compass we struck a caribou track. Our hearts beat high as we turned to follow. In about two hours we saw two small caribou standing in the edge of the thick wood across an open distant about 150 yards; but there was very little chance for a shot among all those trees. At this moment a fine large fellow jumped up from the snow, where he had been resting, ran a few steps and stopped behind a clump of trees which allowed only about a foot square of his belly to be seen. My never-failing rifle placed the bullet in this spot and he fell like a stone. Believing him dead I turned to look for the others, when a shout from my companion told me that the caribou was up again and away. As the snow was plentifully sprinkled with blood we felt sure of overtaking him; but in this we were mistaken. They did not sink more than a foot in the snow and could run two miles to our one. They would lie down and rest about every mile and start again on scenting us. Late in the afternoon we ran across a moose yard, but kept on after the caribou until it was time to steer for the lumber camp, which we reached at dark thoroughly disgusted with caribou hunting. A good square supper with the lumbermen and a glorious sleep fitted us out for the next day, which was destined to see a yet more exciting chase.

We went straight to the moose yard, and after circling around for a considerable time, found his track leaving the yard. Straining every nerve, we gave hot chase for about three miles. As we were nearing a large tract of second growth, and on rising ground, a "There he is" from my companion woke me up to the fact that he was not far off. We could see the bushes swaying to and fro about 250 yards ahead. We both started to run for a little knoll 50 yards ahead to get a good shot. In the excitement his snowshoe caught in a twig and he fell into the deep snow, so that I reached the knoll first. When I got on top the moose was about 200 yards away, making lively for other parts. I fired for his left shoulder and over he went. By the time he got up I fired again and over he went again. I then ran along to get another shot at shorter range. When I got about 100 yards from him he started off again, so I stopped long enough to fire two more shots, the first of whtch I missed, but the last one stopped him. The shell caught in the rifle coming out, on account of some snow getting in, but he stood perfectly still until I got within 20 feet of him, when he made for me full drive, and it was then my turn to leave for other parts, which I did on the double-quick. I succeeded, however, in getting out the shell, and turning gave him a finishing touch behind the ear, which dropped him stone dead. All this happened in much less time than I have taken to tell it, and the shooting was all over by the time my companion had extricated himself from the scrape into which he had got when we first started to run. In an instant more my hunting knife had done its work, and we very complacently sat down and took a smoke, after which we removed the skin and buried the carcass in the snow to cleanse it from the blood.

It was with light hearts that we turned to walk to camp, bringing with us enough of the moose to prove that we had really killed him. The next morning we pressed a lumberman into the service, made a toboggan, and in two trips had the whole at the camp.

On the morning of the 28th we left the hunting ground, and the camp cook succeeded in running down the wounded caribou the same day. I am promised the skin and head for my share of the prize.

When any of your readers want good moose hunting send them to New Brunswick, where they can take the Intercolonial Railway and stop at any one of a dozen stations, from which a few hours' drive will land them on good hunting ground. When the snow is deep, about last of February, is the best time for hunting moose. In the first of the win-

ter, immediately after the first snow, 5th to middle of November, is the best time for caribou hunting.

I know of one person who shot ten caribou in one day this winter only four miles from Newcastle station, and three more on his way home the next day. After I left the Savogle River with my moose, an Indian shot six more near the same place. H. J. M.

NEWCASTLE, New Brunswick.

[As the law forbids moose hunting in New Brunswick after Feb. 1, the reader is warned not to take the advice of "H. J. M." as to season, unless desirous of making himself liable to punishment as "H. J. M." was for infringing the game law.]

COLORADO GAME.

Editor Forest and Stream:

The first flight of wild geese south was observed here on about Sept. 29. Only two or three flocks have been reported to the writer. Ducks are plentiful in all our waters, and have been for a month or more. Sportsmen bring in good bags, but no large slaughter of them is reported. Our first frost came yesterday morning, but it was not severe.

An occasional buffalo or a small herd is yet found in the State. Several have been killed and more seen on the plains in the eastern part of the State during the past summer. One cattle herder near Kit Carson killed two. The other day a herder not far from Trinidad killed a cow and captured a calf. He picketed the latter out over night and in the morning found it choked to death. Buffalo have been reported within the last few months on the snowy range between Middle and North Parks; on the Gore range, further to the westward, and about the headwaters of Roaring Fork of Grand River and headwaters of the Gunnison; in no case more than a very few animals. Hunters are killing a few elk and deer, but the great abundance of game that formerly prevailed is gone forever. W. N. B.

DENVER, Col., Oct. 7.

PHILADELPHIA NOTES.

RAIL shooting has been better for the past week than during the whole season, the easterly winds and storms bringing much water into the river. Although many birds had left for the South, those that remained were easily gotten at and in capital order. The storm likewise has made duck shooting good, comparatively speaking; the fowl that have lately come are young and can be paddled on readily. Teal and gray ducks still continue to reach our waters, the seeds of the reed affording them excellent food. Some snipe are now killed, but the rank growth of vegetation which covers the meadows at this time does not make attractive feeding grounds, and the birds in the main still use the flats at low water and are hard to reach. Many rail are being killed along the reed-fringed ditches with spaniels to start them on the wing. We hear of plenty of quail, but learn again the birds are yet small. Oct. 15 is too early to begin shooting them here, and Nov. 1 is considered a better date by sportsmen who are posted.

A flock of Canada geese was seen going over the city "high up" a few days since. No brant have yet reached Barnegat or Tuckerton bays, but ducks are reported as beginning to arrive. These are the marsh varieties, such as black ducks, mud hens, mallards and teal. In a week or ten days the bluebills, redheads and whistlers will be on the grounds and shooting will commence. Sportsmen who desire good shooting on the New Jersey bays should go early, before the ducks become wild. HOMO.

PHILADELPHIA, Oct. 11.

DAKOTA LARGE GAME.

Editor Forest and Stream:

This season I have had but scant time for hunting, and have done none except immediately around my ranch. However, I have bagged so far an antelope, nine deer (three whitetail and six blacktail) and an elk, the latter a fine bull but with a small head, and probably the last of his kind in this immediate neighborhood.

Since writing to you last a bear killed a man about thirty miles down stream from my ranch. This was at the time of the floods last spring. The man, with a companion, were coming down the river on a raft, and stopped at my ranch for dinner, a few days afterward we heard from the survivor that they had landed to hunt a bear, and that one of them followed into a thicket and was killed. A party of ranchmen went out and buried the body; one of them told me that the head had been crushed in, apparently by a blow from the beast's paw, and that one of the arms was bitten through in three places.

This fall I found the body of a black-footed ferret (*Putorius nigripes*) near the house. I am inclined to think that this was the animal whose tracks we used to see early last winter in the light snow around the prairie dog town. As I believe the animal is still considered rather a rare species I thought this record of its existence might be of interest to some of your more scientific readers.

By the way, your correspondent, Mr. H. P. Ufford, of Casselton, Dakota, is, as we count distance in the West, quite a near neighbor of mine. If a good wind ever blows him toward Medora, I can promise him the certainty of a hearty welcome, and the possibility of some sport with deer and antelope. THEODORE ROOSEVELT.

CHIMNEY BUTTE RANCHE, Medora, Dakota, Sept. 18.

AN ODD EXPERIENCE WITH A GROUSE.—Up here in northeastern Connecticut birds are plenty enough to tickle the noses of our dogs, but very few remain in sight long enough for us to get the "circumference" as Lit, our "gillie," says. One day last week, though, we had very good luck. The first partridge brought to bag flew in through the open window of our gun room; then we got the "circumference" of a fine woodcock, and the third bird, a partridge—well, this is the way it happened. Flash and Bang struck a scent near a bunch of pines, worked their way carefully along, stiffening now and then, for about fifty yards, leading us into a place where it was impossible to shoot, so thick and dark was it. Suddenly, with a great whir-r-r, up got the bird within thirty feet of us, but completely hidden from view. It whir-r-rd and whir-r-rd, but, strange to say, the sound did not grow fainter, but finally ended up with a flip-flop, and all was still. We drew near, and behold, the partridge was high and dry, caught by a snare through which it had attempted to run while the dogs were trailing it up. Lit looked sort of foolish and proposed going home—the birds were too thick for enjoyment. We managed, however, to get two more partridges and three woodcock—by shooting them—before we reached home.—F. L. N.

THE FOX AS A TREE CLIMBER.—In your last issue, Oct. 1, "J. G. R." tells of "a red fox in an apple tree in my orchard, eating frozen apples. The tree was a little slanting, but he was pretty well up in the top." If a person is not perfectly familiar with foxes, gray and red, it is not infrequently the case that an old gray is taken for a red, and it may have been a gray in the leaning apple tree; hunger may have "pressed him hard." I have no means at hand of determining the habits of the red fox of Maine, but if he does climb trees he differs in this respect very much from his red brother of Virginia, so far as the matter has fallen under my observation. In the same number a Lockport correspondent notes that one of Washington's letters records the treeing of a fox. Any fox hunter in Maryland or Virginia would be willing to make oath that the fox which Gen. Washington put into a tree twice in two hours was a gray, or that every hole in Fairfax county was stopped. When the hounds "catch," the hunter is said to "have killed his fox." When a red fox is driven to earth it is dug out if it can be done, and the dogs held by the hunters, and the fox turned loose and given twenty minutes the start of the dogs. If a gray fox takes a tree he is shaken out, and if he is not at once killed by the dogs when he reaches the ground he gives us a rattling chase, though generally a short one. Should a gray fox, however, fall into the hands of the hunter unhurt, he is turned loose and given an hour the start of the dogs. Should a man shoot a fox, he would, in Virginia, be looked upon by his neighbors as a brute. People do not eat foxes. I am aware that in some parts of the United States, possibly in some parts of New York, the conformation of the country is such as not to allow of the fox being hunted in the usual way, and some of the best and most honorable authorities have written that "under such circumstances it is not, by some, held unsportsmanlike to drive the fox to the gun with dogs." At the same time they state distinctly "they could take no pleasure in such sport." There are many Virginians who would like to have the opinion of your able, occasional contributor, Dr. M. G. Ellzey, as to whether the fox driven to a tree twice in two hours by Gen. Washington was a gray or red. Dr. Ellzey was born and bred among gentlemen who were ever the first of fox hunters, and was taught, as all Virginia and Maryland gentlemen were and are, Gen. Washington in his day included, "to ride, and shoot and speak the truth." Albeit Virginians and Marylanders were never taught to shoot foxes, it was needless for Gen. Washington to have stated that his fox (a gray I have no doubt) fell from the tree dead, other than as a singular incident which doubtless led to an entry in his diary. No one can be made to believe he, or any other Virginia gentleman, shot, or shoot, foxes. Why Mr. Moncure Conway, who I am positively sure has not fired a gun in forty years, and never at a fox, should have been given a place in Mr. Davison's note I fail to discover. I am satisfied Mr. Moncure Conway does not know a gray fox from a red, and would have to go to his books to tell either from a raccoon.—RICHARD MONCURE CONWAY.

BEVY OR COVEY?—*Editor Forest and Stream:* I am glad to see that your correspondents "Wells" and "Coahama" are standing up so bravely on the game bird nomenclature. The bird which they are talking about is rightly called neither "quail" nor "partridge," but they are very correct in their notion that it is a silly and a purposeless change to adopt the name "quail" in the South. There is another point which I beg to bring to the attention of your readers—that is, the indiscriminate, careless and incorrect use made of the two words "bevy" and "covey." Years ago, when I was taking my first lessons in shooting—and, indeed, my earliest lessons in this branch of a liberal education were cotemporaneous with the earliest events of my memory, for I just naturally imbibed shooting lore from a father, uncles and grandfather, who were all sportsmen of the old school—in those days, I say, no man who professed to be anything of a sportsman ever spoke of a "covey of quail" any more than of a "bevy of partridges." If any one made such a blunder as that he was very deservedly set down for an ignoramus, one outside the pale of true sportsmanship—and we had true sportsmanship in those days. I do not think the craft has improved in these later times, and some of these days I will give you my view on some things, providing, of course, you care for the tattle of an—OLD MAN SET IN HIS WAYS.

MISSISSIPPI.—Aberdeen, Oct. 6.—Our open season for quail began on the first of this month. Weeds are rank and dogs labor under great disadvantages. Several of our local sportsmen were out on the opening day, but did not meet with much success, the best bag reported numbering fifteen. For several days past the weather has been warm and unusually wet. Sunday was quite cool with light frost. To-day the thermometer registers a trifle higher, but fires are quite comfortable. The birds are reported plentiful and well grown. After a few killing frosts, good bags may be expected. We have several fine shots here, but a mongrel lot of dogs.—WILL. Sardis, Miss.—Our quail crop is splendid this season. A large covey came into my yard last week, and I live about the center of the town, and not more than fifty yards from the railroad depot. Squirrels have never been more abundant here than now. Two gentlemen went out one morning last week and killed over 100 before noon. Fishing has been all the summer and is still good.—W. H. C.

WHO TAKES THE DEER?—Sayville, L. I., Oct. 8.—*Editor Forest and Stream:* You will oblige some of the constant readers of your esteemed sporting paper by answering the following question in one of the first numbers coming: Suppose a couple of gentlemen are out hunting for deer, without the assistance of dogs, another party (fourteen in number, as was here the case) were out for the same purpose and their dogs, starting a buck, drove it past one of the first-mentioned gentlemen, who shot and killed the deer. Now the question is, to whom belongs this deer? Is there any law which gives the owners of the dogs a claim or part of a claim to the said deer, or does it belong to the lucky hunter who killed it?—G. F. K. [We believe the custom is for the owner of the hound to take the game, but we are ready to be corrected on this point.]

WORCESTER, Mass., Oct. 9.—At the meeting this week of the Sportsmen's Club, the subject of the annual outing was discussed, and it was finally voted to observe Wednesday, Oct. 21, as the annual field day, and to have the annual supper on Friday, Oct. 23. The sides chosen are to be marshalled by Col. A. J. Titus and A. H. Perry. These two, with Webster Thayer, O. A. Benoit and W. S. Perry, are to be the committee of arrangements.

SPRING DUCK SHOOTING.—The only falling out among the delegates of the National Game Law Convention, at present in session in this city, arose, as was expected, out of the question of spring duck shooting. When thus applied the word duck is meant to include other migratory waterfowl and snipe. The largest bags of the year on almost any kind of feathered game are those made each spring when waterfowl are on the way north from their winter quarters. They have spent the cold season in the marshes of Texas, Louisiana and Florida, where they remain until the mating season has arrived and nature prompts them to proceed north in search of the cool places in which only can they nest. As pairing has almost invariably commenced before they set out on their long flight, the birds will, lover-like, linger in dalliance at every locality which pleases them, and during such periods of rest, varying from a week to a month, gunners get a chance of slaughtering them in thousands. The argument of the advocate for spring shooting is: "I am fond of sport; I get but the shortest kind of a duck season in the fall; the birds are here this spring; what are they here for? If I don't shoot them now I shall have scarcely any shooting at all." The last suggestion was very happily answered in the convention on Tuesday by Col. Barbour, of Louisville, who remarked that if spring shooting be allowed to continue, gentlemen need not bother themselves as to the future proportions of their sport, as duck shooting would soon abolish itself. No man of humane or sportsmanlike instincts can possibly urge that spring shooting should be allowed on account of the amount of practice it offers to a marksman, and every feeling of humanity should be aroused in behalf of the duck at springtime if it is borne in mind that at the time of its northern flight almost every one of these birds is in egg. If spring-shot duck and snipe be examined they will be found not only to be full of maggots in their flesh, but also to contain eggs varying in size from No. 6 shot to the nearly matured ovum, and it must also be remembered that the wild drake is monogamous. Civilization has robbed the duck, as it has many other creatures, of barbaric virtues, but polygamous as is the domestic drake, its wild relative is the husband of but one wife. Shoot, therefore, the wild drake when on its northern way and you leave its mate widowed and sorrowing, and with no possibility of, unaided by her spouse, bringing up the little family she is about to usher into the world so suddenly grown all cold to her. It must be added, if further argument be necessary, that duck going north to nest are altogether unfit for food. Their flesh, what little there is of it, is rank or tasteless; their bodies and feathers are often full of vermin, and their listless, apathetic disregard of danger makes the shooting of them unworthy the name of sport. It was stated in the convention on Tuesday, by a gentleman from Illinois, that in that State he came across a camp of three hunters this spring and found that they had within the short space of a few days shot ten thousand duck, of which the men themselves said, "and not one single one of them really fit to eat." Nothing further than this simple statement should have been necessary to insure the abolition of the detestable practice of spring shooting, one which it is to be hoped will be a thing of the past as soon as the fruits of the convention now sitting are gathered from the different Legislatures. No better work was done by the convention than the frowning down by no dubious vote of so pernicious a practice.—*St. Louis Republican.*

A WATER BUTCHER'S NARROW ESCAPE.—Port Jervis, N. Y., Oct. 9.—Early Wednesday morning Messrs. B. F. Bennet and John C. Westbrook, of Milford, accompanied by Mr. Baldwin, from New York city, went to Log Cabin Pond, in Pike county, for a day's sport. By 10 o'clock they had reached the upper part of the lake, where there is a dense forest which usually abounds with deer. Suddenly Mr. Baldwin noticed what appeared to be a large stump floating in the water. He called his companions' attention to it, and John C. Westbrook said it was a deer, and the party started in pursuit. The deer discovered that it was being followed and started for shore, but before it could reach the land the party overtook it. Mr. Bennet and Mr. Baldwin shot at the animal and wounded it, and as the boat drew near the deer showed fight. The party in the boat become frightened and in the excitement the boat was upset and all found themselves in the water. Messrs. Bennet and Baldwin clung to the boat and finally righted it, but Mr. Westbrook went for the deer and managed to get on its back, and the frightened animal carried him to shore. Just as they reached terra firma Mr. Westbrook drew a large hunting knife and cut the deer's throat and it was soon dead. When the other gentlemen reached the shore they found Mr. Westbrook sitting alongside of his trophy in an exhausted condition. The deer weighed at least 300 pounds, and had a fine set of antlers.

RIDGEWOOD, N. J., Oct. 8.—New Jersey farmers have been so thoroughly annoyed by so-called sportsmen that nearly every town has its game constable, and the "'Squire" or justice of the peace treats every violator of the game laws brought before him with the utmost severity. Rabbit hunting is the greatest nuisance, as everybody seems to consider it legitimate to pull down stone and rail fences in a chase for the coveted cottontail. The open season for this particular game begins on Oct. 31, and the farmers are now busy putting up trespass signs. So thoroughly is this work being carried on that a run by hounds is next to impossible. A non-resident found trespassing with a gun may be apprehended by the land owner (who has the same power as a constable for that purpose), and "shall forfeit $15 and the gun." Natives committing the same offense are liable to a "penalty of $5 to owner, or conviction before a justice, action in trespas."—PRESS.

A DIMINUTIVE GUN.—We saw in the store of Mr. Henry C. Squires, on Broadway, the other day, a little gem of a shotgun, of a gauge corresponding to rifle caliber .36. The barrels were 26 inches, the weight of the arm 4 pounds 10 ounces. There were also rifle barrels, which could be substituted for the shot barrels. In the window, near the little gun, was shown by way of contrast a 22½-pound, 4-bore hammerless gun, with 48-inch barrels, altogether a murderous cannon for duck shooting, albeit a muscular man might hold it to his shoulder and so keep himself within the law.

WEST STERLING, Mass., Oct. 5—The game prospects are quite good in this vicinity. Partridges are quite plenty, also gray squirrels. Several broods of quail were seen in the summer, but none lately.—C.

GRASSBIRDS.—In article "With the Birds at Pine Point," grasbirds should read grassbirds.—H. A. F.

ANOTHER SLEEPING FOX.—West Sterling, Mass., Oct. 5. Some time ago when stories of finding foxes asleep were in order, I sent you an account of a man who was out for a walk and found one asleep, which remained so while the man returned home for his gun, a distance of nearly half a mile, and coming back shot and killed the fox. I wish now to give a still more singular incident which happened recently not over half a mile from the scene of the other. On Sunday morning, Sept. 27, as Mr. James P. Weeks, of this place, was driving his cows to pasture, he saw a fox stretched out under a tree either dead or fast asleep. Mr. W. crawled up and caught the fox by one hind leg, whereupon reynard turned his head and tried to bite, but was soon quieted by a few blows from the butt of a whip. The fox was carried to the house of a neighbor where it was killed.—C.

MASSACHUSETTS GAME FOR NEW YORK.—Birmingham, Conn., Oct. 8.—*Editor Forest and Stream:* Am about to take a three or four weeks' vacation in Massachusetts and expect to shoot a little game during that time. Can you inform me of any reliable dealer in New York to whom I can dispose of it? I believe there is no law in Massachusetts against shipping out of the State.—D. C. PECK. [No, unfortunately, there is no such law; but there ought to be, both for the benefit of the men who leave their legitimate occupations "to shoot a little game" for market, and for the shiftless, lazy fellows who in this nineteenth century can find no honest work to do and so skin the game for New York and Boston market stalls.]

WILMINGTON, N. C., Oct. 6.—It gives me pleasure to report the organization of the New Hanover Gun and Kennel Club at this place. The following officers were elected: Rev. Dr. Prichard, President; W. A. Williams, Vice-President; R. H. Grant, Treasurer; B. G. Empie, H. McL. Green and S. A. Haney, Governing Committee; J. C. Lodor, Secretary. Objects: To protect game and enforce game laws, improve our dogs, and find diversion and improvement at the trap.—J. C. LODOR, Secretary.

DAVE NYE.—In the FOREST AND STREAM the other day I read about "Dave" (Nye) and Chatham, Cape Cod. Have known that "curlyhead" more than forty years, and have been one of his patrons for many years. He went to Currituck and married Mrs. Van Slick some years since; is now near Norfolk, Va., I hear. "Ninety-seven big birds" would be "high line" in the work of weeks for three guns these times instead of one day. Hope India Wharf will "give you more of it."—B.

THE SWAMP ANGEL CAGED.—Little Rock, Ark., Oct. 5.—Teal have made their appearance and the other ducks will soon follow. I think the shooting around here will not be good, as the long drought has dried up many feeding places. I have not heard of any geese being seen. "Coahoma" and his Memphis friends can go to Blackfish now, as the State is entertaining the Swamp Angel on a charge of murder and selling liquor without license.—CASUAL.

FLIGHT OF WILD GEESE.—South Haven, Mich.—I have read the FOREST AND STREAM for years, it renews my youth, keeps me from feeling old. We have to-day seen the first flocks of geese flying south. Weather, rain, sleet, hail and sunshine. By the way, have the "Kingfishers" returned from their camp in Michigan? We would like to have the remainder of their experiences.—MEDICINE MAN.

WILD RICE is advertised in another column by Mr. Wm. Troop, of Hiawatha, which is on Rice Lake, Ontario. This is the time of year to have the rice on hand for sowing a little later. We should be glad to hear from persons who have had success or lack of success with the rice.

WM. DANFORD, of Duane, N. Y., a well-known Meacham Lake guide, was accidentally shot and killed by a New York man whom he was guiding. The hammer of the gun, a .22 cal. rifle, caught on a bush and the bullet was discharged.

MICHIGAN TO DAKOTA.—The hunting car City of Saginaw has gone to Dakota goose shooting. Mr. W. B. Mershon is one of the party. We hope to have a report of the trip.

A WOODCOCK flew across the Creedmoor range the other day during the progress of the FOREST AND STREAM rifle trajectory trials.

CENTRAL LAKE, Mich., Oct. 8.—Wild geese going south. —KELPIE.

Sea and River Fishing.

Address all communications to the Forest and Stream Publishing Co.

THE COMING TOURNAMENT.

THE Harlem Mere, Central Park, can be reached by taking the Third Avenue Elevated Railroad to its station at 106th street, and going west. The Mere is at 110th street and Fifth avenue, opposite the Polo Grounds. Those on the west side of town should take the Ninth Avenue Elevated Road to 116th street, and walk back to 110th street. The tournament will be finished in one day, Wednesday, Oct. 21, rain or shine, unless an unusual storm should occur. A business meeting for election of officers will be held at the close of the last contest in the hotel of Emil Eitel, adjoining the grounds, as the dinner of the Ichthyophagous Club will interfere with the usual evening session. Members of the Association wishing to attend the dinner may notify the secretary on the grounds.

PRIZE LIST.

At a meeting of the committee on Monday, Oct. 12, it was decided to omit the rule which gave winners choice of prizes, and they will be awarded in their regular order. The following is the list:

SINGLE-HANDED FLY-CASTING (AMATEUR).—Judges: Rev. Henry L Ziegenfuss, Fred Mather, Hon. James Geddes, Referee. (Open to amateurs only. See rules in FOREST AND STREAM of Oct. 1.) 1. Association Gold Medal; value, $30. 2. Split bamboo fly-rod, given by T. J. Conroy; $25. 3. Split bamboo fly rod, given by B. F. Nichols; $20. 4. Split bamboo fly-rod, given by Fred Malleson; $25. 5. Levison fly-book, given by William Mills & Son; $6. 6. Six dozen flies, given by W. W. Cone; $6. 7. One thousand "Superlative" cigarettes, given by W. S. Kimball & Co.; $5. 8. Year's subscription to FOREST AND STREAM; $4.

SALMON CASTING.—Open to all. Judges: Col. Locke W. Winchester, Hon. R. B. Roosevelt. James C. McAndrew, Referee. 1. Association gold medal; value, $25. 2. 1,000 "Cloth of Gold" cigarettes, given by W. S. Kimball & Co., $10. 3. Year's subscription to FOREST AND STREAM, $4. 4. "Imperial" waterproof fly-line, given by William Mills & Son, $2.50. 5. Device for drying and storing lines, given by E. J. Martin, $2.50.

HEAVY BASS CASTING.—Open to all. Judges: S. M. Blatchford, James L. Vallotton. Hon. H. P. McGown, Referee. 1. Association gold medal; value, $25. 2. Five boxes "business" fish lines, given by E. J. Martin, $11. 3. Five pounds "Kimball's Salmagundi" smoking mixtures, given by W. S. Kimball & Co., $7.50. 4. Year's subscription to FOREST AND STREAM, $4.

MINNOW-CASTING FOR BLACK BASS.—Open to all. Judges: M. M. Backus, W. C. Harris. D. W. Cross, Referee.—1. Association gold medal; value, $25. 2. "Imperial steel pivot" casting reel, given by William Mills & Son; $14.50. 3. Half gross trout flies, given by James Ramsbottom; $6. 4. Year's subscription to FOREST AND STREAM, $4. 5. Photograph of black bass 11×17 in., given by G. M. Skinner; $3. 6. Device for storing and drying lines, given by E. J. Martin; $2.50.

SINGLE-HANDED FLY-CASTING (EXPERT).—Open to all. Judges: Louis B. Wright, Henry F. Crosby. J. S. Van Cleef, Referee. 1. Association gold medal; value, $30. 2. Half gross Lake flies, given by James Ramsbottom; $15. 3. Package of flies, given by C. F. Orvis; $15. 4. "Dorsal Fin" landing net, complete, given by William Mills & Son; $4.25. 5. Year's subscription to FOREST AND STREAM; $4. 6. Device for drying and storing fish-lines, given by E. J. Martin; $2.50.

ON LONG LAKE.

THOROUGHLY tired out, my natural obtuseness vastly augmented by sleepless nights, my appetite constantly craved a bit of salt pork cooked on a ramrod over glowing coals; a civilized bed became an abomination and I became as irritable as the traditional hen in a brush fence.

Rising one morning from an almost untasted breakfast, I expressed myself as half inclined to give my patients a chance to get well, let business go to the dogs, and camp out for a few days under the old oak on the shore of Long Lake. "Capital! Go by all means! I'll have your mess chest and camp equipage ready within an hour." "Hurrah! I've been aching to propose that very thing!" The first speaker was my wife and the second an old comrade in the "late unpleasantness" and a tried companion in many adventures, ashore and afloat. Standing six feet four inches in his stockings, a giant in strength, the very soul of willingness and good nature, and as keen a sportsman as ever lined the sights or balanced a rod, John filled our quota to perfection.

At the appointed hour Frank and Topsy, staid, serviceable horses, stood at my gate, harnessed to a heavy farm wagon, upon which was loaded a large flat-bottom boat, rods, guns, provisions and what other paraphernalia was deemed absolutely essential to the success and harmony of the trip. Of course Dandy, my favorite retriever, was on hand, and his joyous yelps of satisfaction as we set forth blended harmoniously with our lively chant, "Begone, dull care." Not wishing to be bothered with the care of the horses while at the lake, we had prevailed upon a friend to go along and drive the team back, promising him that within an hour after our arrival at the lake he should have a goodly string of fish to take home. I had even guaranteed that one of the fish should be a five-pound small-mouth bass, delivered within thirty minutes after our boat was in the water.

At 3 o'clock we stood beneath the old oak, near whose knarled trunk my camp-fire had often blazed. Bonny Long Lake, I wish I could find words with which to describe it. Completely surrounded by bold bluffs covered with a virgin forest of deciduous trees, with here and there a sprinkling of evergreens, the lake, its waters clear and sparkling, stretches north and south for more than three miles, with an average width of nearly one-third its length. Its two extremities are marked with a beautiful sandy beach, while the main shores would bring ejaculations of delight from a connoisseur in fishing grounds. My friend agreed to manage the boat for me, if in addition to the bass, I would warrant him a wall-eyed pike of equal weight, the time to be extended to forty minutes. The proposition was readily accepted, and, thoroughly knowing the lake, and consequently knowing just where to cast for any and every kind of fish in its waters, I honestly believed I could meet my obligations, but my hopes went down to zero when I found that owing to the rough road we had traveled the bait bucket was overturned, the last frog gone, and my bass rod smashed beyond hope of repair. Making a virtue of necessity I tossed an eighteen-foot bamboo rod and line into the boat, seized a trolling line and spoon, and we launched forth. Twenty yards from the shore the spoon was cast overboard, and the line unwound until twenty-five feet were paid out. By the time the line was fairly out there came a sharp tug, and a moment later a seven-pound pickerel was beating his death tattoo in the bottom of the boat. "My gracious!" exclaimed Thornely, who was having his first experience in Minnesota fishing, "but that's a young whale." "A young whale! Pshaw! That's only a minnow I've caught for bait. Now pull for that point over to the left, pass it quietly, go about three boat lengths beyond, as many to the east, and then hold steady." Before the point was reached another longsnout, apparently the twin brother of the one we had, was deluded into snapping at the glittering object trailing in our rear, experienced a sudden pain in his jaw and came aboard for surgical assistance, which was promptly rendered. "There! hold steady, Thornely, your five-pound bass is under that bunch of lilypads; just this side of the pads the water suddenly deepens and there is a boiling spring."

Taking the bamboo rod and using for bait a narrow strip cut from the pickerel's belly, I cast as far as I could to the right, allowed the bait to sink several feet, and then drew swiftly toward the spring, but no strike followed. Again the maneuvers were repeated and with a like barren result.

"Isn't there an old proverb to the effect that it is unadvisable to count chickens before the process of incubation is complete," teasingly inquired my companion.

Even as he was speaking I made a cast shoreward, drew the bait to the edge of the precipitous bank and let it go tumbling downward. In a twinkling there was a rush, a strike and a tremendous strain upon my rod. "Great Scott! don't lose him," excitedly cried Thornely, as the fish, a noble bass, vaulted into the air and endeavored to shake the steel from his powerful jaws. Lose him! Of course not, if I could avoid it, but the chances were not overwhelmingly in my favor. Without a reel I could give no extra line, and in his frantic struggles he threatened to demolish my miserable tackle or tear the hook from his mouth. How I longed for my lancewood and reel! A few minutes of persistent battle and the gamy fellow, weighing six ounces more than enough to fill the bill, was lifted into the boat.

"How much time have I left?" "Fourteen minutes." "All right. Move the boat toward that bunch of grass and I'll get the pike." I spoke more confidently than I felt; but there I knew my ground, and somehow the new moon always seems to be over my left shoulder when I go afishing.

Before the fourteen minutes were out I had the pike, and in addition two more bass of 2¼ pounds each. "Please may I ask one question?" meekly inquired Thornely, "I'd like to know if you had made any previous arrangements with those fish."

Lest the great FOREST AND STREAM family may think I am drawing the long bow, I frankly admit, that under the circumstances my success was phenomenal, though if "Wawayanda" will come and manage my boat I believe I can repeat the performance. Long Lake certainly affords the finest fishing I have ever found, and my line has been wet in many waters.

Returning to our friends we found the tent pitched, beds made, fuel gathered, and best of all, a tempting lunch ready. Talk of your great hotel dinners, where appetites are provoked by stimulants, and an after-dinner fill swallowed. Give me the appetite of the honest sportsman, and the wholesome fare of the camp mess chest, and I sigh for no Mohammedan heaven. The day when victims of dyspepsia and consumption, as well as tired brainworkers, give up the pernicious use of drugs, and with rod or gun start for the dear old woods, will be the beginning of their physical redemption.

Our lunch over, Thornely reluctantly turned his face homeward, while we three, happy as schoolboys during vacation, pulled up the lake.

"Hold up, John, and we'll try this spot."

Try it we did, but not a strike rewarded our endeavors. Half a dozen times we changed our position, and still not a fish: but as the sun went down behind the bluffs, a gentle breeze swept over the water, and presto! all was changed. Three rods curved in unison, three lines cut through the water, and three men quivered as though holding the wires of a galvanic battery. "Gaff that fellow for me," exclaimed Jacob, skillfully guiding a huge pickerel round to the stern of the boat where I sat. "Can't do it, I'm engaged." "John, hand me the landing net." "Beg pardon, but I want it myself."

Fast and furious the sport went on. Scarcely would a bait sink beneath the water, before a tug came. Everything estimated to weigh less than three pounds, be it bass, pike or longhead, was unhooked as gently as possible and returned to the water. As twilight came on and "God's little lamps," as my child once called the stars, began to twinkle in the cloudless vault above, we slowly pulled down the lake, fully agreeing with John's sententious exclamation, "It's a blessed good thing to be alive and go a-fishing."

The darkness of a moonless and cloudless night had settled down over the landscape as the keel of our boat grated upon the sandy beach in front of our tent. Five minutes thereafter a roaring camp-fire cast lurid flashes out over the placid waters and caused weird shadows to flit hither and thither among the trees, until one might easily imagine the stalwart Chippewa warriors had returned from the Happy Hunting Ground to revisit one of their favorite earthly camping places. "What shall we have for supper?" inquired Jacob, lifting the lid of the mess chest. The question seemed a perfectly natural and timely one, despite the fact that less than three hours had elapsed since our last meal. O, the appetite one gains in the woods and camp!

"Come, wake up. It's a lovely morning for fishing, and breakfast is almost ready."

Poor John! With praiseworthy ambition he had, single-handed, attempted our morning culinary duties, evidently intending to afford us a surprising exhibition of his dexterity and neatness as a cook. The surprise was certainly complete. On the principle of a big hole for the old cat and a smaller one for the kitten, he had kindled two fires, a little one for the coffee pot and a bigger one for the frying pan. While he was busy with the fry kettle the nose and handle of the coffe pot melted off. While he was splitting a stick with which to rescue the remains of the coffee pot from the flames, the meat and fish in the fry kettle caught fire and were burned beyond recognition. Determined to have at least one palatable dish for breakfast, he placed a strawberry shortcake on an earthen plate over a heap of glowing coals for the purpose of warming it up. The intense heat shivered the plate into fragments, and the cake, after perambulating around in the ashes, went rolling down the hillside and with extreme difficulty was saved from a watery grave. "Gentlemen," exclaimed the imperturbable John, "there is plenty of grub in the mess chest, please walk up and help yourselves."

Jacob was right in saying it was a lovely morning for fishing. Light gray clouds covered the sky and a cool breeze from the northwest made just the right ripple upon the water. Pulling up the lake, we cast anchor in the cove where I had fished against time the previous afternoon; and immediately the sport began. Before I was ready to make a cast and even before John could ship his oars Jacob was having, as he expressed it, "a solemn and lively time" with a goodly sized longsnout, brimful of fight. Now, pickerel fishing on Long Lake is no mean sport; that almost universally despised fish being nearly as gamy as the bass of Eastern waters. I have frequently, when fishing there, had them adopt the characteristic maneuvers of the bass, fight lustily for ten minutes, and during that period vault clear of the water half a dozen times. Hardly was John's line in the water—and our only bait was pieces of pickerel—when a noble bass gave him instant employment.

Not wishing to interfere with my companions, my first cast was outward from the shore and into deep water. In a moment there came a swift tug, a lightning like downward rush, and I knew that my game was at least a four-pound wall eyed pike. Within the next twenty minutes Jacob had secured three pickerel, estimated to weigh three and a half pounds each, John three bass, estimated at three pounds each, and I three pike averaging four pounds each. It seemed singular that each should thus have captured three fish, and should have been confined in his success to one species.

"I guess we have got the last fin here. Suppose we change our location," said John, after some time had passed without any one of us obtaining a strike. "Wait a bit," I answered, at the same time attaching an enormous strip, cut from a pickerel's belly, to the medium-sized bass hook I had been using. "Thunder!" ejaculated Jacob as my bait struck the water with a tremendous thud, "why don't you use a codfish for bait and bob for sharks?" I have already explained, on the way to the lake my favorite rod and reel were ruined, and so I was compelled to use an ordinary bamboo rod without a reel if I wanted to fish at all. Twice I had shipped my abominable bait around the boat, allowing it to sink a few inches beneath the surface of the water, and persuaded by the laughter of my companions was about to withdraw it, when there came a rush that fairly churned the water into foam, and in a twinkling I was leaning over the side of the boat, desperately clutching the butt of my rod, all of which, except possibly two feet, was under water. For a moment it was nip and tuck. With bated breath I held on expecting

every second that the line would part or the little hook snap. What would I not have given for my old tackle with its three hundred feet of silk line.

"Great Scott, what are you hitched to?" gasped John. "Don't know! Up anchor, quick, and do your best to help me with the boat."

As the boat moved I lifted all I dared on the fish and succeeded in guiding him around and around the boat, and as he completed the circle the second time he vaulted into the air, snapping his jaws together with a sound like the springing of a steel trap. "A muscalonge! and a whopper!" shouted John, excitedly waving the gaff about, greatly endangering our heads.

Now the fish makes a rush straight for the boat, and I conclude that the game is up, but a powerful stroke of the paddle, wielded by my brother's nervous hands, averts that danger.

Five, eight, ten minutes of the incessant strain, and I am actually getting tired, and, fortunately, so is the fish. Once more I pursuade him to imitate the immortal Andy and "swing around the circle," and by standing upright on the seat I succeed in compelling him to contract his orbit. "Ready with the gaff, John, strike." John's movement was sure, his aim strong, and the fish was quickly lifted from his native element and deposited in the boat. Twenty-four hours after being taken from the water he pulled the scales down to seventeen and a half pounds.

Hardly was the muscalonge in the boat when a strong breeze from the west sent the whitecaps rolling in upon us with such force that our low-sided boat shipped more water than was at all agreeable. Running in close to the shore, and finding somewhat of shelter behind a long strip of rushes, we endeavored to work our way around a headland, where the water would be comparatively calm, but it was slow, toilsome work. "O for a drink of good cool water," murmurs Jacob, wiping the perspiration from his flushed face. "All right," I answer, "pull for that bunch of willows. Unless the drought has dried it up, a spring brook runs into the lake there." Springing from the boat, I found the bed of the brook quite dry, but by following it up twelve or fifteen rods I found a spring of beautifully clear cool water, on the margin of which stood a sleek fawn. What a beautiful jacket the little fellow wore, and what a look of innocence and trust in his large limpid eyes. Keen sportsman that I am, I would no more have shot that fawn than murder the son and heir of my dearest friend; and to my notion a man who will kill a fawn, unless it is a question of meat or starvation, ought to be hung without benefit of clergy. As I advanced to the spring the fawn bounded away, leaving me in peaceful possession. Shouting to my companions to come on, that I had found the spring, I waited for them several minutes, and as they failed to come, I took a short cut for the boat. They were not there. Three-quarters of an hour later they put in an appearance, puffing like porpoises. They had tracked me to the spring, and finding no return tracks, jumped to the conclusion that I was lost, and had been running and shouting through the woods. Peace was restored by my promising not to leave the boat again unless a hook was fastened to my coat tail, with the end of the line tied to Jacob's finger. After a hard pull, and no little danger of swamping our overloaded craft, we reached the extreme northern end of the lake, and landing upon the white sandy beach passed a quiet yet pleasant hour in gathering shells and culling rare and fragrant flowers in the adjacent woodland. A few yards from the water side, in a thicket of rushes, we found where a bear had recently made its bed, and judging by the fish bones lying around, concluded that his bearship was a fisherman of no inconsiderable skill. His tracks, in the wet and yielding sand, demonstrated that he was a monster in size. A few months later a neighbor of mine, only a short distance from the lake, shot a male bear, which weighed, after the entrails were removed, 350 pounds. Perhaps he was the one whose bed we found.

Launching forth once more, we pulled down the western shore, where the heavily timbered bluffs largely sheltered us from the force of the wind and made fishing possible. Near the inlet of the lake—it has no known outlet—we cast anchor and wet our lines again. For quite a while only sun perch deigned to notice our plebeian bait, and then, as suddenly as the evening before, the battle opened all along the line. Jacob comically compared the sunperch to sappers and miners, doing temporary duty as skirmishers and covering the approach of the main body. The pickerel he classed as cavalry, bass as infantry and pike as heavy artillery, and certainly they came down upon us horse, foot and dragoons. They came but returned not. When we repaired to dinner forty-seven fish, averaging 3 lbs. 10 ozs. each, were taken from the boat, and this with the muscalonge not reckoned. Let no one have the notion that we were catching fish simply to have them cast aside and wasted. Every fish was cleaned, salted and packed down, both of my companions being desirous to secure half a barrel for future use.

About 3 o'clock in the afternoon the wind moderated to a gentle breeze, and we decided to row up the eastern shore of the lake and once more try the cove where the muscalonge was captured. "I say, Colonel," exclaimed John, turning to me as we were about entering the boat. "I'll put up a target on that oak yonder and try you three shots with my rifle; if I make the best score you shall do all the rowing this afternoon, and if you beat I'll handle the oars." "Agreed! Up with your target and fire your three shots."

I knew that John was an extra good marksman with the rifle, and also that from long use thereof he had unlimited confidence in his gun. My only hope of success rested on the certainty that after his first shot John would become slightly nervous, while I, on the contrary, as my chances diminished, would become calmer and steadier. I wonder if I am an exception in this peculiarity? I can do as poor shooting with the rifle as any man I ever saw, and yet if anything of importance depended upon it, my nerves would be under absolute control and my shot would be a center one. The target, a bit of paper an inch square, was fastened to the oak by a nail through the center, fifteen rods paced off, and John blazed away. All three of his shots, the first being the best, left their impress on the paper, but the nail was untouched. My first shot equalled his poorest one, my second his best, and my third drove the nail. "Confound it," muttered John, "I might have known better than to have arranged for more than one shot with you. I can always beat you on a single shot and you are sure to win if we try three."

Arriving at the cove Jacob was the first to wet his line, and almost instantly he raised the shout, "I've got the big brother of your muscalonge, Frank!" But instead of that being the case, his line after a very brief but vigorous contest came up minus the hook. My first cast—and I had that good old orthodox bait, a frog—was to the windward; even as the frog touched the water I started back in affright, for up from the depths below came a veritable monster, with huge distended jaws which snapped together with such force that my companions turned hastily to ascertain what danger threatened them. My poor frog appeared, in that enormous mouth, like a baby mouse in a railroad tunnel. "Hooked!" vociferated John. Yes, hooked, certainly; but then I had no expectation of holding the fellow with my miserable tackle. For a moment I held him near the surface, and then with a sweep of his tail that sent numberless drops of water into the air, he slowly and majestically retired, taking my hook and several feet of my line along with him. Up to date my property has not been returned. I know that a lost fish is always a "whopper," and the estimated weight usually exaggerated; but I am confident that the one of which I speak was fully four and a half feet in length and would weigh forty pounds. If any reader of FOREST AND STREAM doubts it and will come here next June we will go over and get the fish and settle all controversy.

"I know just how you feel, Colonel," said John, with a world of sympathy in voice and expression. "Please inform me then, for I really don't know myself." "Why, just as though you had popped the question and been shown the door." With a hearty laugh all round, though my merriment ended with a sigh of regret, we again addressed ourselves to business; but though we used every enticement at our command not even a nibble rewarded our efforts. The "leviathan" had evidently frightened all small fry away, and we finally pulled across to the inlet. There, as long as our frogs lasted—we had only secured a few from a meadow near camp—the bass bit ravenously, giving us magnificent sport. Frequently we would all be playing a fish at the same time, and once three noble bass, each securely hooked, vaulted into the air at the same instant.

Absorbed in our sport, we took no heed of external surroundings until a sudden gloom and the heavy rumble of distant thunder aroused us to the fact that the storm king had marshalled his forces and was swiftly sweeping down upon us. With long, powerful strokes John sent our craft toward the tent, which we reached just as the first large drops began to fall. The heaviest of the storm swept round to the southward and but little rain fell where we were; but up the lake we could see that the water was lashed to foam, the air filled with dust, leaves, and even large branches torn from the trees by the fury of the wind; the lightning glared and glinted against the somber background; how the thunder crashed and rumbled until the very earth quivered and trembled as if in terror at the elemental strife raging above. A few moments and the clouds had disappeared, the sun shone out, seemingly more radiant than before, and not a ripple disturbed the perfect tranquillity of the lake. We were not in the mood for fishing again that evening, and at an early hour we sought our beds of fragrant hay. I had been sleeping, I know not how long, when a savage growl from Dandy, who was serving as my pillow, aroused me to the consciousness that a cowbell was tinkling close to the tent,

"Don't let the dog out," exclaimed John, starting up. "and I'll catch that cow and get some milk for our coffee in the morning."

Pulling on his boots and seizing a pail in which to secure the coveted fluid, he sallied forth into the darkness, followed by Jacob, who was also eager for the spoil. "Coal Coal So, so," I hear them call in tones of dulcet sweetness. "Well, did you get any milk?" I inquired as they returned. "Milk!" snarled John, "that bell was on Lew Hansen's old horse."

Immediately after breakfast we went to the inlet and endeavored to obtain some minnows, but not one could be obtained, neither did a search of the meadows yield more than half a dozen frogs. To be sure we had a couple of trolling spoons in our outfit, but as neither of us was partial to that sort of angling we were obliged to return to the old bait. During the forenoon our success was exceedingly poor, scarcely a fish coming to the landing net, save "flatsides," with which the lake seemed to be literally swarming. I did have a moment of excitement, and in this wise. Tired of such poor sport I had allowed my hook to sink to the bottom, and was lazily watching a pair of loons out in the lake, when I became aware that my line was taut and the rod slipping through my hands. Springing up I pulled away and brought to the surface an enormous great turtle. Hook and sinker were out of sight down his throat, and there was nothing to do but cut the line as near his mouth as possible and let the ugly thing go. Drawing him close to the boat I reached over, knife in hand, to cut the line, when, presto, he sent the knife spinning out into the lake.

Our failure of the morning was amply compensated by the success of the afternoon; from four until five we actually worked too hard for sport. Off a steep bank, where the bottom afforded excellent feeding ground, we struck a school of bass and pike that seemingly had been fasting for days. My experience in fishing covers more than thirty years, and all the way from Maine to Montana, but the results of that hour surpassed any previous experience.

In the midst of our excitement there came the report of a rifle from the direction of the tent. Three times the rifle was discharged, with regular intervals of half a minute between each shot. "Up anchor, gentlemen; we must hasten to camp." "Why? What for?" "Those three shots were fired either by my wife or her order; it is a private signal to call me if within hearing. Listen, and if at the end of a minute two more shots are fired in rapid succession, they will mean make haste. Even as I spoke the two shots were fired. Reaching the tent, we found a messenger who brought the sad intelligence that not only was there sickness, but also death, in the village, and that my return was imperatively demanded.

So ended my trip to Long Lake. I cannot close, however, without a more direct word to those who may be planning for a summer's vacation. It is ten rods from where I write to the shore of Swan Lake, a magnificent body of water. Twenty rods northwest from the head of Swan is Mons Lake. Half a mile from Mons is Bass Lake. Less than a mile from Bass is Long Lake. Three miles west of Swan is Big Swan Lake, and two miles south is Moose Lake. All these lakes (they are from one to five miles in length) afford excellent fishing. I should be more than glad to show these lakes to any reader of the dear old FOREST AND STREAM who can honestly lay claim to being "a manly sportsman." No others need apply. J. FRANK LOCKE.

PILLSBURY, Minn.

EXPERIENCE WITH MINNOW BOXES.—Louisville, Ky.—Some time since I wrote you with reference to a minnow box, that is, what kind of box would keep minnows alive in lake water where there is no current. Would it be asking too much for you to ask your readers who have had experience in this matter to give their views?—L. T. R.

THE ICHTHYOPHAGOUS CLUB.—The following invitation has been issued and can be obtained by non-members if properly vouched for: DEAR SIR—The Ichthyophagous Club will hold its annual dinner at the Buckingham Hotel, on Wednesday, Oct. 21, at 6:30 P. M., and will be pleased to have your assistance in sampling the varied collection of aquatic life, which has been collected for experiment in determining its value as food. The Club points with pride to the very low rate of mortality at its tables, and the fact that the insurance companies no longer class its members as "extra hazardous." This result has been attained by not allowing the younger members to indulge too freely in *Enchytræus triventralopectinatus*, or in *Strongylocentrotus drobachiensis*, but in confining them to the safer and more palatable marine forms, like *Pleurobrachia rhododactyla*, trout from the Bigosh, and *Lutjanus blackfordii*. There will be several medical men present who will make no charge for attendance, the price of the dinner ticket ($5.00) being ample to cover everything. These necessary pasteboards may be obtained from the treasurer, Mr. E. G. Blackford, Fulton Market, for an equivalent in Treasury notes, silver certificates or Bland dollars. Trade dollars, mutilated coin and promises to pay will be turned in to the landlord. By order of JOHN FOORD, President; E. G. Blackford, C. R. Miller, Francis Endicott, Fred Mather, John H. DeMott, Committee of Arrangements.

ONE HOOKED AND ONE JIGGED.—Athens, Pa., Oct. 10, —I have just read in the last copy of FOREST AND STREAM how Mr. Leopold caught two bass. Mr. Frank Sherman caught two black bass this summer in exactly the same manner, he using small bullheads for bait. The one which took the bait weighed three pounds, the other nearly a pound, and was hooked on the side back of the gills.—PARK.

WORK AT COLD SPRING HARBOR.

[Read before the American Fisheries Society.]

BY FRED MATHER.

IN this paper will be given merely a glance at the work done at the hatchery, under my care, on Long Island during the season of 1884-85. The place is leased, and most of the work done, by the New York Fish Commission, although the United States Commission on Fisheries has considerable work done there. In the fresh-water department we can report:

A. SHAD.—On May 20, 1884, I received 80,000 shad eggs from Washington in compliance with my request to be allowed to experiment with them in spring water. They were placed in the McDonald jars, and on May 29 there was planted in the Nissequoge River, at Smithtown, Long Island, 72,000 fry. This seems to have been the first trial of hatching this fish in spring water, and as Col. M. McDonald wrote me that the success privately reported might revolutionize present methods, I will give the details in full;

[May 20, received 80,000 eggs at 6:20 P. M., put them in the jars at 7:30 P. M. Temperature of water 58° Fahr., of eggs 55°. Eggs began hatching May 24, finished May 27.]

Date.	Temp. of water.	Loss of eggs.	Loss of fry.
May 21	60	30	....
May 22	59	45	....
May 23	60	60	....
May 24	71	40	125
May 25	62	25	20
May 26	60	20	42
May 27	68	15	800
May 28	59	....	150
May 29	60	....	40
		235	
Dead on unpacking		380	
		615	1,177
Total loss			1,792

A similar trial made later proved a failure.

From the above table of losses and the round figures given as planted it will be seen that there is a discrepancy of only 208 fish and these are on my side. Further, my estimate of eggs received exceeds that of Colonel McDonald by about 5,000. The cool spring water, say of about 60 degrees (the mean of the above table is 60.7 degrees) seems to account for the absence of fungus on the dead eggs. Having hatched shad eggs in iced water (see Report U. S. Fish Commissioner for 1873, '74 and '75, pp. 372, 376) and on the rivers of the Atlantic coast from the Pamunky to the Connecticut, where it has often reached 80 degrees, I find spring water at about 60 degrees to be the best medium for shad eggs which I have used. In the summer of 1884 I made an examination of the shad fisheries of the Hudson for the New York Fishery Commission to find the best place to take eggs. There are several points on the river where eggs can be obtained, and these lie between Kingston and Hudson. The catch of fish during the season of 1884 was a very fair one, owing no doubt to the plantings by the State and by the U. S. Fish Commission.

B. BROWN TROUT.—On Feb. 24, 1885, we received from the Deutschen Fischerei Verein a box of 40,000 eggs of the brown trout (*Salmo fario*), half of which were billed to Mr. E. G. Blackford and the remainder to me. The loss in transit was 1,020 eggs and we afterward lost 2,594 eggs and 3,131 fry; 28,900, according to our estimate, were planted in Queens, Suffolk, Westchester and Rockland counties, N. Y. These fish are destined to become great favorites and the demand for them increases.

C. BROOK TROUT.—We received 7,000 eggs from the United States Fish Commission at Northville, Mich., Frank N. Clark, Superintendent, and a lot of Rangeley and blueback trout eggs from the Maine Fish Commission on account of Mr. Francis H. Weeks, of Cold Spring Harbor, but which were so arranged that we could not tell which was which, and no careful estimate of the number was made, as a mistake occurred in shipping; probably there were 50,000 in all. These together with some 16,000 eggs taken from our ponds were hatched and distributed on Long Island.

D. RAINBOW TROUT.—From 20,000 eggs received from the United States Fish Commission, Northville, Mich., we hatched and distributed 14,500 in Kings, Queens, Westchester, Suffolk and Rockland counties, N. Y.

E. SALMON (PENOBSCOT).—From 500,000 eggs received from the U. S. F. C. station at Bucksport, Maine, Mr. Chas. G. Atkins Supt., we planted 269,300 in the tributaries of the Hudson in Warren county; 99,350 in the tributaries of the Delaware, in New Jersey; 46,000 in the Oswego River, and 4,900 on Long Island. The success of former plants in the Hudson is announced by Mr. A. N. Cheney, of Glens Falls, N. Y., who says they are plenty in Clendon brook and promises specimens.

F. LAND-LOCKED SALMON.—Of 60,000 eggs of the land-locked salmon presented to the State by the U. S. F. C., only 16,300 fry were distributed owing to their being retarded in troughs too long awaiting orders. The fish were assigned to Adirondack waters, but for lack of orders were finally distributed on Long Island.

G. WHITEFISH.—We have favorable reports from former plantings of whitefish on Long Island, but lack specimens and

therefore have no proof that they have lived. From one million eggs we distributed 990,000 fry as follows: 600,000 in Great Pond near Riverhead (where success was reported); 340,000 in Lake Ronkonkoma, and 50,000 in St. John's Lake, Cold Spring Harbor.

H. SMELT.—The result of experiments with these refractory eggs will be found in another paper read before the Society yesterday, and there is nothing new to add.

SALT-WATER DEPARTMENT.

A. CODFISH.—Owing to bad weather and perhaps other causes, no good eggs of the cod were taken. There has been no decided success in the hatching of this fish, although a few have been hatched by Capt. H. C. Chester and Prof. J. H. Rider, both of the U. S. Fish Commission. This fall we hope to have a smack come in to the station with live cod and try to obtain good eggs.

B. TOM-COD.—With these eggs we have good results. We took 280,000 and turned loose 213,000 fish. The eggs are not adhesive like the smelt's, nor buoyant like the cod's. These hatched in about twenty-five days.

This record shows that between two and three million eggs were placed in the troughs at this station, and besides this there were over 3,000 more handled and repacked for foreign shipment, or received from foreign countries for hatcheries in America, all the foreign receipts and shipments passing through my hands for inspection or repacking, in which great successes have been scored. We propose to begin the artificial culture of oysters this summer.

FIXTURES.

BENCH SHOWS.

April 6, 7, 8 and 9, 1886.—Second Annual Dog Show of the New England Kennel Club. Jean Grosvenor, Secretary, Boston, Mass.

FIELD TRIALS.

Nov 9.—Second Annual Field Trials of the Fisher's Island Club, for members only. Max Wenzel, Secretary, Hoboken, N. J.

Nov. 9.—First Annual Trials of the Western Field Trials Association, at Abilene, Kan. Entries close Oct. 15. A. A. Whipple, Secretary, Kansas City, Mo.

Nov. 12.—New Jersey Kennel and Field Trials Club. Field trials for members only at Fisher's Island. A. P. Vredenburgh, Secretary, Bergen Point, N. J.

Nov. 16, 1885.—Seventh Annual Field Trials of the Eastern Field Trials Club, High Point, N. C. Entries for All-Aged Stakes close Nov. 1. W. A. Coster, Secretary, Flatbush, L. I.

November.—Fourth Annual Trials of the Robins Island Club, Robins Island, L. I., for members only. Wm. H. Force, Secretary.

Dec. 7.—Seventh Annual Field Trials of the National Field Trials Club, Grand Junction, Tenn. Entries for Derby close April 1. B. M. Stephenson, La Grange, Tenn., Secretary.

A. K. R.—SPECIAL NOTICE.

THE AMERICAN KENNEL REGISTER, for the registration of pedigrees, etc. (with prize lists of all shows and trials), is published every month. Entries close on the 1st. Should be in early. Entry blanks sent on receipt of stamped and addressed envelope. Registration fee (50 cents) must accompany each entry. No entries inserted unless paid in advance. Yearly subscription $1.50. Address "American Kennel Register," P. O. Box 2832, New York. Number of entries already printed **2704.**

THE PHILADELPHIA DOG SHOW.

THE autumn dog show of the Philadelphia Kennel Club in conjunction with the Pennsylvania State Agricultural Society was held at Germantown Junction, near Philadelphia, last week. On Thursday, the opening day, it rained steadily all day, on Wednesday the weather was raw and cloudy and on Thursday there was a light rain which lasted through the day. Friday was the only really pleasant day of the four, the attendance, however, was very good and the department devoted to the dogs was one of the chief attractions of the fair. The management of the show was the worst we remember to have seen; the dogs were benched in the open cattle sheds. This would have been all right, so far as the comfort of the animals was concerned, had the weather been good, but in the rain and cold it was "cruelty to animals" to keep some of the more delicate specimens shivering in the draught that came through the open sheds. If there are not many resulting cases of sickness we shall be greatly surprised. The arrangement of the benches was such as to exclude the light from the dogs, and even when the sun was shining it was impossible to obtain a decent view of a large portion of the exhibits; this was especially the case with the small dogs. We understand that the Fair Association has decided to erect a suitable building for the show next year, and that the space and accommodations will be ample and complete.

There was no superintendent, and, as is always the case when there is no responsible head to direct the management, there was much confusion and delay. A few members of the Kennel Club worked like beavers and accomplished a great deal, but many things that should have been seen to were left undone until some one could be found to attend to them. Not enough attendants were employed and the judging dragged in consequence. The dogs appeared to be well cared for and had plenty of good food and water. The judging rings were on the ground under open sheds, and were cold and muddy. Straw was strewn on the ground, but this made it impossible to judge of the movements of the dogs. A large portion of the judging was done on the first day, and it could have easily been finished had the classes been properly handled. There were 467 entries, which is about one hundred less than last year. More than one-half of the falling off was in the fox-hound classes. The pointers had two more and the setters twenty-eight less. There were some changes in the numbers of other classes. Taken as a whole, the show of dogs was a good one, but the quality in many of the classes was not equal to that of last fall, although there were many excellent animals present. The condition of the dogs was not so good as is generally seen at the spring shows, although some of them were in capital form. Many of the kennel displays were excellent and added not a little to the attractiveness of the show. There was a serious fault in the management in allowing exhibitors to bench together entries in several different classes. Much confusion resulted from this, and it was no small task to unravel the mystery and get the classes together when wanted in the ring. This arrangement came especially hard upon the reporters, who were obliged to put in a vast amount of extra labor in hunting up the animals wanted. Although we do not agree with all of the decisions of the judges, we believe them to have been made in an honest and impartial manner, and have no fault to find in this respect. Had the judge an equal chance with the reporter as to time to examine and compare the different animals we are confident that the conclusions reached would be much more harmonious than is often the case. Following are our comments upon the dogs:

MASTIFFS—(MR. DUDLEY).

The Winlawn Kennels exhibits saved these classes from mediocrity. Homer and Prussian Princess represented the champions, and although each was shown much too light in flesh they were entitled to championship honors. In the open dog class Dread, who has improved considerably since we last saw him, had no easy task in beating Jim, whose good body and size are weighed up in the scales by his rather houndly head and heavy ears. Terror will never be a terror to opponents on the show bench, but his wolfish head would scare away the most daring of burglars. Although Rosalind was shown too thin her numerous mastiff qualities put her far ahead of everything else in the class. Liberty, Hebe, and Dido II. have all been fully criticised in these columns; the latter, having the best head of the three, took second. There was not a good puppy in the show, not one that will distinguish itself at future shows. Mr. Colwell's David has not improved, and the same may be said of Brother. If Terror was worth third prize in the open dog class, he certainly was worth more than a c. card in the dog puppy class; but we think Mr. Dudley overestimated his worth in one class and upon a second examination pegged him back to his right place. Penelope, just a fair specimen, is faulty in muzzle, ears and eyes. Dora is too long in face, and has heavy ears and bad feet. Mr. Harvey's exhibits show no signs of good breeding. Miss Hildebert has a good body, but is faulty in head, ears, pasterns and tail. These classes were well judged.

ST. BERNARDS—(MR. DUDLEY).

There were no entries in the champion classes for rough-coated dogs and bitches. In the open dog class, First Choice not looking quite so well as we expected to find him, scored a creditable first, followed by Hero, a new comer. He is fairly good in head, legs and feet, and is above the average in size. Julien has not improved very much upon his Boston form. St. Maurice, catalogued a brindle and white, is a black and white dog, and would stand a fair good chance of taking honors in a class of Landseer Newfoundlands. The judge erred in giving him a commended card. He is good in head and body, but is not a St. Bernard. Stella, not looking at all well, won in the bitch class. We did not see Bertha off the bench, so must pass her. Norah, a well-bred one but scarcely up to show form either in head, tail, strength of limbs or size, came next. Beryl is out of coat. Sheila, with a healthy-looking lot of puppies, was in fair condition. Rough-coated puppies were a poor lot. Julien, who took third in the open class, was about the best of the lot. He has plenty of bone, and is faulty in head; his worst faults are behind the fifth rib. Lys, the second prize winner, requires care; his pasterns and feet are growing the wrong way. Victoria, vhc., has a passable head and a good body, but her straight pasterns, markings and awkward gait will prevent her from rising high in the St. Bernard world. Verone, a much improved (by nature) dog, won the championship for smooth-coated dogs, but the corresponding class for bitches did not fill, and in the open dog class Ernst had matters all to himself. He has good forelegs and feet, and is above the average in body; his head is plain. We made several calls upon the winning bitch Bess, but could never get a glimpse of her. Snowball, placed second, is faulty in head, bone, feet and size. Abra was too fat by half, but we liked her better than Snowball. Belline II., vhc., is good in body but is faulty in head, size and in bone. None of the puppies will ever be heard of in good company. Prince was well-placed first. He has a fairly good head and a good body, but is straight behind, moves badly and is not marked in the style required by the *cognoscenti*. Belline II., mentioned above, and Lionel were badly shown, and will never be seen to worse advantage than they were upon this occasion. Their heads are not typical. If Nellie would carry her ears better, she might earn two more letters. Taken altogether, these classes were well handled.

NEWFOUNDLANDS—(MR. DUDLEY).

Sam—who doesn't know Sam?—took another champion prize to Boston. We thought him looking well. Bruno took first in the open class, and we are glad to see that Mr. Dudley has at last recognized his many good qualities. He was away ahead of any in the class, and being a much better specimen than Sam, should have taken the special prize. The judge must have been severely taxed to find a second prize winner, and Carlo was the lucky one; but he is not a show dog, being faulty in head, ears and coat. Fido too is a poor specimen, curly in coat and faulty in head. Hero is leggy, short of coat and light in bone. Rover did not deserve a card. He has a ring tail and bad head and poor coat. Nell took first at a previous show under the same judge, but as we stated at the time, did not deserve it. Now she takes a c. card, which is just one letter too much. Our comments upon her when last shown are correct.

COLLIES—(MR. APGAR).

Ben Nevis and Rex were the only champions entered. Ben is not half the dog he was. He is growing coarse in head and is out of coat. Rex looked fairly well. Royboy, who made his bow to the public, has many good points. His head is much above the average, he has a good frill and is fairly well built all through. His ears are well placed, but they don't sit quite right. We would like him better had he more coat, especially in the place where it is most needed. Robin Adair II. is good in frill, but his heavy skull, light eyes and scanty coat will keep him from the coveted position. Joe Nettles, who took third, has not improved upon his puppy form either in coat or in skull. In the bitch class Mavis, who took first, is not a good one; her worst faults are in ears, feet and pasterns. Wanda, who lacks in top coat, undercoat, frill and in skull, came next, with Meg, faulty in head and ears, third. Gem was in shocking condition and was very properly discarded. Jeannie Nettles, faulty in head and ears and woolly in coat, was given c. Dot, short of coat, heavy in ears, faulty in shoulders, was given hc. This was a very poor class and the puppies were even worse. Dot, just described, took the blue ribbon from Mr. Lindsay's Portland. We do not remember having seen this dog win a first at New Haven, as claimed in the catalogue; but if he did, time has done much in the way of making him worse, not only in head and ears but in coat and symmetry as well. Daisy, faulty in head, ears, coat and in stifles, took third prize. We hope never again to see such a lot of puppies at any show. The classes were carefully and well judged. The special prize for the best collie shown by a member went to Ben Nevis. That he can beat Royboy when in condition we do not doubt; but he could not have done so upon this occasion had they came together. The collie trials were a failure and no prizes were awarded.

DEERHOUNDS—(MR. PIERSON).

Mac, looking well, beat Heather for the champion prize. The latter was in wretched condition. There was only one specimen in the open class and it was given second prize, but for what reason we do not know, as it is a very poor specimen.

GREYHOUNDS—(MR. PIERSON).

Old Memnon, whose grand form we never tire of looking upon, was alone in the champion dog class. Greyhound men should take a long look at this game and almost perfect piece of dog flesh ere he retires from the bench. In the corresponding class for bitches Mother Demdike fairly smothered Fan, who never could have taken her numerous prizes had there been any "greyhounds" to meet her. The open dog class was a poor one; Ben, who took first, should be retired for reasons previously given. Wertheim, placed second, is not a show dog. The open bitch class introduced us to Mr. Smith's recently imported Stealing Away; she is a good greyhound, although not first-class, but is, of course, much better than such dogs as Friday Night, Fan, etc.; her head is too coarse, and she is not "filled up" below the eyes; back and quarters above the average; chest, legs and feet good; shoulders heavy. Second prize should have been given to Saturday Night, fully criticised in our report of the Philadelphia Kennel Club's May show. Lady Halifax, the fortunate recipient of second prize, has bad ears and a poor, expressionless head; she is leggy, shallow and faulty behind; not a show dog at all. There was only one entry in the puppy class, and it must have found its way there by accident, why such a specimen—faulty all over—should be awarded premier honors at a dog show we know not; the dog or animal, we cannot call it a greyhound, has a wretched head and ears, hindquarters such as we have never seen on a prize winner before, bad legs and feet, poor loin, and does not show the least bit of greyhound character; if this and the like awards are passed by unnoticed, much harm may be done to those who have no opportunity of seeing the dogs. Here is a dog which cannot be called a greyhound by any greyhound breeder, and yet he may be advertised in the public stud as a first prize winner. What would be the result?

POINTERS—(MR. SEITNER).

The pointers as a whole were not quite up to those shown there last fall. We could by no means agree with the judge in all of his decisions. We have had some experience with pointers within the past forty years, and long ago determined that weak chests, bad shoulders, slack backs, faulty legs and feet, light loins and feeble muscles were not the requisites of the pointer; that many animals possessing some of these characteristics are very taking to the eye is not to be denied; that they can go and stay we have yet to see demonstrated, and until all such are religiously excluded from the front seats of the show bench, the improvement of this grand breed of dogs will remain in abeyance. Our comments upon many of the dogs have already been published in reports of previous shows, and it is not necessary to repeat them here. There were no entries in the champion large classes. In the open dog class Donald II. was rightly placed first. He is preparing for the field trials, and was not quite up to the form he showed last spring, although he was looking well. There was not much to choose between Jimmie, second, and Bangor, third. Dan, unnoticed, was entitled to second place. He is a big lemon and white, with good head, back, loin, legs and feet, and moves nicely; he is rather coarse, but has a capital coat and shows quality. On the other hand he is too wide in front and is throaty, and was shown too fat. The other two entries, Rock and Rye, evidently have Irish setter blood in their veins, and were properly unnoticed. In the bitch class first was withheld and Beulah was awarded second. She won first at the same show last fall in a better class, and was clearly entitled to the same place here. She was shown too fat. Nelly, third, and Polly Varden, unnoticed, were fair specimens only. Polly we thought a trifle the better of the two. Her worst fault is a wide and shallow chest. In the champion small class Mr. A. H. Moore's Donald was alone. He was looking fairly well, and was for exhibition only. In the corresponding bitch class Daisy Bravo had a walkover. She has improved since we saw her last, but was not in first-class condition. In the open dog class Shot was entitled to his first; he has greatly improved since last spring, and was shown in capital condition. There was not much to choose between Castor, second, and Adonis, third. Castor has improved since we saw him last. He has the best of it in head, but Adonis beats him in legs and feet. Prince of Orange, vhc., has improved, was well shown, and deserved his card. Dash, hc., has a setter look about him that we do not like. The bitches were a better class and nearly all of them were in excellent condition. Those belonging to the Westminster Kennel Club were brought into the ring in better form than we have ever seen them. Lucky Stone, winner of first, was in elegant condition, but still retains her faults. Lady Belle, second, is a fair bitch only, not yet mature; her ears set too high and she is light in bone. Bellegarde, third, is also just a fair specimen; her ears hang badly and she lacks substance. Lady Maud, vhc. reserve, is a very good bitch, with a fair head and chest, and capital loin, quarters, tail, legs and feet. All of the others we have frequently commented upon. The awards in this class were all wrong. Lady Dufferin, hc., should have been first. She is a typical small pointer, with fewer faults than any in the class. Next to her we would put Lady Maud, with not much to choose between Rosa, vhc., and Virginia, c., for third place. The dog puppies were a very ordinary lot, and we saw nothing to lead us to believe that either of them would make a future winner. The bitches were much better. Leda, the winner, is rather an ordinary bitch, with bad color and is a bit shallow in chest, and lacks character. Genesta, second, is a fair bitch, except that she is weak in head and has a coarse tail. Dorcas II., vhc., we liked and thought that she had an easy win. She has not a very good head and her tail is a bit long, but otherwise she is very good and well deserved first. Puritan, unnoticed, was the youngest and smallest of the lot. She has few good points.

ENGLISH SETTERS—(MR. WESTCOTT).

The English setters were not up to those of last fall, either in numbers or average quality. In the champion dog class Rockingham was alone. He is preparing for the field trials and was not at his best in coat and feather. He was looking, however, better than we have ever seen him. His field work has hardened him and given him a wide-awake appearance that he did not possess before. In the bitch class Petrel II. was also alone. She was very short in coat and feather, but otherwise in fair condition. In the open dog class first went to Glen Rock. He was in the best show condition of any in the class. He is a very taking looking dog with beautiful color and markings. Tug, the winner of second, was not in the best of condition, although he is looking well. He is not quite so good in stifle as the winner, but beats him in head and quarters and is his equal at other points, had their positions been reversed it would have been about right. Don Juan was third. We have never seen this dog in first-class form but once; he was then a very hard dog to beat, but when out of condition he appears to great disadvantage. Storm Petrel, vhc., has improved and is very near the winners. He is not yet mature and must bide his time. Dashing Monarch received his usual hc. He was looking well. In the bitch class first went to Modesta. She was well shown and fairly entitled to the place. Blitz, second, should not have been in the money. She is a taking looking bitch with a good head and neck and fair shoulders. She is very weak in second thigh and pasterns and has very bad feet; there were a dozen better ones in the class. Third went to Fairy III. She was out of coat and feather, but should have been second with Dame Petrel, vhc., next. Dame has improved greatly and is one of the most symmetrical bitches in the class. If nothing befals her she will go higher up next year. Countess Warwick, also vhc., is a rare good one; she stands a bit high and is just a trifle short in body. She also carries her tail much too high. Petrel III., also vhc., was shown too fat. She was also out of coat, as were nearly all her kennel companions. Coomassie was very lucky to receive the three letters; one would have been plenty in this company. She should at least have exchanged places with Blue Belle, hc. Pebble, unnoticed, is a very well-formed animal and deserved the three letters. The dog puppies were a sorry lot. Tug, Jr., winner of first, should not have been noticed; he is big, lathy and leggy, and has a shallow chest, to say nothing of his deformed breast bone, which should disqualify him. Soudan, second, was rightly placed, his ears set too high and he is too long coupled. First should have been withheld; there was nothing promising in the class. Bella, first in the bitch class, was not entitled to the place; she has a coarse head, carries her ears badly, is throaty, too wide in chest, and has a bad tail; she is good in back, loin, quarters, legs and feet; vhc. would be about her mark. Glen Ada, the winner of second, was rightly placed; she is rather coarse, with no stop, and her ears set too high, she is also throaty and long in loin. Princess Kate, vhc., was the best in the class, she is a capital little bitch and will do to show again; she is weak in muzzle and her ears might hang better, her hindlegs also might be improved; she has a fair head, good body, chest and forelegs, and carries a good tail. Idylwoof, hc., promises well, and was worth her card. Nellie, unnoticed, we also thought worth mention.

IRISH SETTERS—(MR. WESTCOTT).

The Irish setters were a good lot. Chief, looking well, was alone in the champion class. Berkley was entered but not for

competition, except that his coat was in bad shape, the old champion appeared to be about as good as ever. In the bitch class Lady Clare also had a walkover. Her maternal duties have pulled her down and she was not in good form. Old Lou II., for exhibition only, has grown almost white with age. In the open dog class Blarney won over his son Bruce. In our comments upon the dogs at New Haven last March we said: "Blarney, vhc. reserve, is also very good. He is not yet mature and his color is not yet right. He will improve in this respect, and when he fills out we shall look for him among the winners." He has greatly improved, and as we said of him last May, "He has the head of an Irish setter, and he is an Irish setter." Bruce II. was looking well and deserved his place. Chief II. was placed third. He was well shown, but should have made way for Elcho III., a better dog. He has a grand head and is well formed, with no serious faults. His coat was broken and showed want of care; but notwithstanding this he should have been third. The others we thought well placed, except that two or three more cards would not have been out of place. The bitches were a fair class only, they were as well placed, perhaps, as was possible. The dog puppies were nothing extra. There were only two bitch puppies shown. Nellie, the winner, is a very nice bitch and if she goes all right she will do to show again.

GORDON SETTERS—(MR. WESTCOTT).

The catalogue called for Gordons, but the judge was instructed to include black and tans. Turk, looking well, won over Argus, in bad condition, in the champion dog class. In the corresponding bitch class, Rhoda, the only entry, was absent. Royal Duke won first in the open dog class. He was well shown. Second went to Bob, a Gordon and Irish; he is a very well-put-together dog, of good color and markings, and a nice flat but rather short coat. Don, third, is rather a good light-weight. In the bitch class, first went to Nora, a very nice bitch, with a good, clean-cut head. She is well formed and shows lots of quality. The others were nothing remarkable. There were but two puppies shown; both were only moderate.

SPANIELS—(MR. WINSLOW).

There were but two entries in the Irish water spaniel class. Both were seedy specimens, and first was properly withheld. Dash, the winner of second, would hardly pass muster in a good class. Charley, unnoticed, is a nicely-made dog, but was all out of coat and his topknot was entirely wanting.

Black Prince, looking well, was alone in the class for champion field spaniels. In the open class it was a close thing between Pluto and Newton Abbott Lady. Lady is well known, and we have repeatedly called attention to her good and bad points. Pluto is rather a nice dog, possessed of many good points. His ears do not hang quite right, his eyes are too light in color, and he is a bit leggy. He has a fairly good head, but might be better in stop and end of muzzle. Pascha has a pretty good head, but is curly and light of loin. Coaley lacks in head and has light eyes; we would have given the third prize to him instead of Pascha.

Brahmin had no difficulty in beating Hornell Silk in the champion cocker class. He is a niceish little dog, and but for a little legginess, lightness of bone and heaviness of brow would take a lot of beating. In the open class for dogs Othello had a very easy victory, but he has not improved; on the contrary, he is growing worse in head, he has not let down enough, and although his coat is straight, he has not enough of it. Hornell Jock is faulty in head and his ears are badly placed. Obo, Jr., was in such wretched condition that he should not have received notice of any kind. Nigger is well known. Belle won with a good deal to spare in the next class. Miss Nance is faulty in head and in forelegs, which are not straight. Hornell Flora is faulty in head, feet and legs. In the class for cockers of any other color than black or liver, Marion, the Boston winner, took first, and is well known. Second prize should have been withheld for want of merit. Alice Obo was the best of a very poor lot. She is too light all over. King Cole, who took second, is faulty in head and his ears are badly placed. Wonder and Hornell Sport did not deserve vhc. cards. Neither is worthy of notice in a class of spaniels.

Among the Clumbers, Newcastle had only Tyne, a fairly good bitch, and a dog without ears, to beat, and he did this handsomely.

FOXHOUNDS—(J. HOWARD LEWIS AND MARK PENNELL).

Thirty foxhounds were on show, including the two drafts of six couples each from the Rose Tree and Cheyney Hunt Clubs, competing for the prize for the best pack. In the champion class there were no entries. For the best dog in the open class, Jerry, a capital black, white and tan of the Cheyney Hunt was given first place. Second went to Ringer, a handsome blue mottle of the Lionville Hunt. Third to Whiskey, black and tan, a fine upstanding hound, also of the Lionville Hunt. Roxey II. was placed first in the bitch class, and Jessie, of the Cheyney Hunt, second; both are handsome bitches and full of quality. In the puppy class only two competitors faced the judges, the tan bitch Cricket receiving first. Only two packs were brought before the judges to compete for the pack prize of $50. The Cheyney Hunt received the award, beating the famous Rose Tree. Through an oversight the Rose Tree hounds were not entered for competition in any of the open classes, else the character of the awards might have been materially changed, as there were individuals in this pack of the most pronounced hound type.

BEAGLES—(J. A. STOVELL).

The class was a large and good one, showing that the interest in this popular breed is steadily advancing. At the earlier bench shows beagles were usually a small exhibit, and many of the entries were only beagles by courtesy. Since the advent of the Beagle Club and the establishing of the standard there has been a marked improvement in the quality of the dogs shown and a generally better appreciation by exhibitors of what the true-bred beagle should be. In the champion class, over 12 inches, Rattler, Bannerman and Lee were brought together; however, before adjudication commenced it was discovered that Bannerman was not eligible to compete under the strict ruling of the prize schedule, being under 12 inches. The contest, therefore, narrowed down to Rattler and Leo. Rattler won, but many beagle men differed from the judge in this decision and for the following reasons: Lee is more cobby, has a stronger back and a better arched loin, and a better bent hindleg. Rattler, besides being inferior to Lee in the points named, has become very fat and cloddy, his chest is let down like the brisket of a shorthorn bull and his shoulders are thick and loaded. Such a dog simply cannot run and last. Old Lee, bearing his years well, still shows the good beagle that he was in his palmy days. He is one of the few pure Roweths now living, a family, which if allowed to become extinct, beagle fanciers will always regret. Bannerman was shown in fine form. This little hound has been fully described in the FOREST AND STREAM and is a popular dog. Mated with overgrown bitches the progeny will almost certainly be within the height limit of the standard. This, without counting his symmetry and quality, will always give him value as a stock dog. A special champion class for beagles under 12 inches was made and Bannerman was awarded the prize. In the open class for dogs over 12 inches, Rattler III. received first honors. He secured timid in the ring, and did not do himself full justice. He has well-hung ears and is of taking color. His defects are that he is rather long cast and his tail shows a slight kink; in other respects he is very good. Kino, awarded second, is a cobby dog, but his shoulders are loaded and thick, and he is extremely throaty. King Pat, a neat white, black and tan, is a better dog, and should have been second. Duce, a good-bodied black, white and tan, whose ears are a trifle short though well carried, was deservedly placed third. Trailer, a good-looking useful hound, was ruled out by reason of being over the standard height of 15 inches; as also was Ring, another good-looking dog. Fleetwood lacks substance somewhat, being a trifle leggy. March is defective in ear and lacks in other essentials. In the open class for bitches over 12 inches Mischief was placed first. There seemed to be considerable discussion as to this bitch's eligibility in this class, it being claimed that she had won three first prizes already, and consequently should properly have been in the champion class. The matter hinged somewhat on the question of identity also, her owner asserting that the bitch was Mischief II., and that she was in her proper class. There being no protest entered, the judge decided to accept her. Millicent, placed second, is in poor condition from nursing a litter. She is cobby and has good feet. Flight, winner of third prize, is a very taking beagle. She has a beautifully arched loin, capital legs and feet, her tail lacks brush; she might be rather closer to the ground, and her head needs a little more beagle character. With these exceptions she is very near the mark, and many good beagle judges thought she deserved the first place. Music is another good one and deserved a vhc. Fashion and Lucy both ordinary; the former lacks beagle character.

In beagles under 12 inches, Marchboy II., looking thin and weedy, got first. He has not improved on his puppy form. Magnet, winner of second, is better in essential points, and the positions should have been reversed. Fannade, who got third, is long cast and flimsy. Prince has suspicious-looking forelegs, savoring of a bench-legged ancester. Diamond is a fair little bitch and deserved recoguition, as also did Zora. The best puppy under 12 months is Cricket. She got first and deserved it. Topsey, who, by the way, is a dog puppy, was second, which award is indorsed, and Letter got commended. Music, weedy, Gypsey, very ordinary, and Daisy, showing unmistakable bench-leg cross, finished the list.

BASSETS AND DACHSHUNDE—(J. A. STOVELL).

Bertrand, lacking in haw and peak, and not as good in crook as his competitor, Nemours, pleased the judge's fancy most for first. He is a dog of great substance, and excels Nemours in muzzle, flews, chest and ribs, but falls behind his competitor in the points enumerated above.

One dachshund and three bench-leg beagles competed for the dachshund prizes. Waldine, a true dachshund but of no very marked quality, received a second. The others were very properly passed.

BULLDOGS—(MR. MORTIMER).

Bellissima, not looking very well, had the champion class to herself, and in the open dog class Remus had an easy task to beat Crib, not "up-faced" enough and prick-eared. With Britomartis in the open class, Bonnie Duchess and Duchess were outclassed. Bonnie Duchess is too long in muzzle and has a bad eye. Duchess is light in skull and long in muzzle, besides being cowhocked, light of bone and faulty in feet. In the puppy class Mr. Thayer's Ramona was alone. She is small in skull and wanting in chop; just a fair specimen. Mr. Thayer had it all his own way in these classes, there being nothing to approach his dogs in good looks.

BULL-TERRIERS—(MR. MORTIMER).

No champions faced the judge. In the open dog class Dutch, Jr., was the only exhibit worthy of a prize. The winner in the bitch class was much the best. In skull, body and legs she will do, but she is faulty below the eyes, is a bit lippy, full in eyes and faulty in tail. Gypsey is a bit faulty in head and has an objectionable tan marking over one eye, still she was about second best. Violet is cheeky and falls away under the eyes, she is also too leggy and narrow in front. Only two puppies were shown, and The Baron, who promises well, beat Mac (a poor specimen) easily. We were surprised to see so few entries in these classes, as bull-terriers are becoming very popular. They were properly placed.

BLACK AND TAN TERRIERS—(MR. MORTIMER).

There was only one entry, a poor specimen.

FOX-TERRIERS—(MR. MORTIMER).

Raby Tyrant and Richmond Olive saved the champion classes from failure. In the open dog class first was given to Regent Vox, who is a catchy-looking dog, but he is light in bone, weak in pasterns, faulty in feet, soft in coat and light in muzzle. His beautiful markings and nice condition got him the prize, which should have gone to the more workmanlike Scarsdale, whose good and bad qualities are well known to our readers. Richmond Jockey, third prize, has a good head, but is light and faulty in feet. Dan, vhc., was in luck's way. He was in bad condition, is sour-faced, light in bone and faulty in feet. Hapton Toby, hc., is a much better dog than Dan. His ears are not well carried and he would do with more strength of jaw; he is also a bit cheeky and slight in coat. His body is good and his legs and feet are of the best. What the judge saw in Brokenhurst Spice II. to commend him we cannot tell. He is a short-legged, cloddy dog, with a good pedigree and nothing else. In the bitch class, Delta, who has scarcely a tooth in her head, was given first over Thayer's Di, a decision which we cannot indorse. Delta has scarcely a hair to cover her skin, is light in bone, snipy and minus teeth. Without teeth a fox-terrier is useless. Di is coarse in muzzle, but is a good terrier. Warren Lady was absent, but her puppies by Brokenhurst Joe were for exhibition; they are promising. Nettle is cheeky and light in bone. Maggie did not deserve the hc. card; she is pear-headed, light in bone and carries her ears badly. Dudley Blossom's color is objectionable, and she is prick-eared. In the class for puppies under 12 months old (dogs), the Clovernook Kennels took first and second with two promising young dogs. Spot did not deserve a vhc. card; he has a nasty, sour head, and carries his ears badly. Blossom, too leggy, was the best of the bitches. Geraldine made a good second. Clover Poppy was absent.

There were five wire-haired fox-terriers entered and the judge commenced by awarding first prize to the worst specimen of the lot. Vero Venture was the lucky one. We would have given him hc. He is leggy, soft of coat and faulty in head. Bundle came next, second prize; she is heavy in ears, wide in front and her mouth is bad. We thought her worth vhc. New Year's Day and Tiny Todger each got a vhc. card. New Year's Day was the best dog in the class. He has a "level jaw" but his teeth are not quite even, and he is light in bone. This dog won the cup at Fylde, England (Fox-terrier Club show), and was second in the open class at London. Tiny Todger was second best in the class. She is a nice little bitch. These classes were badly judged.

IRISH, BEDLINGTON, SKYE, YORKSHIRE AND TOY TERRIERS—(MR. MORTIMER).

The winners in the Irish, Bedlington and Skye classes are all of them well known. The second prize Skye is not so good as the third prize winner, either in head, ears or in tail, and is quite as good in coat; they should have exchanged places. There was not a good Yorkshire in the show. The toys were better, but there was nothing first-class, all of the winners being faulty in head.

PUGS—(MR. MORTIMER).

Bradford Ruby, in very poor condition, should have taken a back seat upon this occasion. Ruby is a grand little dog and can beat every pug we know when he is in condition, but this time he was not in condition, and Max should have taken premier honors, with Punch, who was vhc., second. Puck, third prize, cannot beat Punch. He is not very short in the face, and is smutty in color and heavy in ears. Punch is well known. Bitches were better judged. Miss Kitty and Flossy are well known. They were fully described in our report of the spring show. Cryer's Kitty is long in face, heavy in ears, stands high behind and does not carry her tail very well. She is of nice size and has a fairly good trace. Puppies were badly judged. First was given to Thunder, who is very smutty, heavy in ears and apple-headed. Bessie, placed second, was much the best of the lot; her most apparent faults are in muzzle and trace. Tiny was not worth a vhc. card. She has a very poor head, light-colored ears instead of black ones, no trace—a poor specimen. Judge got a commended card. We did not see him.

TOY SPANIELS—(MR. MORTIMER).

Countess B., hc., is long in face and faulty in forelegs. Prince D. is long in face. Jumbo is very leggy and is not free from white. Pitou, that took first, is faulty in head and is weedy. Nellie, placed second, was away ahead of anything in the class. Pitou cannot beat one side of her. Otto, vhc., has very small eyes.

In the Blenheim class King Victor was much the best in head, ears, eyes, coat and symmetry; his markings are excellent, but he is a couple of pounds too heavy. King Pippin is not so good either in head, coat or markings as Victor. The others were outclassed.

ITALIAN GREYHOUNDS—(MR. MORTIMER).

All of the entries in this class were too large. A good Italian greyhound does not weigh more than 5½ pounds. Dogs weighing 10 or 12 pounds should be entered in the whippet class.

MISCELLANEOUS—(MR. MORTIMER).

Three firsts were given in this class to a Dalmatian, a bobtail sheep dog, and Chesapeake Bay dog. The Dalmatian is faulty in eyes, legs and feet, the sheep dog in coat and head, the Chesapeake dog in head.

ULMERS—(MR. DUDLEY).

This class was very badly judged. First was given to Markoe, who has a very bad head and poor loin; hc. was all he deserved. Spot, placed second, is much too small, and lacks altogether the tiger expression peculiar to the breed. Leo, unnoticed, was about the best dog in the class, and Nell, also unnoticed, is better than the first prize winner.

In the necessarily hurried manner that the list of awards was prepared, some errors were to be expected. A portion of these are owing to the fact that the steward's book did not always correspond with that of the judge. Below will be found a complete list of corrections and additions, which should be compared with the list as published last week.

In rough-coated St. Bernard puppies, Thos. H. Doan's Victoria was very high com. In pointer bitches under 50lbs., Surrey Kennels' Lady Maud was very high com. reserve. In pointer dog puppies A Mears' Point was very high com. In English setter bitches, Fairy III. was 3d instead of 2d. E. I. Martin's Petrel III. and Rancocas Kennels' Coomassie were very high com. In Irish setter bitch puppies the winning bitch was Nellie instead of Nube. In cocker spaniels other than black or liver, E. F. Thomas's Wanda T. (Col. Stubbs—Belle) was 3d. In Clumbers, Tyne was 2d and Bateman 3d. In beagles, a champion class under 12in. was made and won by A. C. Krueger's Bannerman. In beagle bitches over 12in., Flight was 3d instead of 2d. In pug bitches, Mrs. Walter D. Peck's Flossy (A.K.R. 2230) was 2d. In King Charles spaniels, Countess B. was high com. and John Parker's Prince D. (Duke—Queen) was com. In the miscellaneous, Nellie, Bob and Rover were equal 1st. In Irish setter kennels, Lady Clare was in winning kennel. Below is a full list of the awards for the

SPECIAL PRIZES.

Best mastiff, Winlawn Kennels' Rosalind; best English setter dog in open class, E. W. Jester's Glen Rock; best pointer in open classes, W. K. C.'s Lucky Stone; best collie dog owned by member of club, Sans Souci Kennels' Ben Nevis; best fox-terrier in open class, A. Belmont, Jr.'s Regent Vox; best cocker spaniel in open class, W. H. Tuck's Othello; best Newfoundland, J. A. Nickerson's Sam; best deerhound, Clovernook Kennels' Mac; best Irish setter bitch, J. H. Roberts's Jessie; best Irish water spaniel, James Wilson's Dash; best bull terrier, R. H. Dudgeon's Dutch, Jr.; best black and tan terrier, Lizzie E. Tomson's Beauty; best Scotch or Irish terrier, D. O'Shea's Jim; best Skye terrier, W. P. Sauderson's Jim; best Italian greyhound, Annie M. Kramer's Romeo; best bulldog in open class, J. E. Thayer's Remus; best bull bitch in open class, J. E. Thayer's Britomartis; best pug, owned by a lady, Mrs. Walter D. Peck's Bradford Ruby; best dachshund, V. Friehl's Waldine; best Irish setter puppy, R. H. Spalding's Garry; best Irish setter dog, E. W. Clark's Blarney; best beagle owned in Philadelphia, L. H. Twaddell's Millicent; best field spaniel, A. C. Wilmerding's Black Prince; best St. Bernard, J. W. Burgess's First Choice; best fox terrier bred in America in 1884 or 1885, J. E. Thayer's Di; best Bedlington terrier owned in Philadelphia, Fred P. Kirby's Beresford, best English setter bitch in open class, R. C. Cornell's Modesta. The special awarded to the San Souci Kennel for the best kennel of collies was protested, on the ground that but four of the entries were present. The decision of the club had not been rendered up to the time of going to press.

THE IRISH SETTER FIELD TRIALS.

THE field trials which took place last week over the estates of his grace the Duke of Leinster, in the vicinity of Maynooth, seem to have attached to them a greater amount of importance than the number of entries and general surroundings would at first sight appear to justify. They were the first of the kind ever held in the sister isle, and, being entirely confined to a variety of setters of whose working capabilities and behavior behind game much uncertainty existed in many minds; an opportunity was afforded of seeing the famed red setter on "his native heath" or rather pasture, under conditions pretty much the same as prevail in England. As we stated last week, the trials were entirely arranged by the specialist club; the secretary, Mr. J. J. Giltrap, must have worked hard for their formation, and is to be congratulated upon so successful a first meeting. The judges—Col. Cooper, of Kilclooney, co. Tipperary, and Mr. W. Raleigh Trevelyan, of Monkstown, co. Dublin—gave their decisions as thorough sportsmen, and when we did not quite agree with an award there was always a plain reason, and just a one, why it was made in such a manner. The ground work, on both days was, to all appearance, an admirable game country. The fields generally were large, rich in covert, and teeming with fine pastures; the root crops, too, looked as good lying as ever we saw anywhere, and it was deplorable to find such a scarcity of game. The scarcity of course very considerably affected the decisions, and the judges were compelled in many cases to decide upon the merits of the competitors, and the style, pace, and stamina displayed in working, the very first time of finding game.

CONYNGHAM CUP for puppies; winner, the cup and 50 per cent. of entry fees; second, Spratt's Patent Cup and 20 per cent. of entry fees.

First Round.

Mr. R. J. Lloyd-Price's Colleen (Nob—Nelly), 16 mos., *beat* Mr. D. Sullivan's The Marquis (Garryowen—Currer Bell II.), 20 mos.

Mr. H. M. Wilson's Molleen (Garryowen—Nellie), 19 mos., *beat* Dr. Gogarty's Eily (Major General—Nellie), 18 mos.

Mr. L. F. Perrin's Timo (Scamp—Wee Kit), 16 mos., *beat* Dr. Gogarty's Sandy (Major General—Lillie III.), 19 mos.

Mr. W. H. Lipscomb's Dick Bragh (Shaun Bragh—Kate), 10 mos. (a bye), *against* Mr. R. J. Lloyd-Price's Grouse (Grouse—Countess), 17 mos. (absent).

Mr. R. J. Lloyd-Price's Rhiwlas Kate (Rover—Wee Kitty), 17 mos., *beat* Mr. J. J. Giltrap's Sarsfield (Garryowen—Currer Bell II.), 20 mos.

Mr. J. McGoff's Little Nell (Cocksure—Granuaile), 26 mos. (a bye), *against* Mr. E. S. Snow's Jumbo, 16 mos. (absent).

Second Round.

Colleen beat Molleen.
Rhiwlas Kate beat Timo.
Little Nell, a bye.

Third Round.

Little Nell beat Colleen.
Rhiwlas Kate, a bye.

Final Round.

Mr. J. McGoff's Little Nell beat Mr. J. Lloyd-Price's Rhiwlas Kate and won.

ARDILAUN CUP for all ages; winner, the cup and 50 per cent. of entry fees; second, the club's cup (or 5 guineas) and 20 per cent. of entry fees.

First Round.

Mr. H. M. Wilson's Mountaineer (Garryowen—Cora), 4 yrs.

3 mos., *beat* Mr. W. H. Lipscomb's Dick Bragh (Shaun Bragh —Kate), 10 mos.

Mr. R. J. Lloyd-Price's Rhiwlas Kate (Rover—Wee Kitty), 17 mos., *beat* Mr. J. McGoff's Iveragh (Don—Lizzie), 3yrs. 5 mos.

Mr. J. McGoff's Lalla Rookh (Garryowen—Granuaile), 3 yrs. 5 mos., *beat* Mr. W. W. Despard's Gipsie (Carlo—Nellie III.), about 4 yrs.

Mr. J. K. Milner's Frisco (Rattle—Aileen), 7 yrs. 10 mos. (a bye), *against* Mr. J. Hamilton's May (Shot—Loo VII.), 3 yrs. 2 mos. (absent).

Mr. L. F. Perrin's Wee Kate (Attie—Kate), 3 yrs. 1 mo., *beat* Mr. J. J. Giltrap's Sarsfield (Garryowen—Currer Bell II.), 20 mos.

Mr. L. F. Perrin's Timo (Scamp—Wee Kit), 16 mos. (a bye), *against* Dr. Gogarty's Sandy (Major General—Lillie III.), 19 mos. (drawn).

Mr. H. Waterhouse's Chief (Count—Countess), 4 yrs. 5 mos. (a bye), *against* Mr. H. M. Wilson's Nellie (Scamp—Aileen), 5 yrs. 8 mos. (disq.).

Second Round.

Rhiwlas Kate beat Mountaineer.
Lalla Rookh beat Frisco.
Wee Kate, a bye.

Third Round.

Wee Kate beat Rhiwlas Kate.
Lalla Rookh, a bye.

Final Round.

Mr. L. F. Perrin's Wee Kate beat Mr. J. McGoff's Laliah Rookh, and won.

In the final tie for the puppy stake between Mr. Lloyd-Price's Rhiwlas Kate and Mr. McGoff's Little Nell, a very long trial was run during which both animals showed great equality; Nell, perhaps, had the better nose, but was not nearly so well handled as her opponent. To end long and tedious work, the judges ordered the keeper to fire his gun when the workers were in similar positions so far as regards their dogs. The result was in favor of Little Nell, who behaved better to the shot, and of course had the award. Though a somewhat unusual mode of obtaining a result, it was equally as fair to one as the other. An excellent decision was come to in the heat between Rhiwlas Kate and Mr. H. M. Wilson's Mountaineer, this time in favor of the former. After some little preparatory work, mostly in favor of the bitch, Mountaineer drew up for a short distance, made a magnificent point, and was backed. Somewhat uncertain, he moved on, evidently losing the line, and, leaving it altogether, Kate drew slowly in the direction where Mountaineer had previously stood, and likewise pointed. From this good score by the bitch a single bird rose and was killed. Though originally a capital point to the dog, his leaving the line was quite fatal to his chance. In the last trial of the all-aged stake, Wee Kate and Lalla Rookh were not down very long in turnips before the former, in the middle of the field coming down wind, got too near a covey, and dropped instantaneously as they rose, behaving perfectly to the gun. Away to the left and nearer the hedge, Lalla Rookh flushed a single bird, to which she had to be put down, just later another bird rose, which she might have found, and, though steady to shot, she easily lost the tie and stake. Such short trials as the two last and others were a necessity under the circumstances, and if they savor a little of luck in the way of the first to find and behave well being the winner, that as a rule fell to the best dog of the brace down at the time. To make the Irish trials a popular success on another occasion, they must be held where game is more plentiful; and there does not appear any reason why they cannot be held over grouse, which are far more numerous in the neighborhood of Dublin than partridge. On more than one occasion last week we walked for over an hour without coming on birds.

With the working of the Irish setters we were generally pleased. They bore the character of being headstrong, wild rangers, disobedient to whistle and wilful in the extreme. To none of these, not gentle impeachments did we find them more prone, or even as much so, as their cousins of the Laverack, Llewellyn, or any other variety. Most of them were steady in drawing up, few, either puppies or old dogs, chased fur or feather; and the staunchness displayed by some of the former, which we were assured had not been in the hands of their workers more than a fortnight, was extremely creditable—these were Colleen, Little Nell, Eily, and Sandy. What we saw of the Irish setters here proved their good pace, that they quarter their ground well, though not as a rule working it out to the very corners (perhaps more the fault of the workers than the dogs); they do not always appear on the look-out for game, and are decidedly addicted to pottering about on the ground scent where birds have been recently. Persevering they appear to be in the extreme, and only in one instance—that of Dr. Gogarty's Sandy in the trial with Timo —did we notice any inclination to tire, and this only occurred in one field, this dog freshening up wonderfully when he obtained a "sniff of birds" a little later. The most uniform fault of the red setters appeared to be in their natural habit of carrying their heads low. The most notable exceptions to this fault were found in Mr. Giltrap's puppy Sarsfield (who had rather hard lines with Rhiwlas Kate the first round, and with the ultimate winner in the all-aged stakes) and Mr. Perrin's Wee Kate. We fancy that the first-named, a son of Garryowen, was the fastest animal on the field. He could quite run round Kate, he carried his head splendidly, quartering well and covering a lot of ground. With a little more finished breaking, he would certainly make one of the best working Irish setters of the day, and in looks he is quite up to show form. Wee Kate, the winner in the all-aged stake, a daughter of the beautiful Kate of old, is already publicly known as a bench winner. Without the great pace of the puppy already named, she is by no means slow, quarters her ground well, and appears to be always looking for game. The way she carried herself was about perfection, head well up, flag beautifully straight from the back, and she appeared as truly level from the set on of her shoulders to the end of her stern as the top of a billiard table. She possesses a great reputation as a grouse bitch, and showed fair breaking, but there was not sufficient game to well try her staunchness. Perhaps the little suspicion we have with regard to the latter quality might arise from the over anxiety of her owner, Mr. L. F. Perrin, who worked her himself, to prevent her misbehaving. Mr. McGoff's Lalla Rookh, the runner up with Wee Kate, is a bigger bitch, handsome, and we believe, a bench winner, a fairly good goer all round, without the style and head carriage of her more successful opponent. Her breaking was not very finished and possibly she is one of the most head-strong examples of the strain. Little Nell—the winning puppy, a rare goer, with more than moderate carriage of head, better than some, not so good as others—appeared to have a happy knack of finding game. She behaved well throughout, and, with fairly good looks, may be classed as a good bitch, and, without being actually perfect, well able to hold her own in field trial company this side of the channel. Mr. Lipscomb's Dick Bragh is a promising puppy, and performed wonderfully well for a youngster only 10 months old. Probably the biggest animal competing at the meeting he possesses considerable quality and immense bone. A great, strong dog, a little drooping behind the shoulders; with good legs and feet, color and carriage, he would be just the animal to use where there is a tendency in the Irish setter to become small and effeminate, snipy in muzzle, and attenuated in the legs, as is to be noticed in some strains. Mr. H. M. Wilson's champion "bench winner" Nellie we were unable to see gallop more than a few yards, from the cause alluded to last week. Mr. H. Waterhouse's Chief showed to anything but advantage, quite refusing to hunt at all during the early portion of the trial on Thursday evening. Mr. Milner's Frisco has not the pace required in a successful competitor at field trials, but may be a useful dog enough for ordinary sporting purposes, and his rather ungainly gallop is, we are told, the result of a severe accident to one of his hindlegs. Mr. Perrin's Timo is a very handsome dog, fine in color, shoulders, legs, feet, and capital in stern, carried well. Without possessing so much pace as other animals in the stake, he quarters his ground well, proved a fine ranger, and fairly obedient for a puppy. He may reach a higher position in a stake on some other occasion. Mountaineer is apparently a useful sort of a dog to shoot over; his nose is good, though his leaving game in the way he did in his trial with Rhiwlas Kate proved lack of confidence in his own scenting powers; he worked out his ground and quarters well, and was very stylish on point.

From that which we have already written, readers will surmise that the animals competing were by no means deficient in good looks, and this undoubtedly was the case. So uniformly handsome a lot of dogs never before ran at trials; and, with little exception, any present might, without discredit either to themselves or their exhibitors, compete in a show ring. Indeed, about one-third of the animals running had appeared and been successful before what are known as show bench judges. A fact of this kind is so contrary to the ruling that obtains either at the National or Kennel Club Trials, as to be quite remarkable. At the latter, often enough, the ugliest dogs are the best, and those with the least pretension to so-called "show form" prove the winners. An English setter having a record—*i. e.*, a winner both on the bench and in the field—is, indeed a rarety, but here, at the first trial of Irish setters, we have a "best on record" obtained immediatly. In so far the strain common to the Emerald Isle thus possesses a great advantage, and now that it is so presented to the public, the means are forthcoming of popularising the red or red and white dog. The latter, which is said to be almost a distinct variety, had no representative present, if we may except Mr. W. W. Despard's Gipsie; and she, perhaps, had not quite sufficient marking to prove her of the more gaudily-colored strain.—*London Field.*

BAD SHOW MANAGEMENT.

Editor Forest and Stream:

If the canine death returns do not pan out 50 per cent. higher than is usual after a dog show, resulting from the bad arrangements of the Philadelphia Kennel Club's show last week, then many of us will be surprised. The cold-blooded idea of placing valuable dogs—many of them used only to sleeping in snug quarters in one's own house—under cattle sheds, with nothing but a roof to protect them against October's inclement weather, is simply—well, is simply a nail in the coffin of the P. K. C. Then the accommodations for visitors and exhibitors were truly inviting—wading through mud and water half up to one's knees to get from one row of kennels to another was the order of things, not to speak of standing around in it all day for four-sevenths of a week, while the festive winds blew through the corn sheds and our whiskers.

Another little growl and I'm done. I was the unfortunate recipient of a champion medal. It was a fair little medal, worth, say, about three or four dollars; but on being shown Mr. Jones's medal given as a second prize to his puppy in another class, and Mr. Brown's, a third prize, in still another class, my heart sank within me, for on comparing them they were found to be one and the same, save that my hard-earned champion souvenir bore the title "champion" shallowly carved upon its back. EXHIBITOR.

NEW YORK, Oct. 11, 1885.

THE EASTERN FIELD TRIALS.—There is every indication that the coming trials of the Eastern Field Trials Club will be the most interesting that have yet been held. The pointer stake especially promises to prove a hot one and great interest is manifest among fanciers of the breed as to the result. Birds are very plenty and well grown, and with favorable weather the trials will no doubt bring out a large number of interested spectators. At a meeting of the club on the 13th the secretary was instructed to notify the public that all Derby entries for 1886 must be whelped on or after May 1, 1885. It was also voted that the notice to handlers relative to working dogs south of the railroad track of the Piedmont Air Line should be changed to read "that any dog being proved to have been worked south of the Piedmont Air Line Railroad, within seven miles, taking the Bellevue Hotel at High Point as a center, shall be debarred from running and forfeit winnings, if any.

DEATH OF "IDSTONE."—It is with sincere regret that we announce the death of the Rev. Thomas Pearce, better known to our readers as "Idstone." The London *Field* says of him: "In the columns of the *Field* 'Idstone's' writings were highly valued for the crispness of his tales of country life, and for his careful descriptions of the various breeds of sporting dogs, of which he was a first-rate judge. As a companion he was most amusing, his repertoire of tales being as inexhaustible as that of Sidney Smith. Peace to his *manes*. We fear we shall not soon see his like again." He died at Bournemouth, Eng., on Sept. 24, of congestion of the lungs.

DEATH OF CHAMPION RODERICK.—Dr. M. H. Cryer has lost by death his pug dog Roderick. He was whelped July 12, 1878, and was by Mr. T. Morris's Punch and out of his Judy. Roderick was one af the winning litter at Southport, Eng., in 1878, and has won one second, one first, six champion and nine specials in this country. He has left a numerous progeny, many of them having already made their mark upon the show bench.

GREYHOUND LOST.—A black greyhound bitch with the letter S. branded on her side, has strayed or been stolen. A suitable reward will be paid for information that will lead to her recovery by Mr. Johnson, 162 West Eighteenth street, New York.

BOSTON DOG SHOW FOR 1886.—Boston, Mass., Oct. 11.—*Editor Forest and Stream:* The New England Kennel Club claims April 6, 7, 8, 9, 1886, as date for their second annual bench show.—JEAN GROSVENOR, Secretary.

THE NEW JERSEY CLUB FIELD TRIALS.—The New Jersey Kennel and Field Trials Club will hold their first annual field trials on Fisher's Island, commencing Nov. 12. The trials are for members only.

THE NATIONAL FIELD TRIALS.—The entries for the All-Aged Stake of the National Field Trials Club close on Nov. 1. The secretary is B. M. Stephenson, La Grange, Tenn.

BALTIMORE DOG SHOW.—It is rumored that the Baltimore Kennel Club will hold a dog show early next year.

KENNEL MANAGEMENT.

☞ **No Notice Taken of Anonymous Correspondents.**

A. P. F., Oberlin, O.—My spaniel dog seems to be troubled with what I call rheumatism, he was first attacked last winter and was lame in hindquarters for several weeks. He is now having another attack. His hind legs give out as though he had hurt his spine, he will be taken all at once with pain and favor one hind leg, appetite poor as a general thing at present. Since his first attack he sits on one side, never square up and down. At times he seems not to be able to use his hindquarters. Ans. We should say that your dog suffers from muscular rheumatism or lumbago. This is caused by cold. The treatment to be followed consists in rubbing the parts with chloroform linament, perhaps blistering with a fly blister over the affected part. Keep the dog's bowels in good condition and let him sleep in a dry, warm kennel or room.

G. W., Trenton, N. J.—I have an English setter five years old. His hair comes out very badly, and has for a couple of years past. Have tried brushing, combing and washing with sulphur soap. He has been perfectly healthy; had distemper when young and since then hair commenced coming out. Ans. Your dog may have a disease of the hair follicles, but you will probably find, on careful examination, minute scales or dandruff covering the skin. This is scaly eczema, one form of mange, and is chronic. The best skin medicine is Fowler's solution of arsenic, and should be given in graded doses, commencing with three drops, running up to ten by an increase of a drop per diem. After three weeks stop the arsenic for a week and then commence again in same way. For a skin wash get four ounces each of rose and of camphor water, add two teaspoonsful of sulphur and mix all together and apply once daily.

Rifle and Trap Shooting.

Address all communications to the Forest and Stream Publishing Co.

FIXTURES.

Oct. 20.—First Georgia State Fair Tournament, under auspices of the National Gun Association. Judge M. R. Freeman, Manager, Macon, Ga. Beginning Oct. 20.

RANGE AND GALLERY.

THE MASSACHUSETTS RIFLE ASSOCIATION.

BOSTON, Oct. 12.—The three closing days of last week were taken up at Walnut Hill with the matches of the fall meeting of the Massachusetts Rifle Association. Three matches had been provided and for three days the shooting was almost incessant. C. W. Hinman was executive officer of the meeting, with C. E. Berry as statistical head. The programme provided:

200-yard match, Massachusetts decimal targets. Open to all comers; 200 yds. Position, standing. Rifle, any within the rules. Rounds, seven. Entries unlimited. Entry fee, fifty cents. Winners of prizes to be decided by the aggregate of the four best scores; highest possible, 280. The competitor making the highest aggregate score to have first choice, the other prize winners to choose in order of their respective scores. Scores of equal number of points will be considered a tie without regard to rank or value of shots. Ties to be decided by the next highest score made, outside of the four counting scores.

E. F. Richardson 257, C. D. Palmer 250, A. C. White 246, A. C. Adams 243, D. Newton 238, E. J. Cram 237, Geo. Fay 237, E. M. Rockwell 237, R. Reed 236, J. Francis 234, O. M. Jewell 234, J. B. Fellows 233, G. W. Foster 230, J. N. Frye 229, F. A. Whitney 228, B. M. Pitts 216, G. G. Franklin 214, H. K. Richardson 213, W. F. Thomas 212, W. Rust 209, W. Fisher 207, C. L. Holmes 206, E. B. Souther 205, F. W. Yates 205, J. L. Thomas 204, F. D. Bartlett 203, N. F. Tufts 203, A. Law 203, C. A. Joslin 201, L. O. Dennison 199, C. E. Mack 196, J. W. Vining 193, A. C. Simpson 192, H. Withington 191, A. Melvin 190, D. B. Ernst 190, J. P. Bates 188, A. C. Clark 185, G. Bassett 184, H. L. Whitney 179, C. H. Russell 177, A. W. Webb 173, T. Leighton 172, J. R. Munro 169, James Stewart 163, A. D. Alden 162, W. Ford 162, W. C. Johnston, Jr., 161, M. Winthrop 136, H. D. Wilbur 116.

Massachusetts decimal target, at rest, 200yds, rounds 7, position any or rest, any rifle under 10lbs, without telescopic sights, entries same as in Match 1, prizes to be won on the aggregate of each competitor's best four scores, ties will be decided as in Match 1. 75 per cent of total entry fees will be divided into 11 prizes:

J N Frye	69	69	69	70	277	J R Munro	68	68	64	64	264
J Francis	69	69	68	70	276	B G Warren	67	66	66	65	264

S Wilder	69	69	68	68	274	L O Dennison	52	59	54	40	205

600yd. Cartoon Match.—Open to all comers, 600yds, cartoons to count 6, any rifle within the rules, short and mid range sporting rifles allowed any rest, entries unlimited, entry fee 50 cents, four scores to count, ties to be decided by the rules of the M. R. A., Springfield military rifles, as issued by the State, allowed 7 points on each score. All competitors are subject to the rules of the M. R. A. Attention is specially requested to those relating to the weight and trigger-pull of rifles, the loading of guns at the firing point, and penalties for carlessness; no challenge of shots will be permitted except at the discretion of the executive officer; persons challenging will be required to deposit 50 cents, to be forfeited in case the challenge proves unwarranted; sighting shots are not allowed in any of these contests.

Possible 168 on 4 scores, 28 points allowance for military rifle.

S Wilder (long range rifle)	157	B G Warren (mid-range rifle	151
Corp F W Yates (mil)	126+28=154	N Washburn (long range rifle)	141
J N Frye (mid-range rifle)	152	G W Whitcomb (mid-range r)	145
W Ford (mil)	124+28=152	L Wahzer (mil)	105+28=133

EDWARDS.

ALBANY, Oct. 10.—For the past two days the riflemen have been pounding the iron at Rensselaerwyck from early morning until dark in attempting to make good scores. The principal match in the fall meetings and the one which attracts attention outside of the sporting riflemen is the Third Division match. There are about twenty organizations entitled to enter teams for the prize, but the skill of the Tenth Battalion riflemen is known all over the division, and only one of the organizations had the courage to enter the competition against them. The meeting in every way was successfully carried out, over 3,500 shots were fired, and owing to the excellent arrangements no accident happened. Appended are scores of the matches concluded yesterday:

Short-Range Match—200dys.

MANCHESTER, Nov. 9.—The third and last day of the fall meeting of the Manchester Rifle Association was marked by the best of weather conditions and the largest attendance of the meeting took advantage of the favorable elements in an effort to make high scores. The forenoon was particularly one of interest, as some of the best shooting that has ever been seen in the State was developed. W. Dennison was the first to settle down to steady work, and the bulls-eyes rolled from his rifle with but few breaks. He raised himself card after card until half an hour before midday he had made a gain of 18 points and advanced from sixth place to the honorable leadership of the brilliant marksmen who constituted his competitors. Mr. Dennison is calm and deliberate in all his movements and is a model rifleman. His 88 card was the largest made during the three days' shooting. Another gentleman whose brilliant work won admiration was A. C. White, of Worcester, who made an unbroken string of 14 consecutive bullseyes.

The match conditions and winning scores stood; The first match—200yds off-hand, Massachusetts decimal target, open to all comers, position standing, rifle any within the rules, rounds 10, entries unlimited, entry fee 50 cents, winners of prizes to be decided by the

aggregate of three best scores counted as one continuous score, the competitor making the highest aggregate score to have first choice, the other prize winners to chose in order of their respective scores.

W Dennison	83 86 88—257	W Fisher	71 71 70—212
E F Richardson	87 82 85—254	C E Mack	72 69 68—208
C D Palmer	85 83 85—253	F J Drake	71 70 67—208
A C White	83 82 86—251	C A Joslin	62 71 70—203
O M Jewell	83 83 83—249	John Jay	68 66 66—200
A B Dodge	83 82 84—249	W Graham	66 66 65—197
G F Ellsworth	81 81 84—246	J Hodge	64 61 67—192
T C William	75 80 82—237	J B Anthony	58 64 59—181

J B Anthony	22 22 22 21—87		

CREEDMOOR, Oct. 10.—The tenth marksman's badge match of the season was shot to-day. The attendance was very large, but the scores averaged much lower than usual, owing to the attendance of a large number of new men, many of whom had never visited the range before. The winners were:

	200yds.	500yds.	Total.
J F Klein, 17th Separate Company	22	23	45
A F Schermerhorn, 12th Regt	20	24	44
H J Rice, 23d Regt	20	22	42
J R Byrd, 9th Regt	21	20	41
J H Swift, 9th Regt	21	20	41
A L Ely, 7th Regt	17	23	40
G W Lotz, 13th Regt	20	20	40
H D Hamilton, 23d Regt	16	23	39

The next matches will be shot on Saturday, Oct. 24, and on Election Day.

HARTFORD, Conn., Oct 8.—The rifle team of the City Guard, Company F, First Regiment, won the Barbour medal at the rifle tournament of the First Regiment, at Franklin Range, to-day. It was a very agreeable surprise to the team and members of the company, for the team contained five new men who were substituted in place of some of the best shots in the company, who have recently been discharged as their term of service expired. Nevertheless the team did some excellent shooting and made the next to the highest score ever made by a First Regiment company team at a prize shoot. The highest, 535, was made by the City Guard team last year.

The Barbour medal was first competed for by teams from Companies A, D, E, F, H and K of the First regiment and a team from the field and staff, on Saturday, Sept 13, 1879, at the Franklin Range. It was then won by the City Guard team by a score of 441. The Light Guard stood second with a score of 431. In 1880, Company E, of New Britain won the medal and held it for two years, as there was no shoot in 1881, the regiment again took it in 1882 and in 1883 Company K took it from them. Last year the City Guard won the medal by a score of 535, and as above stated they hold it until next year, having won it to-day by a score of 523. The medal has been competed for six times and the City Guard team has been successful four times out of the six.

The following are the scores of the teams which shot yesterday: Company F.—200yds., 257; 500yds., 266; total 523. Company K.—200yds., 247; 500yds., 241; total, 488. Company H.—200yds., 253; 500yds., 216; total, 469. Company B.—200yds., 235; 500yds., 167; total, 405. Field, Staff and N. C. Staff.—200yds., 229; 500yds., 160; total, 389.

THOMASTON, Ct., Sept. 26.—Weekly shoot of the Empire Rifle Club for a badge, 200yds., offhand. Little wind, bright light and just the day for target practice.

Canfield	10 10 11 10 12 11 10 12 10 12—108
Lemmon	10 11 12 11 8 10 12 12 13 8—107
Dunbar	10 8 11 11 12 11 9 12 11 11—106
Thomas	12 10 11 10 9 9 11 12 7 12—103
North	10 8 8 9 8 10 10 9 8 11— 91

Oct. 12.—Only two were at the range; nearly all the remainder of the club were trying their skill with the birds or squirrels. Conditions, windy; very bright light:

Lemmon	11 10 12 10 10 11 12 9 10 12—107
North	10 10 10 8 10 9 9 10 6 10— 92

JAMESTOWN, N. Y., Oct. 9.—Regular medal match, 200yds., offhand, Creedmoor target. Wind light at 8 o'clock; light, bright.

J R Brow	5552355454—46	E H Burns	5444544455—44
A F Ward	5434445554—43	J D Curtiss	3444345444—39
L Hazeltine	5445445444—43	W H Sprague	3445545444—41
J G Sonngren	3451544444—41		

A PROTEST DECIDED.—The directors of the National Rifle Association at their meeting on Tuesday last disallowed the protest against awarding the first prize of $100 to Corporal Yates of the regular army in the President's match shot at Creedmoor. It was alleged that he had shot the first stage of the match with a six-groove Springfield rifle instead of the three-groove.

THE TRAP.

OXFORD, Mass, October 9.—The tournament this week under the auspices of the Oxford Gun Club was very successful. The attendance was good. Among the visitors were, H. W. Webber, E. I. Smith, G. G. Tidsbury, C. B. Holden, W. L. Davis and L. R. Hudson, of Worcester. The only drawback was a very strong wind. The several events and winners were as follows:

First event, 5 clay birds, 9 entries: B. Franklin, first, W. Emerson, M. D. Whittier and R. Waters divide second, A. R. Bowdish, third.

Second event, 5 glass balls, 17 entries: W. W. Webber, Whittier and E. T. Smith divided first; Bowdish and W. R. Dion, second; G. G. Tidsbury and C. H. Parker, third.

Third event, 5 clay-pigeons, 16 entries: Webber and Emerson divide first; Smith and Franklin, second; Whittier, third; Waters and A. Ingraham divide fourth.

Fourth event, 5 glass balls, 16 entries.—Tidsbury first, Smith, Webber and C. B. Holden divide second, Waters third, Franklin and Whittier divide fourth.

Fifth event, 6 clay birds, 15 entries.—W. L. Davis first, G. Jones second, Tidsbury third, Webber fourth.

Sixth event, 7 glass balls, 15 entries.—Bowdish first, L. R. Hudson second, Emerson and Webber divide third, Whittier and Dion divide fourth.

Seventh event, 6 clay birds, 13 entries—Emerson, Smith and Davis divide first, Tidsbury second, Bowdish third, Waters fourth.

Eighth event—6 glass balls, 14 entries. Dean and Bowdish divide first. Hudson, Smith and Webber divide second, Whittier and Waters divide third, Davis fourth.

Ninth event—7 clay-pigeons, 8 entries. Webber first, Bowdish and Tidsbury divide second, Smith third, Whittier and Emerson divide fourth.

Tenth event, 7 glass balls, 9 entries: Dean and Tidsbury divide first; Davis, second; Hudson, third, Bowdish and Franklin divide fourth.

Eleventh event, 9 clay-birds, 12 entries: Tidsbury and Jones divide first; Smith and Franklin divide second; Davis and Emerson divide third; Dion and Bodish divide fourth.

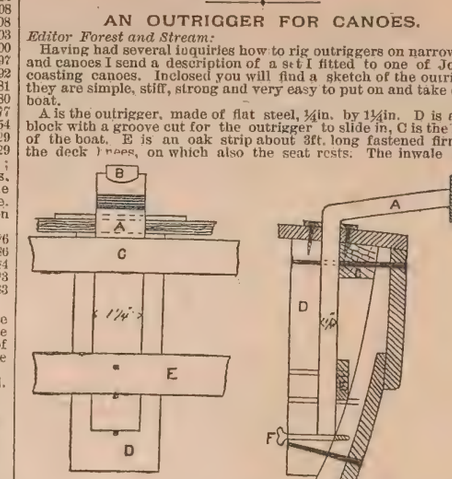
Twelfth event, 9 glass balls, 13 entries: Davis, first; Jones and Smith divide second; Tidsbury, third, Holden fourth.

Thirteenth event, 7 clay-birds, 10 entries—Franklin and Jones divided first, Webber second, Smith and Dixon divided third.

Fourteenth event, 7 glass balls, 14 entries—Franklin and Smith divided first, Jones and Ingraham divided second, Holden third, Dean fourth.

NATIONAL GUN ASSOCIATION TOURNAMENTS.—Special Notice.—Members desirous of organizing tournaments in their vicinity, under the auspices of the Association, are requested to notify the undersigned. All the expenses of the same will be paid by us. Make your arrangements for 1886. We propose to establish a circuit of tournaments annually. Claim your dates now. General office and headquarters, Macon, Ga.—MATT R. FREEMAN, Vice-President and General Manager; F. C. ETHRIDGE, Secretary, Macon, Ga. Send 10 cents for hand book containing rules, constitution, etc. "Fairly started and its future depends entirely upon the manner in which the sportsmen throughout the country respond."—C. M. STARK, April 18, 1885.—*Adv.*

CHICAGO BICYCLE TOURNAMENT.—The Illinois Division of the League of American Wheelmen will hold a tournament at the Base Ball Park, Chicago, Oct. 16 and 17.



Canoeing.

AN OUTRIGGER FOR CANOES.

Editor Forest and Stream:

Having had several inquiries how to rig outriggers on narrow boats and canoes I send a description of a set I fitted to one of Joyner's coasting canoes. Inclosed you will find a sketch of the outriggers; they are simple, stiff, strong and very easy to put on and take off the boat.

A is the outrigger, made of flat steel, ¼in. by 1¼in. D is an oak block with a groove cut for the outrigger to slide in, C is the inwale of the boat. E is an oak strip about 3ft. long fastened firmly to the deck beams, on which also the seat rests. The inwale has a

piece of sheet brass put underneath the outrigger block so it will not wear. On the deck is screwed a brass plate with a slide to stop up the hole when the rigger is not in use. A piece of gas pipe, B, about 1in. long, is brazed into a hole at the end of the outrigger for the row lock to work in, a ¼in. steel rod can be fastened to the deck 1ft. aft of the outrigger to form a brace. I would always advise the use of cast-steel in making outriggers, as it is very much stiffer than iron. F is a screw to hold up the outrigger, so it will not go down further than required; by having several holes for that screw the rigger can be raised or lowered at will.

In putting on the outrigger no part of it ought to be fastened to the skin of the boat, as the continual strain might cause a leak. Canoeing is almost unknown in our city, although we have the mighty Mississippi we might say almost at our door. Now I must give you a description of my canoe. She is built of white cedar ¼in. planking; ribs elm, 2in. apart; Spanish cedar deck, 3-16in. thick; deck beams and knees 6in. apart; the boat is 16×36, 15in. deep at bow, 18½in. at stern; steel centerboard 30in. long, drop rudder and two balance lug sails of 95½ sq. ft. The hull was built by F. Joyner, of Glens Falls, N. Y., Diamond model, with his smooth lap novelty joint. She is a fast and powerful boat, will come about with the mainsail alone; the centerboard is under the forward deck, the forward end being only 2ft. from the bow, the mainmast tube 20in. from bow. The cockpit is 8ft. long, with a hatch at after end; cockpit combing 1in. high.

I read with much pleasure every week the canoeing items in the FOREST AND STREAM and am glad to add my little mite to them.

BURLINGTON, Iowa. JOHN J. OBET.

A SHOOTING TRIP IN THE MUD TURTLE.

AS the shooting was good down the river, four of us, A., H. and myself, with our old dog Bob as No. 4, determined to start for a few days with the ducks. We all packed into our old canoe, the Mud Turtle, and it was a very tight fit; A. being a large man and fond of much baggage, while H. and I are not very moderate in our desires in that way either. The canoe was very low in the water, not a quarter of an inch to spare, and every little ripple that we saw caused us much anxiety, as we feared we should be swamped if a sea got up; but luckily there was hardly a breath of wind and the river was as smooth as a millpond.

Our destination was the R—— Islands, where we hoped to get some duck and woodcock shooting, but not much of the former, as it was very early in the season. When we arrived at the camp ground it was too late to try shooting, so we devoted what remained of daylight to making our camp comfortable, as we meant to stay there several days. We cut rushes for our beds, brought in a good supply of wood, and made things snug generally.

After supper we laid down at the fire to chat and enjoy ourselves, but soon a canoe with two men in it glided up to the landing place. We went down to see who the new comers were, and found that they were T. and C., from M., who we knew slightly. However, it wasn't long before we were chatting away like the oldest of friends. Such is the influence of outdoor life. They camped a few yards distant from us, and when we had helped them to the best of our ability to get things to rights we left them to get a meal in private. We had just laid down again at our fire, when we saw a tremendous blaze at their camp, and on running over found that their tent had caught fire from a spark, and was burning rapidly. T., who had been paralyzed by the extent of the calamity, when he heard us coming regained his presence of mind, and catching up the first vessel which came to hand, and which happened to be their teapot full of tea, threw it on the fire and succeeded in putting it out. They were very doleful at having their tent burnt, their tea gone, and everything in a mess, but when we told them that we had a good supply of provisions, and could no doubt give them something to eat, they cheered up wonderfully and came over to our camp. We sat until late in front of the fire spinning yarns. It was not a very wise thing to do, as we meant to shoot next day, but we became so interested in discussing our plans that we forgot how time flew. T. and C. told us that they were expecting two old shooting chums of ours down that night, or to speak more correctly, morning, and wondered why they didn't turn up.

At last, tired of waiting we turned in, agreeing that the first man to wake should arouse the rest. After sleeping a couple of hours I woke, and, on looking at my watch, found it was time to be stirring, so got up. Not so A. and H., who would not leave their warm blankets for the cold, foggy morning outside; so getting into my clothes, I took my gun, and calling the dog, walked over to the other camp. I saw a canoe hauled up on the shore, covered with a rubber sheet, which I pulled aside and discovered our friends sound asleep, they having arrived after we had turned in. They said they had not left M. till late in the evening, and, as they were very tired, fell asleep in the canoe after paddling ten or twelve miles. The canoe, left to itself, drifted down the river, with the bow pointing up stream. When they woke they thought they had only been asleep a few moments, and set to work again paddling up stream, the night being so dark that they could not discover their mistake. After going several miles J. thought something was wrong, and on going ashore discovered their error. Hence their late arrival. In spite of their hard night's work they were ready to come out shooting, T. making the fourth, C. being too lazy to come.

On arriving at the first marsh we divided, T. taking the right hand side, I taking the left, J. walking some distance behind me, and B. staying at the end to get any that might turn back. We put the three spaniels, one clumber and two cockers, into the reeds to put the birds up. We had only gone a few steps when a duck got up on T.'s side, who bagged him handsomely, his dog retrieving in fine style. We had hardly started again when another got up, which T. also knocked over. The next bird also rose on his side, but somehow he missed him clean with both barrels. G. also cut loose at it, but he also scored a miss.

As he passed me at very long range, I fired and dropped him. Old Bob now put one upon my side, and, letting him get well away, I fired and bagged him. T. now got another opportunity, which he improved on and bagged another. After this our luck seemed to desert us, and we worked for a couple of hours, not seeing a feather. At last Bob put up another for me, which was also brought to bag. In making a short cut between two points I got "bogged," and only with the greatest difficulty succeeded in extricating myself, my long wading boots hindering me greatly. J.'s luck now turned, he getting a couple of shots at ducks, both of which he knocked over.

The others were now getting tired, so went back to camp, leaving me alone. I was not satisfied yet, so went back to the first marsh we had tried, hoping to get a bird or two which had evaded us before. Old Bob got on a scent at once and tracked a woodduck on to the shore, from which he soon put it up. He also was brought to bag. The heat was now intense, so I went back to camp, A. and H. being glad to hear that we had had some sport, and sorry they had not come with us. Although the ducks are very scarce here at this time of the year, it is very good sport shooting them, as they get up from the reeds like snipe before the spaniels, giving very pretty shots. As we had not expected to find many ducks, we had only brought two or three rounds of heavy cartridges each, and these we had used, so we had to give up trying for ducks.

After breakfast C. took T.'s gun and went off by himself. Half an hour afterward we heard a shot fired as we thought by him. I must here explain that C. is not used to the woods or to a gun. An hour after hour passed and C. did not put in an appearance, we became very anxious, and pictured him weltering in his blood, having shot himself by accident, etc., etc. At last we could bear it no longer, and all went out to search the woods for him. We looked for an hour or more, and at last got tired and went back to camp to rest before setting out again. Who should we find on our return but C. sound asleep. We woke him up and made him tell us what had happened to him. It seems he had gone from the island we were on to another much larger one, and had lost himself on it, and had wandered about until, by a lucky chance he had got on to the trail that he had made going in, and following it back managed to find the camp

At noon J., B., T. and C. left, they having to attend a pigeon match down the river next morning, and we were left alone again. The weather now was very hot, and anything but lying in the shade and dozing was almost an impossibility. My appetite, however, never deserts me, so I made a savory mess of bacon, onions and potatoes. When I asked A. if he wanted some dinner he came over to see what was going; but when he saw the bacon he gave a piteous moan and rushed back to his seat, saying: "Well, I've a pretty good appetite generally, but I'll be shot if I can go fat pork when it's 110 in the shade." So, as I didn't like to see good food wasted, I ate his share.

In the morning I tried for woodcock and bagged a couple, the others being too done up with the heat to come. We turned in early and slept well. It was too hot next morning to go out shooting, so we did not get up till late.

At midday we started out on our long and hot paddle home. It was very rough on the main river and we found it very dangerous in our heavily laden canoe, so decided to land A. and the dog and they were to walk to T—— and catch the night boat for home, while H. and I took the canoe on, as she would be able to ride out the rough weather, now that she was lightened. We sailed all the rest of the way, so got on very fast, reaching home in good time. F. M.

OTTAWA, Canada.

SMALL YACHTS VS. CANOES.

WE have received the following letter from "Guenn" in answer to Mr. Clapham's challenge. The original challenge issued by "Guenn" was to be a very different boat, and it would be interesting to learn how big a boat Mr. Clapham proposes to substitute for "Deja's" 14x2 cutter canoe. The Guenn is 15ft. on deck, 31½in. beam, 14in. depth of hold and 6¾in. draft, with 140sq. ft. of sail and folding centerboard:

Editor Forest and Stream:

Mr. Thomas Clapham, of Roslyn, L. I., boat and sharpie builder, seems to have a perpetual mortgage on your reading columns, to judge by the amount of free advertising he obtains for his specialty in the shape of letters to the editor. What relation my challenge to "Deja" as a canoeist, disputing the extravagant claims made for his paragon at the expense of all present canoes, bears to the superiority of the sharpie over everything that floats, as claimed by him, I fail to see.

But as I enjoy a good race beyond most things, I will accept his challenge, the race to come off from the Seawanhaka Y. C. house some day this month, the FOREST AND STREAM editor to judge and lay out a course; distance and time limit as before named, viz., about 5 miles either to leeward or triangular and return, and two hours to make the race in. The A. C. A. International cup fond to be the beneficiary from the pocket of the loser. The race to be singlehanded, no ballast to be shifted. FOREST AND STREAM has my address.

GUENN.

Editor Forest and Stream:

When "Deja" first made his attack on the canoe in the FOREST AND STREAM he professed to voice the views of a thousand or more disgusted canoeists. Now that "Dot's" one or two thousand have come out in sufficient numbers to keep "Deja" in races for some time, we would like to hear from "Deja's" constituents. ROB ROY.

Editor Forest and Stream:

"Seneca" seems to think that the conclusions arrived at from my limited observation of the sailing qualities of the sneakbox are incorrect. Now, if "Seneca" is prepared to state that a canoe will not outpoint and outfoot the box to windward, and also beat her free, I shall be obliged to believe him, for I was never in a box in my life, and my canoeing experience does not extend over one-quarter the length of his; but I have seen three sneakboxes badly beaten by sailing canoes, and have never seen a canoe with the slightest pretension to speed beaten by a box. So my statement was not entirely baseless. "Seneca" says a box will carry twice the sail a canoe will. Unquestionably she will; but on the 31st of last July, upon Eel Bay, I saw the Nirvana, a 14ft.×27½in. canoe, with about 65ft. of sail, absolutely run away from the "Brooklyn yacht" with 115ft. So I should say that she needs considerably more than twice as much to keep up with the procession.

I have not written the above with the idea of convincing any one that the canoe is superior to the box, because I consider their qualities do not permit them to become rivals at all. They belong to utterly different spheres. I am much indebted to "Seneca" for his invitation, and, should the chance offer, shall certainly avail myself of it; but why does he talk of an introduction? It is less than a year since I had two or three letters from him direct, though since he left Washington I have never heard where he has taken up his abode. If it were not that he speaks of my nearness to him, I should suppose he did not recognize me under my present signature. I shall consider myself most highly favored by a chance to cruise with such an old hand, and shall gladly welcome any communication from him. KATRINA.

PITTSBURGH, Oct. 9.

A PURITAN KEEL BOAT.

FIFTEEN years ago there was a fleet of small keel sailboats in Plymouth harbor, used largely by the lobstermen. I have no doubt the same boat is still in use there, but cannot say for certain, as it is several years since I last visited the rock on which the Pilgrims landed. These boats are from 15ft. to 20ft. long with a beam from 4 to 6ft. They draw about 1ft. of water forward and 2ft to 30in. aft. The keel proper is 3 or 4in. deep forward, running to a foot or more at the sternpost. The boats have an overhang of about 2ft. at the stern, a raking sternpost and plumb stern. The ballast is usually iron, placed as low as possible inside. The cockpit is about 8ft. long, elliptical in form, and has a high coaming all round it. Some of the boats are fitted with a hatch or movable deck, which is used in rough weather, over the forward part of the cockpit. This hatch fits down over the coaming and has considerable arch to it, and when in position only leaves about 4ft. of open cockpit for helmsman and crew or passengers. The mainmast, which is forward, is stepped very near the bow and carries a large sprit sail, or a regular fore-and-aft gaff sail peaked up very high. This sail has no boom, as the lower end of the leach runs aft of the mizzenmast, but has two sheets at the clew, one on either side of the mizzenmast. The mizzen is about one-third the size of the mainsail, and in heavy weather is not used. The mast steps through a fixed seat in the middle of the cockpit, running athwart ship. The sail is generally laced to the mast. The mast is lifted bodily out to lower sail, and stowed below. The mizzen has a boom. The entire rig looks very much like that of the modern canoe with lug sails, the placing and proportion of sails being exactly similar. A flush deck extends the entire length of the boat, being 8 or 10in. wide amidship outside of coaming, and has considerable cambre. The boat has a good sheer and high bow.

This is the boat I learned to sail in, and if "Deja" thinks I don't know anything about keel boats and sailing, I have only to refer him to Capt. Watson, of Plymouth, if he is still alive, who built the Grecian Bend, and of whom I chartered her for a season when at school. If the Captain don't report that "Knapp's boys" got the most work out of that boat in the shortest time during that summer, I am much mistaken. In 1871 four of us took a cruise from Plymouth in a similar boat—the Black Ball, belonging to Mr. Robbins—to Wellfleet and back, around the shore of Cape Cod Bay. We took our time going, five days, entering every harbor and inlet, and visiting all the points of interest on the north side of the Cape. Returning we made the run, following the shore all the way, in a day and a night.

The boat sails very close to the wind, as the mainsail can be sheeted in wonderfully flat; and before the wind there is not the pull on the rudder that there is with the catboat. The luck of the boom on the mainsail, however, necessitates close watching when running free to prevent a premature jibe.

The tide has a mean rise and fall of over ten feet at Plymouth. At low tide the harbor is a mixture of vast mud and sand flats with deep winding channels between. We fellows knew all the channels in Plymouth harbor proper, where we generally sailed, but over Duxbury way the location of channels was unknown to us. Eight of us sailed over to Duxbury one afternoon and were prevented from returning the same day by a gale of wind. Starting back at daylight next morning we intended to get home to breakfast and in time for school. The tide was just beginning to ebb, when in the very middle of the bay one of the four boats grounded, and in a few minutes the tide had left her hard and fast. Before the others could get to a channel a like fate befell them. In two hours we found ourselves on an island perhaps a mile long and more than half a mile wide, and worst of all, a deep channel between us and shore. We had brought with us only enough provisions for a supper, and that supper had been eaten the night before. We had no water fit to drink. At low water one of the fellows swam ashore and got a couple of bottles of fresh water for the rest. Between two and three in the afternoon we floated off, and got home an hour later, sadly demoralized.

Friend "Deja," what would you have done had you been of the party in your perfect ship? Now don't be too hard on us, for we were only school boys you know. And yet, though that is fifteen years ago, I don't believe I have yet learned enough to avoid such an accident in a shoal harbor which I am not familiar with, if I sail into it with a keel boat. Had "Seneca" been with us he undoubtedly would have attended school that day. Much as I enjoyed a holiday in those times, there was not a minute of our stay on that flat I did not wish myself comfortably seated at my desk in the school room, a good breakfast and dinner inside of me in place of those clams that I dug and ate, and which gave me a jolly colic. "Deja," picture to yourself a boy with a colic, from eating raw clams and preserved ginger (left over from supper) on a mud flat in the hot sun, with not a drop of good drinking water anywhere within reach, and without a place to lie down. You know what position a keel boat takes when left by a tide on a flat. I believe in a keel—in its place. DOT.

P. S.—Have you heard from that army of canoeists you alluded to as only awaiting a prophet to lead them to the perfect ship—ever ready to throw aside paddle and canoe sails—now that you have pointed your index finger to the path? FOREST AND STREAM, though eager to publish even a line from any of them, I notice has been silent as the Sphinx—except for your second little gasp when you discovered the exact spot you had planted your aristocratic heel upon. D.

THE TRAMP-GUENN MATCHES.—Three matches have lately been sailed between the Guenn, Brooklyn C. C, and Tramp, N. Y. C. C., the former sailed by Mr. C. V. R. Schuyler, Brooklyn C. C, while the Guenn's owner, Mr. Whitlock, sailed the Tramp. The first race was sailed over the course from the N. Y. C. C. house around Buoy 17, in a good S. E. breeze, Guenn carrying two-reefed mainsail and short mast, and Tramp a new storm trysail, a loose-footed standing lug of 46ft. only. Tramp won easily, Guenn not turning the buoy. A second race was sailed immediately after over the same course. A very severe squall struck the boats on their return, just after Guenn had shaken out a reef. Tramp carried her sail through it safely and won easily. The third race, sailed a week later, was from the old Seawanhaka Basin around Buoy 18 and Fort Lafayette. The wind was light and the water smooth, both carrying full sail. Tramp led over the whole course, winning by over one minute. These results must in a great measure be attributed to the fact that the Tramp was much better handled than her opponent.

OBITUARY.—All who have visited Camp Griedstone for the last two years will regret to hear of the death of Mrs E. J. Toker, who did so much to make Squaw Point the pleasant place that it has been for two seasons. Mr. and Mrs. Toker with their party were the first to welcome the coming canoeists, and the last to leave when camp was over; and their friends, who number the entire camp, were always welcome at the Peterboro tent. To those who have shared their hospitality the return next year will be in sad contrast to the past season's merry reunion, without the pleasant welcome of the "Chaperone." Though we canoeists knew her for but a short time each season, her kind heart and bright disposition won the regard of all, and we can heartly sympathize with those whose loss is still greater, as they knew still more the many beauties of her character.

AN INTERESTING SOUVENIR.—The Merrimack meet of 1885 has been immortalized (as was also its predecessor) by a book of sketches done in India ink, by Joseph Smith, and now going the rounds of the Vesper boys and their friends. The funny side of the camp is graphically illustrated, one page showing how a couple of the boys "tossed" a guest, who, the text informs us, was "not de-Neidé customary civilities of the camp" Numerous photographs, taken on the ground, accompany the pen and ink sketches, and the whole combine to form an interesting souvenir of the meet, which the artist-author sends out "with a dim notion that it may some time be returned" to him.

SHATTEMUC C. C.—The fall regatta of this club was held on Saturday, six races being sailed. The Class 2 paddling was won by W. M. Carpenter, Class 4 paddling by H. M. Carpenter, Tandem race by Messrs. Carpenter, Class A sailing by J. K. Hand, Class B sailing by T. J. Hand, and the upset race by J. K. Hand. The full account will appear next week.

HARTFORD C. C.—The account of this club's fall races on Saturday was received too late for this issue. There were ten races on the programme. The open sailing race without limit was won by John Bowles, canoe Gluck, Springfield C. C. The challenge cup race was postponed for lack of wind.

SPRINGFIELD C. C.—This club will hold their regatta on Oct. 17 at 2 P. M. There will be a tandem paddling, tandem sailing, single paddling, sailing with and without ballast, hand paddling and sailing without rudders. The races are open to all.

A TWO MONTHS' CRUISE ALONG THE SOUND.—Several young canoeists from Hartford spent the months of July and August cruising and camping along Long Island Sound, between New London and New Haven. A log of the cruise was kept by them.

Yachting.

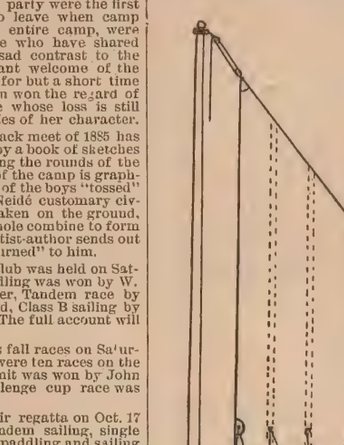
A CHALLENGE FROM GALATEA.

THAT the friends of the narrow cutters are by no means discouraged at the result of the late races, and that they are not yet ready to split their boats open and shove their narrow sides apart or to hip them, like the Sappho and the latest specimen of our local skill, the Speranza, is shown by the challenge just sent by Mr. J. Beavor-Webb on behalf of Galatea. It is generally known that this yacht was to come out here this fall and race after Genesta if the latter failed to win the Cup; but from first to last she has met with nothing but ill luck; her skipper, in spite of his reputation, has proved a complete failure, and the final loss of her mast put an end to all ideas of an Atlantic passage. Apart from her accidents, she has not been successful as a prize winner in her first season; but her designer, in whose hands the matter of challenging was left, has decided to bring her out here after a pretty thorough knowledge of the boats she will have to meet and the weather she is apt to sail in. Evidently he does not ascribe Genesta's defeat to her narrow beam, as the new boat is five feet longer, with the same beam as Genesta. In construction she is of steel throughout, which has hindered her thus far from the scaling of the bottom that always occurs in a first season; but by next year this will be remedied.

No doubt Mr. Webb's experience here will suggest many points in which Galatea may be made to do better than Genesta has this season; the courses, the climate, the prevailing winds, the entire conditions of racing are different from those that Genesta's crew had been accustomed to at home, and no doubt Galatea will be a more formidable adversary than Genesta. That any radical changes will be made in her as the result of Mr. Webb's observations here is not probable, though he has decided to try her with a laced mainsail and test it thoroughly with the loose-footed one. It is not surprising that a party of non-technical reporters should have circulated as a fact the yarn about a centerboard in Galatea, but it seems that some who should know better have most unsuspiciously swallowed entire the tub that amiable Captain Carter threw to the voracious and omnivorous whale that was constantly cruising about Genesta on the lookout for interviews and information. We can give them also another interesting piece of news which they can digest at their leisure, and the truth of which we can vouch for. Unlike Genesta, Marjorie, Tara, Marguerite and Irex, Galatea will have no outside ballast, but it will all be stowed inside the hull.

THE ACCOMMODATIONS OF A 20-TONNER.

CLARA, the latest addition to our cutter fleet, promises to give an account of herself, as far as speed is concerned, and will no doubt score a big record next season. If she and her class are fast, the next question, as their safety is now universally acknowledged, is that of accommodation. The following plan shows the arrangement of Lenore, Clara's most successful rival abroad. She was also built by Fife in 1882 and is 60ft. over all, 53ft. waterline, 9ft. 4in. beam, 6ft. 2in. in depth, and draws 10ft. with all lead ballast. Her general arrangement below is shown in the accompanying plan. The forecastle is quite roomy with plenty of head room, the forward cabin contains



one berth and opposite to it is a passageway and the pantry. The saloon is 6ft. 8in. high, with two large sofas with sideboards and lockers at head and foot. The companion leads into a separate entryway, with w. c. and storeroom opening into it, while at its after end is a door to the main or ladies' cabin. This is a good sized room with four regular berths, sofas and washstand. The counter is used for sails. Though a fast racer Lenore is also a good cruising boat, having berths for five besides the crew without using the cabin as a sleeping room. The arrangement is excellent, securing an easy access to all parts.

A REEFING GEAR FOR JIBS.

Editor Forest and Stream:

While looking over the back numbers of the FOREST AND STREAM I find a new arrangement for reefing jibs. I send a sketch of one which, where a man cannot go out on a bowsprit, I think this is the simplest and best methd of reefing. All there is to be done is to drop the jib

partly, take hold of line marked A, and pull inboard until jib fits snugly on jibboom, then make fast to a cleat on the end of jibboom. The whole thing consists of a rope running through screw eyes on jibboom and through the sail, crossing on both sides.

NEW YORK. ROBERT TATE.

REPAIRS AND ALTERATIONS.

AT THE end of the season, when the time comes for laying up, there are always some changes, repairs, or other improvements that have suggested themselves after several months' sailing, and which must be done before spring. As the time is seemingly long in which to complete such work it is usually neglected at first until in midwinter something calls attention to it, by which time many things have been forgotten; and when the work if finally taken in hand it is usually well toward spring, builders are busy, and as a result fitting out is retarded and the work is improperly done. The proper time to begin all such work is when the yacht is first stripped. As sails are unbent and gear stored the owner should go over all parts, making a full list of everything to be done to hull, sails, rigging and entire outfit. If this is done at once all will be included, but if left until winter, when most of the stuff is stored out of sight, many little points will be overlooked. In case any extensive alterations are needed the first thing to do is to study carefully the existing boat and its faults, and then to plan carefully and intelligently how to improve it. Whether or no any changes are to be made, every owner should know his boat thoroughly, and now, when the weather is still fine, but no sailing can be done, is the time for such work. With the yacht hauled up high and dry and all ballast removed as it will be, every part is open to examination; and the yachtsman will find a large and interesting field for study inside and outside of his boat. Measurements of all parts should be taken, including sails and spars, as they are often useful for reference, and cannot be obtained when afloat. No better method of studying the yacht can be found than to take off her lines, which, with her sail plan, can be neatly plotted and preserved. There are many good sailors who do not know how this is done, but to them, and to all who contemplate any changes in their yachts, we can recommend "Small Yachts," published by the FOREST AND STREAM, as a reliable guide in this and similar work. By its aid the process of "taking off" the lines may be readily understood, while the instructions in the simple drawing necessary are equally clear.

When once the boat and its defects have been carefully studied the question is how to remedy them, and here again "Small Yachts" comes in with examples of all classes of boats and rigs, and its clear exposition of principles; a study of which in the long evenings of the fall and winter will not fail to set any yachtsman to thinking carefully and to obtain a better knowledge of his boat than he ever had before. When once the main alterations have been decided on, shortly after laying up, there is still plenty of time for a thorough maturing of plans; but remember that the sooner work is actually commenced the better. Builders are less busy in October, November and December than at any other period of the year, and not only can work be done to better advantage before the snows and extreme cold of winter, but better terms may usually be made during this dull season, both for repairs and new building.

When once the necessary work is decided on and general plans and specifications drawn up, then is the time to call in the builder to consult with him as to prices and the cheapest and best methods, after which the full plans and specifications may be prepared and work commenced at once, to be carried through promptly and regularly until it is fully completed in good season.

In the case of a large yacht or of extensive or costly alterations the services of an expert will be necessary, and if he be competent he can save the owner more than his fee; but in the majority of cases with the smaller yachts the owner, perhaps assisted by some friend in the club who has made a study of design and construction as an amateur, will be competent to do all the work and will find a pleasant diversion in the careful study of his beloved craft. In any case the main points are to study carefully the defects and their remedies well in advance, to plan thoroughly all alterations and to decide exactly what is to be done, before beginning the actual work on the boat. It is much easier and cheaper to erase pencil lines than to tear down or build up in wood and iron, and a little labor and thought over the drawing board may save many dollars when work is once begun. Decide on every detail, draw or describe definitely every part, begin the work in good season, placing it in good hands; and when it is completed it will be better, it will cost less and will be more satisfactory, not only to the owner, but to any honest builder whom he may employ than if done at the last moment in the usual haphazard way.

KNICKERBOCKER Y. C. FALL REGATTA.

THE Knickerbockers have been as unfortunate this year as they were last, in the matter of wind, as their race on Sept. 30 was sailed in such light weather that the first yacht home only arrived 11 seconds inside the time limit of 6 hours, as timed by the regatta committee. Others who took the times of start and finish on their own watches declare that the elapsed time exceeded the limit by 7 minutes and protested against the official time as incorrect, and it is not yet decided whether the race will stand or will be ordered resailed. This regatta is the great event about the west end of the Sound, and this year the club ventured on a larger scale than usual by hiring the iron steamer Cygnus, a larger and finer boat than they have ever before had, but the result justified them, as the trip was a success financially and also as far as the guests and friends of the club were concerned.

The yachts were divided into nine classes, including one for steam yachts, the sailing craft, keel and centerboard, ranging from 45ft. to 14ft. corrected length. All but the eighth class sailed a 20-mile course around the Gangway buoy, that only turned the Fort Schuyler buoy, 12 miles. The allowance was 2m. per foot sailing length (length and sail area).

The wind was very light from S. E. at 11:13, when the yachts were started, all carrying kites. There not being wind enough to maneuver in the strong tide, the start was a slow one, and it was 11:28 when the last of the 39 starters was clear of the line. After the start the breeze died out completely, leaving the yachts to drift slowly for several hours, until about 3 P. M. there came a light south wind, before which the yachts made the outer mark, turning as follows:

Lizzie R.	3 40 42	Narrioch	3 58 15
Adele	3 41 55	Undine	4 01 34
Rosetta A.	3 42 02	Hurry	4 01 36
Homer	3 46 55	Wacondah	4 01 45
Dandy	3 47 17	Torino	4 04 46
Annie E.	3 49 12	Flash	4 06 30
Surf	3 49 32	Black Hawk	4 06 45
Bon Ton	3 49 37	Peerless	4 08 10
Maggie	3 52 54	Culprit Fay	4 08 15
Sara	3 52 55	George Scott	4 09 18
Kitty B.	3 54 30	Gil Blas	4 10 46
Truant	3 55 15	Weary Wish	4 15 32
Swan	3 56 20	Whim	4 18 55
Lena	3 57 45		

Coming home the work was very slow in the light wind, but the cutter Surf managed to repeat her performance of last year, walking away in the light air, coming second to the fastest of the light-draft centerboards, the Lizzie R., and ahead of all the others, beating her own class badly. As stated above the actual time of the Lizzie R. was given by the committee as 5:59:49, but it is not yet settled whether this time is correct. If the race stands, Lizzie R wins a second leg for the A. W. Mott cup, Gracie having one leg. She also takes the silk pennant and the class prize, the winners in the other classes being Surf, Lena, Rosetta A, Dandy, Hornet, Bon Ton, Vaddie and Seiba. The full times were:

	Start.	Finish.	Actual.	Corrected.
Surf	11 23 50	5 48 40	6 25 10	6 12 37½
Annie E	11 22 16	5 42 39	6 20 14	6 20 14
Sara	11 22 53	6 14 10	6 51 17	6 30 27
Undine	11 23 30	6 25 40	7 02 10	6 42 30
Hurry	11 23 16	6 34 35	7 11 19	6 50 16½
Wacondah	11 20 43	6 30 02	7 05 19	6 51 27
CLASS NO. 2—CABIN SLOOPS UNDER 31 FEET.				
Lena	11 23 30	6 28 40	7 05 10	7 05 10
CLASS NO. 3—OPEN JIB AND MAINSAIL YACHTS, 25 FEET AND OVER.				
Lizzie R.	11 15 11	5 15 00	5 59 49	5 59 49
CLASS NO. 4—OPEN JIB AND MAINSAIL YACHTS, 21 TO 25 FEET.				
Rosetta A.	11 15 54	5 31 31	6 15 27	6 15 27
Adele	11 16 15	5 32 49	6 16 34	6 16 34
CLASS 5—OPEN JIB AND MAINSAIL YACHTS UNDER 21 FEET.				
Dandy	11 16 22	5 56 55	6 40 33	6 39 50½
Maggie	11 16 22	6 07 57	6 51 35	6 46 20
CLASS NO. 6—CAT-RIGGED YACHTS, 21 TO 25 FEET.				
Hornet	11 10 49	5 54 25	6 43 45	6 40 35
CLASS NO. 7—CAT-RIGGED YACHTS, 17 TO 21 FEET.				
Bon Ton	11 09 40	6 11 30	7 01 50	6 59 37½
Narrioch	11 10 07	6 23 20	7 13 15	7 11 22½
CLASS NO. 8—YACHTS UNDER 17 FEET.				
Vaddie	11 11 27	4 48 00	4 56 33	4 56 33
Sairey Gamp	11 11 25	4 47 00	5 35 35	5 34 53
Centennial	11 13 00	4 17 15	5 04 15	5 01 18
STEAM YACHTS.				
Seiba	11 20 56	2 44 00	2 23 04	2 23 04
Mystic	11 20 45	2 04 10	2 43 25	2 43 25

The other yachts were not timed at the finish.

WHOSE WATERLOO?

IN gratification of a desire evinced from many quarters, the undersigned once more takes up a theme to round off for a full due his labors in behalf of a wholesome class of vessels, hitherto abused and misrepresented by pens incompetent to argue for or against the issues of the time-worn contest between cutter and sloop.

From letters and utterances in certain quarters, a belief seems to be current that in the international races the battle has gone against the cutter with great odds in favor of a so-called sloop, and that in consequence the "cutter men" have not been heard in the land as loud as before. A more thorough misapprehension could not well exist. It is perhaps just as well that an extended and most enjoyable cruise in a smart little 7-tonner, in which, by the way, I helped to pull off a big win against a field of eleven sloops, has delayed the appearance of this review. The public has had time to cool down and more calmly consider the actual state of affairs, with vision no longer upset by the splurge of bunkum and the "high falutin" literature ground out by the cargo in the lay prints. Freed from the gushing rubbish of the daily press served up red hot to suit a flashy taste for literary intoxicants of a fiery order, the yachting public will now turn an ear to a statement of facts, and to inexorable logic, all the better prepared to abide by the verdict of an inquest upon history, in favor or against an orthodox faith.

Without any attempt in justification of what I may term "my side of the case," without anything at all in explanation of the international matches, without even a reconsideration, but through force of the commonest kind of logic, the very teachings of the races upon the face of matters, the portion of the public which is capable of an expert opinion has long ago come to very precise conclusions. These are identical with the summary here undertaken. Let me premise by assuring the faint-hearted and the doubting Thomases that the Genesta—Puritan matches from first to last have given rise to the utmost satisfaction, even to gratification among the sailor element in the yachting world, those laying claim to the cognomen "cutter men" in contradistinction to the mere civilian afloat in pursuit of an "excursion." For, tersely put, capable critics, seeking no balm to national vanity, but proselyting only for the sake of popularizing the best boat, are one and all in accord in the estimate they place upon the results of the two trials between Puritan and Genesta. They evince no hesitation in affirming and in proving that the America Cup remains in this country through luck, undeniable good fortune, plain and clear as day, and subject to neither question nor dispute.

Luck and nothing but the most palpable luck has saved us from national defeat. I put it just this way, since not for an instant can it be conceded that the sloop herself has been rescued from annihilation. The doom of the sloop had been once for all settled, when the Boston hybrid was nominated and Priscilla sent into hiding to be tinkered and shoved up one rank into the family of modern ideas by next season. No matter in what light we view the contests, it is impossible to draw the faintest consolation for the typical American sloop, as she has been known to us for half a century, and as she was championed up to the hour which heralded Puritan ahead in the trials of the home fleet preparatory to meeting the giant from far waters. The sloop, the good, old-time American sloop, in all her pristine glory of flat floor, light weight, inside ballast, and mast in the eyes, with the one hundred and one minor lubberly attributes, upon which the old school once set so much store, this contrivance, this mere toy and nursery imitation of what a yacht ought to be, she never figured in the international races at all. She was out of the hunt, shelved as a curio in remembrance of a past, fast dimming in the light of modern achievements in yacht arch tecture. With her, with the American sloop, the world has no longer any concern. She is a wilted flower, a relic of a barbarous yachting past, and never will she be resuscitated.

Neither the American landsman nor the American trap shared in the great battles of September. They were both, thank fortune, conspicuous by their absence. Neither have they figured in subsequent events, when Genesta, for lack of fit opponents, was cock of the walk from Maine to Key West, toyed with the crowd at her pleasure, landed our cherished and high-priced silver emblems of superiority at sea and set sail for home, to all intents and purposes an unconquered vessel, except where fickle Dame Fortune had frowned on the grand cutter and favored a go-between and cross-breed for the nonce to inflate a few giddy heads with false confidence in the future. In

one race only, in the triangular match outside for the Vice-Commodore's Cup, offered to single-stickers, did the bold and wholesome cutter catch the old style American sloop as an entry, and then she gave that sloop a drubbing which will never be forgotten, for the Genesta wiped out the sloop Gracie far more effectively than ever Puritan accomplished.

And what Genesta did with the big ones, Clara, famous little Clara, fresh from her splendid cross-seas record, demonstrated in her own lot of small sloops at and about 50ft. waterline length. Clara, the narrowest of the narrow, the most "cuttery" of the cutters afloat, after rather a poor get-away, ran and winded on Athlon, Daphne and beamy Isis hand over fist, and won as she liked from a field at least as good in their class as ever Puritan can claim to be among the monsters stepping one stick. And granting, for argument's sake, that Puritan did win a pair of days from Genesta, thereby "conclusively proving," etc., etc., then how in the name of sense can we undertake to overlook equally "conclusive proof" of a contrary sort; more "conclusive proof," inasmuch as Clara is of still narrower proportions than Genesta and beat a whole field of the choicest of competing types in place of a single vessel. Perhaps the patriot, the person of all others blind to sense, to logical deductions, thirsting for naught but a chance to air his provincialism in self-glorification, may find all the drink to quench the ardor of his feelings in the performance of the Puritan cross and deem it very convenient to evade such a knock-down blow as Clara's lunge against his self-deception. But the expert, the technical mind, bestowing no thought to the mere sideshow of bunting hung from the peak, and valuing truth for truth's sake and the enlightenment it affords, most decidedly declines to let his reason slip in behest to an uncurbed transport born of that narrow spleen which places a temporary political division in the world above and beyond accurate reasoning and common truth. What the "faiths" and "beliefs" instilled by Puritan's two hacks at Genesta may be, the logical mind goes slow and preserves its balance, when next day the very reverse is equally as clearly established. Swing himself into wild ecstasy as he likes over the meet between one so-called sloop and one cutter and Clara rises before him the next instant to cry a halt to passionate impulse and commands a fresh weighing of the evidence laid bare by other events of equal portent, fraught with an influence he dare not, in justice to himself, venture to cancel or overlook To him, what Puritan did Clara undid. To him, the respite granted the America Cup on this side of the Atlantic means next to nothing. And, being furthermore convinced, upon the unprejudiced testimony of his own eyes, that the Cup remains through no merit in Puritan not equally shared by Genesta, but through luck, barefaced luck which could not escape even an ordinary observer, the recent international races prove to the expert absolutely nothing with which he was not already perfectly conversant. Nor do they prove anything to me. They do not unfold any new lessons. I may quote the races, those of Genesta and Clara as well, in substantial support of the position I have all along taken and in full justification of the cutter's continued existence in American waters. But of that later on. Having made the broad assertion that Puritan won through patent fluke, the reader will call for the facts and ask me to maintain the stand I have taken.

That I will now do.

Through no evidence of my own, for some will insist that I am a partisan. But through direct evidence from a source notoriously prejudiced on record as an ingrained opponent to the cutter in any shape, as an enemy to all progress in American yachting, as a psalm singer to the old sloop trap, a servile upholder of all that is womanish, puny, sickly, in the methods of pursuing the sport. Through evidence from a source to which the Cross of St. George is a fiercer bait than a crimson rag to a bull. Through evidence from a source at all times grossly unfair to any and every departure from the antiquated trap; from a source which has a thousand times born witness to an utter inability to comprehend the cutter in any of her phases; from a source which has for years displayed a constitutional failing to misinterpret the truth concerning such vessels. From a source which nothing short of the heavens dropping could move. And if that source has now been moved, if that source openly declares the so-called victory of the so-called sloop Puritan to be a myth and repeatedly puts it in black and white, that but for Puritan's luck Genesta would have scored, then have not the heavens fallen indeed, and is not my evidence unimpeachable? Have I not established beyond cavil my claim that *luck* decided the contests and not merit?

The two abortive attempts to make races in fickle weather which petered out entirely before the two racers could accomplish the turn can be passed by as of little importance. On the whole these attempts lead to the belief that in very light airs Puritan was a trifle better to windward than the cutter. And this I am ready to acknowledge, though much of Puritan's apparent superiority was due to her being the most easterly vessel and first to catch the airs coming in from the sea in succession, thereby lifting away from Genesta in a fashion she could not have done in true winds, as subsequent competition proved beyond question. But how did Puritan work out on Genesta's weather in the first place, enabling her to reap the benefit mentioned? Simply because Genesta was kept a rap full trying to run the so called sloop's lee after crossing the starting line well blanketed by the Puritan to begin with. Owing to a failure to observe the preparatory signal, Genesta's poor start obliged her to resort to such tactics, and being unable to reach by the Bostonian the inevitable consequence was that the cutter soon found herself settled under the so called sloop's lee and the latter in her higher position got the advantage of each fresh air from the eastward, slowly and steadily lifting away from the Genesta through this good fortune, with which merit of design had nothing to do. I quote, in support of Genesta's bad start, from the *London Field*, Sept. 26:

"At the five-minute signal Genesta was a little too far from the line, under the lee of the Puritan. With the crowd around the committee boat, neither yacht appeared to have seen the fifteen-minute preparatory signal. On the starting signal she hove round clear of the line to reap the benefit of the two minutes allowance to cross, the outcome of which was that both the yachts crossed the line on starboard tack, Genesta 1m. 35s. behind and under the lee of Puritan."

The view I have given above of Genesta's loss at the very start is sufficiently corroborated by the foregoing quotation. As to the erroneous deductions from subsequent proceedings that Puritan was considerably the better of the pair to windward in light airs, let me again quote from the same paper, and ask whether any competent yachtsmen would venture to reach a positive decision from a drift under circumstances which resolved the whole of the business into wretched fluking without affording a fair show for accurate comparison. Says the *Field:*

"With her wind once clear, Genesta appeared to headreach and weather on Puritan."

This is exactly what I observed at the time. As long as the true wind lasted Genesta showed to better advantage than the so-called sloop. And now, what did the rest of the day have in store? The *Field* says:

"At one moment the wind would break them off two points, Genesta would appear to get a lead, and at another the wind would free them and Puritan would appear to be gaining. * * * From 4 to 6 the wind dropped off very fast and came in streaks, making the yachts break off three or four points one minute and luff up the same number another."

Remembering that the yachts were sailing in different water, what conclusions can such a fickle state of the weather justify? Certainly it is rash to deduce superiority for one or the other when the amount to which each competitor was benefited or interfered with by all the breaking off and hauling up is altogether beyond correct estimate? The first attempt summed up only went to prove that Genesta in light winds was at least as good as the Puritan, and that in the fluking in which the day wound up Puritan came out ahead. For my part, with all the experience I have had in observing and sailing innumerable matches, I should hesitate to pass any verdict at all and remain content to abide by the demonstrations of a more suitable day. Yet the patriots sought to convince themselves and the verdant public in general that Puritan had shown herself far and away the better of the two, and the *Herald* and other journals treated us to no end of twaddle about the "superiority of the centerboard over the keel" when not the ghost of superiority there was.

The second trial was equally abortive of final results. The start, Sept. 11, was made in a nice whole sail breeze and a suspicion of a sea. Genesta at once ourran and outwinded the Puritan in most unmistakable style. In fact, the cutter just romped away from the sloop and looked a winner with all ease, when the breeze fell paltry and we were served up with another lot of fluking, during which Puritan, in the rear, brought up the breeze with her, caught the cutter and then fluked out on her weather as in the day previous. I quote in support from the *Field*, Sept. 26: "Genesta went through the line with a clear wind 100ft. to leeward of Puritan and seven seconds astern."

It will be seen that again did the cutter cross to leeward and astern of the sloop, but she did not remain there very long, for, as the *Field* has it:

"Ere they had sailed half a mile it was plain that Genesta was headreaching the Puritan and on the whole weathering out on her, making a steady gain." Now mark, the *Field* says it was "plain" that Genesta was the better of the two and that her gain was "steady." At the end of an hour the superiority of the cutter was even more apparent. Says the *Field:*

"The cutter had eaten out and forereached so far that she was dead ahead of the sloop and still leaving her." Listen to that, "still leaving the sloop" after an hour from time of start. But this is not all. The *Field* continues:

"At the end of two hours Genesta had a lead of a mile and a half and was one point on the weather bow of the Puritan. Suddenly the wind shifted some three points easterly."

That is to say for the two hours the wind held true, the cutter was beating the so-called sloop hand over fist, footing better and holding a better wind. Surely that was test enough to satisfy a reasonable person. Then began a series of shifts and backing, the wind blowing with caprice, favoring first one vessel, then the other, and varying in strength, gradually dropping away to nothing, while the Puritan through fluke of the most evident sort, plumped out on the weather of a yacht which for two hours on a stretch had fairly and squarely beaten the so-called sloop about as she liked. But, Puritan happening to be ahead when the race was declared off, the newspapers next day, incapable of judging the sailing of the boats from a technical standpoint, gave way to pages of screaching and screaming, and the general public cleared out imbued with the nonsensical notion that once again the so-called sloop had "conclusively proven her superiority," etc., etc. All the old stock of fables and all the stuff and gabble about centerboards and beam were rehashed to the intense satisfaction of the ancient school of barnacles and to the hilarious amusement of the "cutter men" who had seen the races and could read between the lines and note a thing or two which escaped the hay makers "writing up" the matches for the landsmen readers of landsmen's publications.

We now pass on to the race sailed Sept. 14 over the inside course of the New York Y. C. During this race the Genesta was so outrageously bothered by the huge fleet of accompanying steamers that the prejudice abroad against such a confined "duck puddle" course was found to be only too well grounded. It is not likely that a foreign challenger will again consent to put himself at the mercy of the excursionists who through inexcusable ignorance or with deliberate intent bothered the life out of Genesta and contributed toward her defeat. I hope that Galatea will insist upon outside races, free from annoyance and in keeping with the size of the contestants. Though the New York Y. C. cannot be blamed for the action of steamboat captains, due diligence to keep the course clear was not exhibited by those in authority. But the committee with justice presumed upon the intelligence and fair play of the steamboat men. In this they were sadly disappointed, and the only way to assure Galatea a fair fight is to appoint all matches off shore, where they ought to be sailed. Says the *Field*, Sept. 26:

"Once clear of Sandy Hook, the steamers kept along on Genesta's lee bow and left a terrible wash behind, literally making the whole sea boil in the line from the point to the Lightship. This was very hard on the English cutter, as her lee decks were continually filled with water, and she of course yawed about badly. It proves conclusively that no satisfactory race for the America's Cup can take place over the New York Y. C. course so long as the steamers follow in such crowds, resembling a town afloat rather than a fleet of steamers out for the day. * * * Genesta was bothered by sailing vessels and yachts working down the shore. * * * The steamers rushed away after Puritan and churned up the water for Genesta. * * * Now began the steamboat bother, as all the fleet, intent on seeing Puritan round the lightship, began steaming away at their best pace, regardless of Genesta, one and all went steaming through her lee. The majority came much too close, and many, after passing her, steamed ahead of her and crossed her bows, and in consequence, for a time, she had their wash all along her deck, which made steering her, to say the least, difficult work. * * * The Genesta, as before, was treated to the wash of the returning steamers. * * * It was useless for Genesta to persevere, as the enthusiastic fleet of steamers cared for nothing but an opportunity to cheer the Puritan."

I have quoted enough to show that a close race would have been decided against the Genesta through the interference of the steamers. So notoriously did one captain behave that the name of his steamer called down upon him universal indignation in the press next day. Now to the race itself and the proof I have to offer that it was won through luck and nothing but luck. C. P. KUNHARDT.

[TO BE CONTINUED.]

AN ENGLISH VIEW OF THE RACES.

THE London *Field* reviews the late races in a very fair and sensible article, which we give below, omitting only the two deeds of gift, which we have published before. There is hardly a point in connection with the deed of gift, the challenge, the two boats and the conduct of both parties, that has not been made by the extremists on one side or the other the ground for complaint and condemnation; and most of the points made are fairly answered in the following article by a recognized authority. Most yachtsmen will agree with the *Field* in its recognition of Puritan's strength and seaworthiness, which some have questioned, and also with its conclusions in regard to the conditions of the matches. The two points that have been advanced in Genesta's favor—that she is not a fitting representative and that the allowance is against her—are also finally disposed of; while the rash conclusions of some, that English yachtsmen must at once build wide boats, is also answered. On the whole, the conclusions are the fairest that have yet appeared on the subject, and will do a good deal to clear away the rubbish with which it has been befogged by ignorant writers on both sides, and to prepare the way for an intelligent study of the races in all their bearings:

If the matches between the Genesta and the Puritan did not excite much interest or speculation on this side of the Atlantic before they were sailed, they have provoked enough criticism since, and of a very diversified character. One paper insinuates that the owners of the Genesta must have been somewhat of a simpleton to have gone to New York at all, to compete under such conditions as are imposed on the challenger for the Cup in the "deed of gift;" and, further, that he was "generous to a fault," or, in other words, simple, not to have accepted the offer of the committee to sail over the course after the Puritan had carried away Genesta's bowsprit. It is pointed out that Puritan evidently intended to have gone alone had she not been brought up with a round turn by the committee, and her owner is said to have first claimed the race because it was Genesta's bowsprit that hit Puritan. This reminds one of the Irishman who knocked a man down, and then upbraided him for running against his fist. Touching this incident, one correspondent from America writes: "So far as Genesta is concerned, they (the Americans) think it was foolish not to take the offer to sail over, although they admit the English would never have heard the last of it had Sir Richard Sutton done so."

Now, we are inclined to think that Sir Richard Sutton, instead of exhibiting any child-like simplicity in not sailing over, showed a good deal of shrewdness; for, as the writer we have quoted from admits, the English would never have heard the last of it. Beyond this, it is by no means certain that Genesta could have got round the course in the stipulated seven hours, and, if she had not, a more ludicrous situation could not be well imagined; and so, on the whole, we think that the people on this side of the Atlantic have every reason to be satisfied with the course adopted by the owner of Genesta.

Now as to the conditions. They may or may not be exactly as we should have drawn them, with the knowledge that we had to be the challenging parties; and, on the whole, they, as might be expected, put the challengers in a worse position than the challenged The conditions under which a challenge could be made were thus laid down in the original deed of gift.

* * * * * * * * * * *

It must be borne in mind that these conditions were made with a full knowledge that the Cup at some time or the other would be won and that American yacht owners would become placed in the position of the challengers; yet knowing this, they have, with the greatest propriety, stipulated that the challenging yacht must sail to New York on her own bottom. A more wholesome condition could not have been introduced, and the fireside stories that a yacht like Genesta is obliged to be exceptional in form and strength in order to cross the Western ocean, while the Yankee yacht need only be a mere skimming-dish, with timbers like a skiff and plank like veneer, are so much twaddle. Judging from the proportion of ballast which Puritan has to weight of hull, she is a heavier built vessel than Genesta, the difference in weight of material and equipment amounting to pretty nearly 20 per cent.

Then as to the form of Puritan. An opinion seems to prevail that she must be utterly unseaworthy, and quite unfit to cross the Atlantic; but the probability is that if she and Genesta started to race from New York to the Lizard, that Puritan would make the faster run, although she might not in going the outward passage. It must be recollected that Puritan has within a few inches as much underwater depth of body to the rabbet of keel as the famous America herself, is by no means the shallow craft that an American centerboarder usually is, and such draft as she has is nearly all body and not mere deadwood and lead keel; and it must be remembered that at the date when the America first visited us, she would have passed muster as quite a deep bodied craft. Here are some dimensions of yachts which existed at that period:

Name.	Rig.	L.W.L.	Beam.	Draught to Rabbet
Mosquito	Cutter	59	15.3	8.8
Pearl	Cutter	66	19.5	8.0
Dream	Cutter	63	18.8	7.8
Fair Rosamond	Schooner	76	21.0	7.5
Xarifa	Schooner	90	22.0	9.0
Erminia	Schooner	92	22.7	9.6
Novice	Schooner	66	16.0	6.9

It must be remembered that none of these vessels had lead or iron keels, or any lead ballast at all, yet they managed to keep the sea. Most of these yachts did the blue waters of the Mediterranean, including the little Novice when owned by the late Andrew Arcedeckne; but we must not forget the Christopher Columbus sloop, of about 25 tons, that crossed from New York to Cowes in 1857, and the Alice, about the same size, which came over about the year 1860; or the Vesta, centerboarder, drawing only 7ft. of water, which raced across before the westerly gales of December, 1866, from New York to the Needles, in 14 days 4 hours, the Henrietta doing the same distance in 13 days 22 hours. Recollecting all this, and a great deal more of the same kind, we are inclined to laugh when we see it gravely questioned if Puritan could keep the sea. Whether or not she could beat Genesta on the western passage would be very much a matter of chance, as it was when Cambria beat the Dauntless in 1870; but coming the other way the chances would be largely in favor of the Yankee.

Beyond the question of seaworthiness, a point has been raised as to the fairness of making a keel yacht compete with a centerboarder, as the latter can skim over the shallows of New York Bay. There need be no apprehension about this, as the deep channel is well buoyed, and it was a part of the conditions that, for the match sailed from Staten Island to Sandy Hook, the yachts were to keep on the channel side of the buoys. It is true, between the Hook and the Lightship, it is just possible that some advantage might be taken, as Columbia took in the Livonia races of 1871, by working over the flats near No. 5 and No. 8½ buoys, but it would not be great. The other two matches were to be sailed in deep water outside Sandy Hook. Under these conditions we see no objection to a centerboarder competing with a keel yacht, especially when the former is a kind of half-breed like the Puritan. Whether or not there is, on the whole, any advantage in a centerboard, is a moot point; but, looking at all the circumstances, most of us on this side the Atlantic would be dead against any such contrivance.

Exception has been taken to the conditions, because six months' notice is required from the challenger, in order that the club holding the Cup may, if necessary, have time to build a boat to meet the challenger. The object of this condition is objected to, and the fact that if the Puritan had not been built, Genesta would have won the America Cup, is pointed out as conclusive evidence that the condition must be all wrong. But a moment's reflection will convince any one that it is "all right," and without it any club holding the Cup would be placed at a great disadvantage. This is clearly shown by the easy manner Genesta defeated the Gracie and others; and, as before said, it must not be assumed that the New York Y. C. will always be the holder of the Cup.

We last week referred to the remarks which have been made as to whether Genesta has a right to be considered a fit exponent of the excellence of English cutters, and writers continue to comfort themselves that, although Puritan beat Genesta, she could not beat Irex. Into the relative merits of Puritan's and Genesta's performances we will not now enter, because we know little or nothing about what was really the test match—that sailed on the last day—except that Genesta ran the Puritan dead to leeward part of the course. But that proves nothing, as the Cambria could run the Sappho with the wind dead aft; but we all know the cause of the speed being pretty uniform between yachts, large and small, when running away from the wind. But whether Genesta did or did not show better speed than Puritan, there can be no doubt, judged by her last year's performance alone, that she is good enough to try the merits of the yachts of America, and this is proved by the easy victory she had with Puritan out of the way. Beyond this it is miserably poor satisfaction to comfort ourselves by belittling the prowess of our adversary.

One curious outcome of the fortuitous success of the Puritan is that a good many, both on this side of the Atlantic and on the other, have hastily concluded that the English type of yacht is all wrong and that we must at once break them up, alter our tonnage rule and build yachts like the Puritan. Another set of critics sees nothing in the defeat of Genesta but evidence that the English type of yacht is right and that Genesta actually won the race, because by the Y.R.A. tonnage rule one is eighty tons and the other 141 tons, equal to nine or ten minutes in a forty miles' course. We do not agree with the former nor yet with the latter, and, so far as the contention that our type of yacht is wrong is concerned, we feel sure that the American type will never, even in the Anglo-American type represented by the Puritan, be adopted in this country.

As to the Puritan being 141 tons and the Genesta only 80, there would be some reason in pointing to this difference if the Y. R. A. tonnage rule were a sort of natural and unerring law by which the merits of sailing could be measured; but the fact is the Y. R. A. could frame a tonnage rule to make Puritan a thousand tons and Genesta only forty if they like, and when we come to sum up the merits of the two, we must look at them through a medium very different from the Y. R. A. tonnage rule. If we say that the Y. R. A. tonnage rule must be right because it happens to penalize Puritan for having 7 per cent. the greater sail spread, the inevitable and logical conclusion would be that the British type of yacht is all wrong because Genesta has about 35 per cent, the greater underwater body, and yet for match sailing is rated by the Y. R. A. rule, and apparently with some reason, as an inferior boat. It should be noted, however, that, in the match sailed in a good breeze, Puritan took down her topsail, while Genesta did not, so the sail spread per ton of displacement would have been pretty nearly equal in the beat to windward. The conclusion to arrive at is, so far as particulars have yet come to hand, that the Y. R. A. rule absurdly overestimates the value of beam, and that a "compromise" between the sloop and the cutter must be very much more "cutter" than even Puritan is to compete with anything like success against British yachts in a whole sail.

Our special correspondent expresses an opinion that there is nothing afloat which can touch Puritan in a light breeze. This can be readily understood when we consider the small wetted surface she must have to sail spread, and the trouble which was taken to get that surface into the best possible condition of smoothness. He further makes it clear that the Genesta had the advantage to windward so long as there was enough wind to make them bend and a slight heave of sea; how it was that, under such conditions, Puritan managed to beat Genesta, we must wait our correspondent's further report.

In the last issue the *Field* also adds: "A good many of our yachting readers appear to have formed the opinion, because Puritan can beat Genesta in a light wind and on a reach in a strong wind, that we must imediatety alter our tonnage rule in order that beamy yachts may be built on this side of the Atlantic. The fact is, however, that the achievement of the Puritan tells us nothing beyond what we knew before, and has emphasized what we all know, that the Y. R. A. rule absurdly overestimates the value of beam for ordinary match sailing, especially as centerboards are vetoed We should be very sorry to say that a yacht like Puritan would be useless on this side of the Atlantic and that she could not go round the coast. Such like nonsense; but we think that with a fixed keel she would stand very little chance against our vessels if rated by the Y. R. A. tonnage rule, to allow a yacht like Genesta a quarter of an hour over a 50-mile course.

"So far as regards altering the rule, before that is done we should like to see if a yacht of 43¼ beams, 80ft. on the loadline, could not be built to beat those of about 51½ beams, on the same length. We think the experiment quite worth trying, although there would not be much chance of its succeeding in the small classes. Such yachts would have 2ft. more beam than Genesta (that is, 17ft.), and would have to allow her 1min. 9sec. over a 50-mile course. This penalty does not look more than she ought to be able to do; and adding 2ft. to such a craft as Genesta would make in many ways a very much improved vessel, and especially in a seaway, although occasionally there may be a particular kind of sea met with which the narrower boat would get through the faster. Examples of this have occurred over and over again in yachting experiences, and they have rather tended to mask the fact that for any given tonnage a yacht is not always what may be termed an efficient performer in a sea simply because she is narrow, but because she is long and deep. If, however, a yacht has a beam much in excess of two-tenths of her length on loadline, the beam will begin to tell against her in a head sea, but she will not necessarily be a bad sea boat."

THE SUPPLY OF TEAK.—This wood, so liberally used in the deck fittings of all English yachts, probably has no superior for the purpose, as it is strong, durable, takes a good polish, and is practically unaffected by the weather. Thus far it has been difficult and expensive to obtain here and is little known. This year the English supply has been smaller than usual, and will continue so for at least a year, according to the latest reports. The supplies to come from India and Burmah are not only smaller in quantity, but the wood is of poorer quality than usual, and the logs are smaller in size, averaging 37 to 38 cubic feet per log in place of 40 to 42ft., the regular average. We believe there are no dealers in New York who keep teak wood regularly in stock; if there are we shall be pleased to know of it, as some of our amateur builders would be glad to try it. That used on the cutters built here has been specially imported from England, or has been obtained in small quantities from spars fitted to ships in East Indian ports.

A FAST PASSENGER STEAMER.—The new sidewheel steamer Ireland, built by the Lairds, of Birkenhead, for the route between Holyhead and Dublin, has proved very successful, making an average of 20¼ knots on her trial trip between Holyhead and Kingstown. Her engines are 8ft. 6in. in diameter, with the same stroke, making 27 turns. With forced draft her indicated H. P. was 6,337, the speed being as stated; while on another trial with natural draft the engines indicated 5,111 H. P. and the average speed was 18.9 knots over the same course. Her draft is 13ft. 9in. It is evident that the Messrs. Laird have lost none of the skill for which they were famous when they built the Anglo-Rebel privateers and blockade runners of 1862-65.

TORONTO Y. C. HANDICAP RACES.—A sealed handicap race was sailed on Saturday last by the second and third class yachts of the Toronto Y. C., eight entering. The allowances were: Gypsy allows Mischief 5min., Guinivere 12, Bonita 15, Jamboree 15, Wah-wah 15, Daisy 25, Wild Mag 35. The course was from the front of the club house, through the western gap, thence south and around a spar buoy near the bell buoy, thence back through the western gap, through the bay, around a buoy in the eastern gap and back across the starting line, 10 miles. A one-gun start at 2:45 P. M. sent all away with a light south wind; but on the line Jamboree luffed, Gypsy, following close astern, striking her with her jibboom, but doing no serious damage. Gypsy soon led, with Mischief in full chase, but astern at first mark, while Bonita and Guinivere were trying for second place. Coming in the wind drew more aft, and spinnakers and balloon jibs were set. The times at the eastern buoy were: Gypsy, 4:14:20; Mischief, 4:16:50; Guinivere, 4:39:50; Bonita, 4:42:00; Jamboree, 5:24:00. On the last leg Gypsy still led, until near the finish she was becalmed, Mischief continuing on her way for a time, but finally she lost the wind too, but succeeded in crossing 28sec. within her allowance. The times were:

	Start.	Finish.	Actual.	Corrected.
Gypsy	2 45 00	4 32 20	1 48 20	1 48 20
Mischief	2 45 00	4 37 50	1 52 52	1 47 52
Guinivere	2 45 00	5 04 00	2 19 00	2 02 00
Bonita	2 45 00	5 17 50	2 32 50	2 17 50
Jamboree	2 45 00	5 43 40	2 58 04	2 43 40
Wild-Mag	2 45 00	5 48 30	3 03 30	2 28 30
Daisy	2 45 00	5 58 00	3 13 00	2 48 00
Wah Wah				

The handicaps were made by Messrs. C. J. Townsend, Fulford Arnoldi and W. Dickson. Gypsy and Jamboree have each protested against the other. The first prize was a set of signals presented by Vice-Commodore Cosgrave, the second was the entrance fee, and the third a money prize presented by the Commodore. This finishes the season, but the club will endeavor to keep up the interest through the winter by a series of meetings, at which instruction will be given in knotting, splicing and similar work.

NEW HAVEN Y. C. FALL REGATTA.—The New Haven Y. C. closed their season on Oct. 7 with their fall regatta, over the regular course, 10 miles to windward and back for Classes C and D and a short course inside for Class E. The race was sailed in a good lower sail breeze from S.W., the start being made at 11:33 A. M. with the following starters: Class C.—Wild Duck, Alexander Lutz; Rajah, Commodore J. G. Beecher; Happy Thought, G. M. Graves. Class D.—Endeavor, ex-Commodore H. D. Billard; Wanda, Messrs. Waterhouse & Dunham; Anita, George W. Adams; Vixen, Allen Seaman; Stranger, John N. McAuley. Class E.—Alice, E. W. Smith; Roamer, H. W. Avis. Starting with topsails and jibtopsails the freshening breeze soon brought in the kites. Endeavor steered direct for the mark, but the others sailed some distance to the leeward of it. A shift of wind helped the latter, and Wild Duck and Stranger both turned ahead of Endeavor. The full times were:

CLASS C.

	Start.	Actual.	Finish.	Corrected.
Wild Duck	11 43 30	2 50 10	3 15 40	3 15 40
Happy Thought	11 42 40	3 03 05	3 26 25	3 20 14
Rajah	11 41 41	3 15 15	3 33 33	3 28 58
CLASS D.				
Stranger	11 36 55	3 07 55	3 30 50	3 25 10
Vixen	11 33 25	3 16 37	3 43 12	3 36 12
Endeavor	11 33 10	3 11 50	3 38 40	3 38 37
Wanda	11 33 30	3 14 30	3 41 00	3 39 16
Anita	11 35 20	3 15 20	3 40 40	3 40 40
CLASS E.				
Alice	11 33 00	2 23 30	2 50 30	2 50 30
Roamer	11 35 40	3 22 00	3 46 20	3 43 20

Wild Duck wins class prize in Class C and Happy Thought the regatta committee's prize for best elapsed time outside of class prize winner. Stranger wins the class prize in Class D and Endeavor the Commodere's prize for elapsed time. Alice wins in Class E.

MICHIGAN Y. C. REGATTA.—The fall pennant regatta of the Michigan Y. C. was sailed on Oct. 8 in a fresh N. W. wind. The course for second class was from the anchorage around Westcott's lightship, around the ice breaker off Mewberry and McMillan's wharf, Grosse Pointe, down the Canadian channel past Belle Isle, around the Nile buoy, and back to anchorage. That for third class was around Westcott's lightship and back. The yachts were: Second class—Jennie June, Capt. June; Petrel, A. J. McLeod; Turk, Mr. Hopper; Cassie J., Andrew Kramer; Adele, Mr. Phillips; Madeline, Mr. Emmet. Third class—Nona, B. Wendell; Laylow, Mr. Schweckart; Satin. Only two yachts, Jennie June and Petrel, carried topsails and jibtopsails. These two led over the course, Jennie J. ahead until the last mark was passed, when Petrel overtook her, winning by 40sec. Adele was third and Madeline fourth. Nona won in the third class by 24min. and Flush won in the fourth class open boats.

A CHALLENGE FROM GALATEA.—Mr. J. Beavor Webb was called home by business and left quite hurriedly on the Elbe last week. Before sailing he sent to Secretary Minton, of the New York Y.C. a challenge on behalf of Galatea to sail a series of five matches for the Cup, as late in the season as possible, which challenge will be considered at the meeting of the club on Oct. 22. Mr. Webb also sent the following letter to Mr. Minton: "Tuesday, Oct. 6, 1885. My Dear Mr. Minton—I have received some letters to-day which render it necessary for me to return to England at once. I leave two photos —one of the Genesta and the other of the Galatea— for the New York Y.C., which I trust they will accept as a small souvenir of the very pleasant time I have spent in America; also of the great pleasure I have experienced in meeting American yachtsmen and their kindness to me, and trusting that if I do not live long enough to win back the America's Cup I may at any rate live long enough to find that English and American yachtsmen may each day become better friends, and in the interest of the sport sink all prejudice as to cutter, sloop or centerboard type, so that one day we may adopt a uniform type of yacht, be it what it may, and never forget the great zest given by the New York Y.C. to yachting by its open and sportsmanlike defence of —if I may so call it—that national institution, the America's Cup. I bid you au revoir, not goodbye, as I hope ere another year is over to meet you once more and, win or lose, return to England with an increased appreciation of the country and the sportsmanlike feeling shown by the members of your club to foreign yachtsmen. With earnest good wishes for the prosperity of American yachting I remain yours, very truly, J. BEAVOR WEBB." Mr. Webb takes with him an order for a design for a large steam yacht for an American gentleman.

YACHTS LAYING UP.—Clara has laid up for the winter at Salem, Madge is hauled out at Piepgrass & Pine's yard, in the Seawanhaka Basin are the schooners Nokomis and Sea Witch, the cutters Oriva, Mona and Estelle, formerly Wilful, the sloops Venture and Gael, while the Topsy and Cruiser are on the beach. At the old basin, now in charge of Captain Jake Schmidt, are the Isis and Espirito, with several other yachts. Lawleys have hauled out at South Boston the Nebula, Gevalia, Kelpie, Dorothy Q., Clio, steamer Princess, Fan, Magnet, Thialia. Smith has hauled out the Egeria, Nydia and Phantom. At Salem, Joshua Ward's yard, are the Tulip, Mist, Romance, Priscilla, Tioga, Ariel, Satan, Loon, Holby, Clytie, Nautilus, Medusa and Caroline. The Foam, schooner, is laid up at Mystic, the little sloop Atalanta is at Mattapoisett, the Bedouin, Ileen and Wenonah are at Newburgh, N. Y., Priscilla is at her builders' yard in Wilmington, Puritan is at Salem, Mass., with Fearless. Bonita, Whitecap, Winona, Halcyon, Rebecca, Latona. Madeline is at Greenport, Gracie at Glen Cove and Hildegard at Nyack. The steam yacht Tillie winters as usual at Piepgrass & Pine's, where the Orienta is being overhauled. Atalanta and Nourmahal are now at the Erie Basin. Nearly all of the Atlantic Y. C. yachts are laid up at the club basin, or at Mumm's next to it. Mumm is busy with the sharpie Vidette, putting two tons more lead on her keel, 6 tons altogether. He also has made some alterations in the Wivern, schooner, and has the Vixen, an Eastern built sloop, up for repairs. At the Chelsea Bridge, Boston, are laid up afloat the Marion Wentworth, Breeze, Sport, Actæa, Phantom, Mohican, Addie, Active, Recreation, Annie G., Josephine and pilot boat Fleur de Lis.

GENESTA HOMEWARD BOUND.—By this time Genesta is no doubt well on her homeward way, as she sailed from Staten Island on Thursday last. Mr. Francis P. Osborn, formerly owner of the schooner Nettie, made an offer of $20,000 to Mr. J. Beavor Webb, but the price asked was $30,000, which Mr. Osborn was not willing to pay. It had been intended to return with the racing mast, which is only 4ft. 6in. longer than the jury mast which brought her over, but some of the crew objected to the larger stick, and on Oct. 2 she was towed to Poillon's yard and docked alongside the bark N. Thayer. The bark's mainyard was well stayed with lifts from the topmast head and one to the dock on the port side, and a fall rigged and carried to the bark's capstan. Her mast was then hoisted out and the jurymast stepped. On Monday she towed down to her old anchorage, where the rigging was completed, her trysail bent and provisions and water taken on board. The lower streaks of planking in her bulwarks were also removed. Her navigator, Capt. Saunders, joined her and by Tuesday all was ready, but owing to the storm she did not start. On Thursday, when the N. E. storm was over, she started away from Tompkinsville at 3 P. M., receiving farewell salutes from the few yachts at the anchorage, as well as from the shore. Only 16 of her crew returned with her, as 3 of them, the steward, carpenter and a seaman declined to do so and remained ashore, the two former returning by the Germanic. Her spars and small boat will go back by steamer.

TORONTO SKIFF SAILING CLUB.—An open handicap race was sailed on Oct. 3 by the Toronto Skiff Sailing Club, starting at 3 P. M., there being 24 entries. The winners were Psyche, Zip and Vectus. Several of the boats were disabled by minor accidents.

THE POLYNIA FOR SALE.—The steam yacht Polynia, well known by her yellow stack and three masts to all who witnessed the late races, will be sold at auction at 85 Pearl street, New York, on Oct. 27, at 12 M., by order of her owner, Com. James Gordon Bennett. The Polynia was built by Ward & Stanton, of Newburg, in 1880 and is 154ft. 5in. over all, 18ft. 5in. beam and 11ft. draft.

LAPWING.—This cutter, designed by Mr. Dixon Kemp and built by Lawleys for Mr. J. Malcolm Forbes, lately made a good passage from Martha's Vineyard to Boston, her time to the lower light being 15h. 15m., partly under three-reefed mainsail and third jib. She will lay up at Lawley's for the winter, having been purchased by Mr. C. A. Welsh.

LADY BEATRICE.—Messrs. Ramage and Ferguson, of Leith, Scotland, lately launched a steam yacht of 350 tons, built of iron, for Capt. Townley Parker. She is 145ft. long, 22ft. beam and 13ft. 6in. draft, with engines 18 and 36×24in.; 85lbs. working pressure. She will be lighted by electricity.

TRIPLE COMPOUND ENGINES.—The use of the triple expansion engine in steamships is constantly increasing abroad, the latest list of launches in British shipyards, as given in the *Shipping World*, showing nine steamers thus fitted out of a total of twenty-six launched.

NYSSA.—This Boston sloop, for some time owned by Mr. Wall of New York, has lately been enrolled in the Knickerbocker Y. C., having been purchased by Mr. Quinn, former owner of the Aria. This makes one more keel in the K. Y. C.

NIRVANA.—The yacht of this name lately purchased by Mr. T. H. Hall, of New York, is not the large schooner, formerly the sloop Julia, but a keel sloop, built by Lawley & Son, 41ft. 6in. on waterline, 15ft. 2in. beam and 7ft. 5in. draft.

DINNER TO MESSRS. BURGESS AND CROCKER.—On Oct. 8 the Merchants' Club of Boston entertained Mr. Edward Burgess and Captain Crocker with a dinner at the Parker House.

THE DAUNTLESS AGROUND.—On last Friday the schooner Dauntless ran ashore on the rocks off Fort Adams, Newport Harbor, but was towed off with little damage.

AMBASSADRESS.—Mr. Astor's huge schooner, that has been lying idle for several years, has just been sold by Manning's Agency to Mr. Nathaniel Thayer, of Boston.

CARMELITA.—Mr. Coleman's schooner arrived in New York last week from Montevideo. She will be sold here as her owner is now in Europe.

SPERANZA.—This schooner, built only last season, has been hauled out at Carll's, City Island, to be completely rebuilt.

Answers to Correspondents.

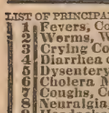
☞ **No Notice Taken of Anonymous Correspondents.**

ACCOMAC.—"Uiesote" can be had from H. F. Taintor, 281 Pearl street, New York, who is the agent.

W. A. M., Pensacola, Fla.—Genesta was not built for the international race, but for the regular English races.

F. T. S., West Springfield, Pa.—Builders usually make the blocks themselves out of bone or ivory, or sometimes boxwood.

J. M. F., Philadelphia.—Go to Lewes, Delaware, and down to Watchapreague Inlet. There go to the fish houses or the life saving station and get a pilot to take you to Hog Island.



J. B. T., Eaton, N. Y.—We wish to sow some wild rice in the ponds in this vicinity. Will you please tell us when, how, and where to sow it? Ans. Sow in shallow water in the late fall and early spring.

G. E. B., San Francisco, Cal.—We can recommend no special make. Several varieties have been described and advertised in our columns during the past year, and the subject is fully treated in "Small Yachts."

C. H. Y., Boston, Mass.—The articles on canoe building were published throughout 1884. They have since been rewritten and published in book form in "Canoe and Boat Building for Amateurs." Price $1.50, at this office.

F. S. C., Logan, O.—I have just received what to me is a strange bird. It is in length 6in., breadth 9½in., tail 2¾in., eyes pink, bill light yellow, legs light yellow, entire bird light canary color. It was seen in company with wood pewee (*Contopus virens*). It is evidently a young bird and was fed by these flycatchers, or as they are often called, bee birds. Its bill is almost identical with that of the tyrant flycatcher (*Tyrannus carolinensis*). Ans. Probably an albino *Contopus virens*.

SMALL YACHTS.

Their Design and Construction, Exemplified by the Ruling Types of Modern Practice.

By C. P. KUNHARDT.

The Forest and Stream Publishing Company takes pleasure in announcing the immediate publication of a magnificent folio volume, bearing the above title. This book is intended to cover the field of Small Yachts, with special regard to their design, construction, equipment and keep. The opening chapters are devoted to a consideration of the model and the draft, their relations to one another, and the purposes which they subserve. Full directions are given for producing the plans of a yacht with reference to the chief points in design, and the method of taking off the lines of a boat already built is likewise described in detail.

All elements entering into design, such as Resistance, Stability, Balance of Rig, Handiness, Displacement, etc., are dealt with in separate chapters. The rules necessary for the mathematical computations, and a review of theory and practice close the first division of the book.

The second portion comprises the description of the Plates, covering the whole range of type in small yachts, from the shoal catboat and American centerboard sloop to examples of the narrowest and deepest British cutter yet built. These yachts have their lines, build and fittings depicted in the Plates, which are drawn to scale. With their aid and the specifications presented, the reader is placed in possession of accurate information concerning the mould, accommodations, rig and characteristics of all styles of yachts which have received favorable recognition. Sporting boats, combination row and sailboats, and various examples of special form are introduced.

The third division offers a comprehensive review of single-hand sailing, to which small yachts are especially adapted. Directions are given as a guide in selection of type and sail plan, and subsequent equipment and proper management.

The iron work of yachts, their gear, yawls, stearing apparatus, boat building and much other closely related matter is entered upon. The new International Rules of the Road, Signal Service, and a bibliography appear in the Appendix.

The work is profusely and handsomely illustrated with 150 illustrations inserted in the text, besides the sixty-three plates as follows:

LIST OF PLATES.

"FOREST AND STREAM SERIES."

DEER HUNTING.

BY JUDGE JOHN DEAN CATON.

BY and by it will be time to hunt antelope and deer. It is always time to read about them. Judge Caton's book on the antelope, elk, deer, moose and caribou of America discusses in a readable way the life history of these animals and the methods of their capture. It is the work of an enthusiastic sportsman who has had a wide experience and has devoted the leisure of years to studying these interesting game animals. The volume is very fully illustrated, and is a perfect storehouse of information and entertainment. The first edition was sold by the Boston publishers at $4. Price $2.50.

WOODCRAFT.

BY "NESSMUK."

A COMPACT pocket handbook of condensed, boiled-down, concise, clear, comprehensive, sensible, practical camp gumption. "Nessmuk" has been "in the woods" in Michigan, New York, Pennsylvania, and South America, and this is a book for outers, wherever they kindle their camp-fire. The author believes in "smoothing it." He has learned how; now he tells others. It is much easier to learn from "Nessmuk" than from Dame Experience. We should not be surprised if "Woodcraft" completely revolutionized the methods of camping out. If you are going to the woods, read "Woodcraft" before you go. It may add to your trip a hundred fold. Price $1.00.

DOG TRAINING.

BY S. T. HAMMOND.

HE was a promising puppy, and when you turned him over to the breaker to be educated, you thought he was bound to make "the best dog in the world." And you'll not soon forget how disappointed and disgusted you were when the dog, the breaker and the big bill—all three turned up together, and you saw that the animal's spirit was broken and it would take a steam calliope to make him mind. Now, this could not have happened if you had been wise enough to buy a copy of Hammond's book, and in your odd leisure moments *train* the dog yourself instead of having him *broken* by some one else. We are selling edition after edition of this book, and it is revolutionizing the system of preparing dogs for work in the field. Price $1.00.

SHORE BIRDS.

A PAMPHLET for those who "gun" along the shore. Tells of: I. Haunts and Habits—Where the bay birds live and what they do at home. II. Range and Migration—Where they go to breed and where to spend the winter. III. A Morning Without the Birds—An episode of shore shooting. IV. Nomenclature—A list of our American species of *Limicolæ*, with a description of each species. V. Localities—Where to go to shoot them. VI. Blinds and Decoys—How to shoot them after you have reached the grounds. 45 pp., paper. Price 15 cents.

ANGLING TALKS.

BY GEORGE DAWSON.

AS a political writer of conceded power, Mr. Dawson wielded a trenchant pen; when he terned from the conflict of parties to the praise of the favorite pastime of "simple wise men," his essays, limpid as the crystal streams, are aglow with the soft summer sunlight and melodious with the songs of birds. When angling was the theme, he wrote from a full heart and in closest sympathy with the scenes and pursuits described. These "Talks" are brimful of manly, wholesome sentiment; there is in them all not a particle of cant. Their sincerity and overflowing spirit at once win the reader, and he perforce shares the author's enthusiasm. The effect is magical, like that of the mimic players in Xenophon's *Memorabilia:* he who reads, if he be an angler, must go a-fishing; and if he be not, straightway then must he become one.—*Extract from Publishers' Preface.* Cloth, price 50 cents.

CANOE "AURORA."

BY DR. C. A. NEIDÉ.

A CHARMINGLY written and always entertaining account of a canoe cruise from Lake George, New York, down the Ohio and Mississippi Rivers to the Gulf of Mexico, by the Secretary of the American Canoe Association. To read the cruise of the "Aurora" is the next best thing to having made it; and the reading is decidedly more pleasant than would have been participation in some of the misadventures related. 216 pp., cloth. Price $1.00.

F. A. ALLEN'S SPECIALTIES.

MONMOUTH, ILL.

ALLEN'S DUCK CALL—Improved, Nickel Plated; the most natural-toned, easiest-blowing, smallest and only Metal Duck Call ever invented and the only one that perfectly imitates the *wild* duck. Sent by mail on receipt of $1.

ALLEN'S BOW-FACING OARS—Can be attached to any boat in five minutes, shipped instantly in the roughest water; work much easier than the common oar. In duck shooting they are invaluable; you see the bird the instant it leaves the water. Sent by express on receipt of $8.

ALLEN'S SHELL WAGE—Will reduce brass shells to their original size in one-half minute, making them as smooth and solid as when new. On ordering mention gauge wanted. Sent by express for $1; by mail $1.30.

ALLEN'S DECOY DUCK FRAME—Is a simple device for holding the dead duck in a natural position in the water. Price $4 per doz. **SEND FOR CATALOGUE FREE.**

FOR PROFIT AND PLEASURE.

The gun shown above is our **NEW COMBINATION AIR GUN.** This is the most complete arrangement ever offered. It combines two pieces in one (a perfect Rifle to shoot a regular 22-100 cartridge, and a superior Air Gun to shoot darts, slugs and shot). It can be instantly changed from one to the other, and has a steel barrel rifled. All the parts extra heavy, and so constructed of best material to stand continuous service, making the most durable gun manufactured, and by far the most practical long-range Air Gun ever made for gallery or field. WE MANUFACTURE A FULL ASSORTMENT OF AIR GUNS SUITED TO MEET THE TASTES AND WANTS OF EVERY ONE. The quality of our goods has established them in all the principal markets of the world, and their superiority has induced the United States Navy to place them, with success, on their school ships. ☞Illustrated price lists sent upon application. CANOE

THE FOREST AND STREAM began a year ago the publication of a series of papers on canoe construction, by Mr. W. P. Stephens, of the New York C. C., widely known as an expert on canoe design and building. These papers, having appeared through the year in our columns, have since been rewritten, and with numerous additions are now published in a handsome volume under the title of "Canoe and Boat Building for Amateurs." Mr. Stephens is peculiarly fitted for the preparation of such a work, beginning as an amateur, and having after a long experience of the difficulties attending a learner, taken a prominent place among canoe builders, due both to the model and workmanship of his canoes. Realizing fully the difficulty of explaining to a novice an art in itself far from easy,

AND

and with which he is entirely unfamiliar, the book begins with a description of the various classes of canoes in general use, with their main features and dimensions, and definitions of the terms used in connection with them. Numerous examples of canoe are given, and in connection with them, such plain instructions in designing as will enable the beginner to select intelligently the proper craft for his pur-

BOAT

pose, and to plan her dimensions, details and fittings. To this end designs of all classes of canoes are given, with full dimensions and details. The object has been not merely to enable the tyro to build one boat as described, but to teach him the principles of designing and building in such a way that he may construct such a craft as he desires, following the chapters on designing, the construction of a canoe is taken up in detail, the tools and appliances being first clearly described, as well as the various materials, after which follows the actual work of building. Every operation is taken up in order, from the selection of the keel to the varnishing of the finished boat, and illustrated with numerous diagrams.

A chapter on sails describes all the varieties in use by canoeists, down to the new Mohican settee, with directions for making, rigging and measuring them, while the method of proportioning the sails to the boat is clearly explained, all the calculations

BUILDING

being worked out in detail. The many minor points of a canoe, paddles, steering gears, rudders, aprons, and camp outfit are also described at length, while a chapter is devoted to canvas canoes.

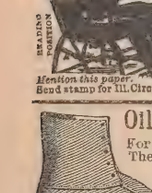
The subject of boat building is fully treated, a rowboat of the usual construction being taken as an example, and described in all its parts in such a manner as to make clear the principles involved, and their application to any form of boat, either lapstreak or carvel build. Each of the numerous technical terms belonging to the subject is defined clearly when it first occurs, and as the index is full and complete, the book is in itself a glossary.

In addition to the numerous diagrams in the body of the work, twenty-four large plates are printed on bond paper, containing the working drawings of canoes for paddling, sailing, cruising

FOR

and racing, with their sail plans, rowing sailing boats, large canoe yawls, and various boats for special purposes, such as gunning boats, yacht boats, and the widely known sneakbox.

The canoe yawl, a boat between a canoe and a yacht, is illustrated by examples of various craft from 17 to 20ft. long, and suitable for a crew of two or three on a cruise. This class of boat, while little known among us as yet, is admirably fitted for cruising, and will meet the wants of many who object to a canoe as being too small, and yet desire a boat with the same excellent qualities. The boats and canoes illustrated are in all cases among the best of their class, the list of canoes including English, Scotch and American craft, and are all drawn



AMATEURS.

to scale, so as to be available as working drawings. The plates, for convenience in using, are placed loose in a tough manilla envelope and accompany the book.

Pp. 168, with 24 plates of working drawings. Price $1.50. Address,

Canoe and Camp Cookery.

By "SENECA."

A practical cook book for canoeists, Corinthian sailors and outers. Practical because the author gives explicit and intelligible directions for preparing such dishes as he has himself actually tested in camp and on a cruise. This is just where the recipes differ from the absurdly impracticable dishes given in some so-called camp cookery books. The cooking outfit is described, and numerous hints on camp economy add to the value of the work. Cloth, 96 pages. Price $1.00.

FOR SALE.—ONE ENGLISH FOXHOUND bitch, 4 mos. old; one English foxhound bitch, 18 mos. old (imported Watchman ex imported Venus). Stock spaniels, setters and bull-terriers for sale. Price very reasonable. L. N. EDWARDS, Box 84, Oxford, Me. oct15,1t

---

FOR SALE.—TWO BLACK, WHITE AND TAN English beagle bitches, A No. 1 on rabbits; none better. Address JOSH W. GROSS, 119 Market street, Harrisburg, Pa. oct15,1t

FOREST AND STREAM.

A WEEKLY JOURNAL OF THE ROD AND GUN.

TERMS, $4 A YEAR. 10 CTS. A COPY. SIX MONTHS, $2.

NEW YORK, OCTOBER 22, 1885.

VOL. XXV.—No. 13. NOS. 39 & 40 PARK ROW, NEW YORK.

CORRESPONDENCE.

THE FOREST AND STREAM is the recognized medium of entertainment, instruction and information between American sportsmen. Communications upon the subjects to which its pages are devoted are respectfully invited. Anonymous communications will not be regarded. No name will be published except with writer's consent. The Editors are not responsible for the views of correspondents.

ADVERTISEMENTS.

Only advertisements of an approved character inserted. Inside pages, nonpareil type, 25 cents per line. Special rates for three, six and twelve months. Reading notices $1.00 per line. Eight words to the line, twelve lines to one inch. Advertisements should be sent in by the Saturday previous to issue in which they are to be inserted.

Transient advertisements must invariably be accompanied by the money or they will not be inserted.

SUBSCRIPTIONS

May begin at any time. Subscription price, $4 per year; $2 for six months; to a club of three annual subscribers, three copies for $10; five copies for $16. Remit by registered letter, money-order, or draft, payable to the Forest and Stream Publishing Company. The paper may be obtained of newsdealers throughout the United States, Canadas and Great Britain. Newsdealers in the United Kingdom may order through Davies & Co., No. 1 Finch Lane, Cornhill, London. General subscription agents for Great Britain, Messrs. Sampson Low, Marston, Searles and Rivington, 188 Fleet street, London, Eng. Foreign subscription price, $5 per year; $2.50 for six months.

Address all communications,

Forest and Stream Publishing Co.

ANSWERS TO CORRESPONDENTS.

THE FOREST AND STREAM'S TRAJECTORY TEST.

THE field work of the trajectory trials having been completed, there only remains the measuring of the eighty or ninety targets, with their accompanying screens, before the figures will be ready for publishing. There will also be some weighing tests on the cartridges used, so that the data will be made entirely satisfactory as to weapons and charges. It is a matter in which the least haste makes the greatest speed, and it is with a special desire to avoid further explanation and make our report so thorough and simple that he who runs may read and understand it in every particular that full time has been taken, and no special effort made to rush into print. Mr. Sinclair is now busy working up the figures, applying the vernier measuring steel to every shot mark, and gradually getting the results of the long and expensive tests into shape for our readers.

SENATORIAL ANTLERS.

THE subservient Suffolk senator missed the antlers after all. His constituents did their best; they did nobly. That the last buck of Long Island routed out by their hounds did not fall to their guns was the shortcoming, not of the Suffolk hounders, but due entirely to the apathy of outsiders. After their repeated and ardent invitations given out to the universe to come down to Long Island and hound deer, the Suffolk county folks naturally expected that men and dogs would be on hand, supplementing the home contingent, and forming a buckshot-belching barrier by which no bewildered buck might bound. But for some inscrutable reason that part of the universe not bounded by the Atlantic Ocean and Long Island Sound, displayed a stupid indifference to this glorious dogging opportunity, and the Suffolk hunters were left to their task of extermination unaided.

They did their best. West Islip mustered forty hounders, and potted its share. Euphonious Ronkonkoma sent out its host, one hundred strong, and to every man a dog. They bagged three deer. They were about to divide these three deer among the hundred men, when some one suggested a better plan. The venison was shipped to Marion and the money proceeds were portioned out among the five score. There was not a large share for each one, but the paltry sum appeared tremendous, for it went to men who prefer ten cents made in this way to a dollar earned, and everybody went home happy. Sayville's contingent came to a less amicable settlement over its booty; the village scored nine deer. Smithtown claims to have secured a fair share; and the South Side Club corralled a number of deer in its large wire-fenced preserve.

But, after all the anticipation and effort, they did not kill the last deer. This is a disappointment all around. Especially poignant is the regret of the voters of Suffolk, and heavy is the heart of Senator Otis. It will be remembered that when the deer-hounding bill was before the Senate at Albany, last winter, Senator Otis, obedient to the behests of his enlightened Suffolk constituents, with great obstinacy stickled for an exception in favor of that county. This he secured. In return the grateful Islanders were planning to present to the Senator the antlers of the last buck of the Suffolk race. The trophy was to adorn his home—to be a perpetual reminder of this particular and most valuable public service at Albany; and to serve as a reassuring pledge between the Senator and the voters, and the Senator, reclining in his easy chair and gazing upon the antlers on the wall, could see in them the assured security of a seat in the Senate chamber to be occupied by himself in perpetuity, or so long, at least, as the sweet memory of the great deer drive of 1885 should linger in the Suffolk wilds. The public presentation of such a token of senatorial subserviency would have been an edifying spectacle in this age of the world. Let us hope that it is only postponed to another season.

DEER AND PANTHERS.

WE noted the other day the inadequacy of the bounty on panthers in this State. The reward is not sufficient to induce hunters to undertake the arduous pursuit of the beast. The panther is a constant factor in the destruction of Adirondack deer. For the sake of the deer supply the panthers should be systematically pursued and destroyed, and the bounty should be such as to encourage this.

In Vermont, a few years ago, a number of deer were put out in the mountains, and for their protection a law was passed which provided that none should be killed before November, 1880. This time has since been extended to 1890. The deer have increased and multiplied. The law has been well observed. We know of but one instance where it was violated. That was the case of the fox hunters who started a deer on Sutton Mountain, and after a long chase finally killed it. But with the new stock of deer has come a new stock of panthers, and the prospects are that the panthers will prove too much for the deer. The Vermont panther bounty is the same as that of New York, $20. This might easily be increased.

HOPE FOR FLORIDA.

THE season will soon be here when great numbers of Northern tourists will betake themselves to Florida, and a good proportion of these pleasure seekers will go armed with shotguns and rifles. The notion has been sedulously promulgated by the hotel and railroad people of that State that the peninsula is one vast preserve stocked with an inexhaustible supply of game. The average sportsman in Florida has rejoiced in the license to bang away at every animate creature, unhampered by game laws—for the State has no such statute. The result is that, notwithstanding the glowing reports in railroad circulars, in many sections of Florida game is extremely scarce. It has been cleared off from the face of the country by the continual shooting in season and out of season.

A game law was once in force, though only a for brief season. It was speedily repealed through the influence of the cattle herders in the southern and western portion of the State. These men raise cattle for the West Indies. The cattle are for the most part wretched creatures, unfit to eat until they have been transported by steamer to Havana and there fatted for the market. The Florida herders are themselves wretched creatures in their way. They are too shiftless to fatten beef for their own consumption, too lazy to cultivate the land and raise crops, and too miserly to buy canned goods—the staple food of many Floridians. They are content with hog-and-hominy and game. They capture game at all seasons and in any way they can get it. They are not squeamish; they can stomach anything in the way of deer meat—bucks half devoured by ticks and does heavy with fawn; it is all food to them, in spring, summer, autumn and winter. When the game law was on the books these people resented it. At their dictation it was rescinded. The whole State of Florida meekly yielded to their demand. Since then the game has been butchered by residents and strangers.

Now, however, there is some hope of a reformation. A game club of strong membership has been organized in Jacksonville. Suitable legislation will be secured. The change may not be wrought all of a sudden, but there is still sufficient ground for the hope that the Jacksonville sentiment may spread to other localities, and in course of time the heathenish practices now current in Flordia may be abandoned.

Meanwhile the Florida tourist, instead of making his way through the State in the role of a peripatetic game-slaughtering arsenal, might help on the cause by reforming his ways and setting an example for the residents.

INDIAN EDUCATION.

THE true way to civilize the Indians is to educate them. This is well understood by those who have made the Indian question a study, and is a truth now generally accepted by all. To be effective and to have lasting results this education must begin in early childhood and must continue until the habits of life are so far formed that the child will not revert to the customs of his race, but will continue in the path in which his steps have been directed by the teachings of the white man.

Indian children, when early removed from association with the dwellers in the camps, readily adapt themselves to their changed surroundings. They enjoy life as well as ever, keep themselves clean, wear the garb of civilization, and in general act after the manner of ordinary children. They are quick to learn, and take an interest in their work which is quite up to if not beyond that of the average white child. In fact, except for their color, no one would know that they belonged to a different race from ours.

Experience has shown that under favorable conditions the Indian is the equal of the average white man in many of the ordinary pursuits of life. One of the bravest, most intelligent and most learned officers of the army whom we have known, was an Indian, *pur sang*. And instances are not wanting in which Indians have attained a high measure of success in many walks of life.

It is quite certain that with a white man's training the Indian will make a good citizen. But in order that this may be brought about it is important that the child should be separated very early in life from its uncivilized surroundings and be brought up among the whites. Since this is the case and is generally acknowledged, it seems strange that so little is being done to fit the Indian children of to-day for future citizenship. There are two or three good schools, like the ones at Hampton and Carlisle, but, except at these, the work of educating the young is but imperfectly performed. At many of the agencies there are schools, but they are small, short of funds, and unable to carry on the work on the large scale which the urgency of the case demands. The education of these children should be carried on in such a way that a majority instead of only a very small fraction should receive the benefits of it. More money is needed for this purpose. Every agency should have a school large enough to accommodate all the children on the reservation. Other schools like those at Hampton and Carlisle should be established in the East. The children of the Indians should be educated in spite of themselves, if necessary. But those children are willing to receive the benefits of instruction, and not only they but their parents appreciate that on their education depends the future of the race.

We may neglect this now. We may save a few millions of dollars to the United States Treasury in the next few years by a parsimonious treatment of this question, but in the years to come it will cost us dear. On the one hand, if we take the course which is clearly the one pointed out by duty and wisdom, we will educate these children—all of them that we can get hold of—and twenty years hence we will have added two or three hundred thousand to the number of our best class of citizens. If we pursue the niggardly policy at present in practice we will still have then as now, two or three hundred thousand savage and semi-savage "wards," who will be a constant source of expense to the Government and of trouble and uneasiness to their neighbors.

THE PRINCE OF WALES AS A VULPICIDE.—The Prince of Wales has been hunting in Hungary with Count Karolyi, and between them they shot seven foxes. We should be much pleased to learn what the esteemed *Illustrated Sporting and Dramatic News* thinks of that.

PRIVATE FISHCULTURE.

THE Ragged Lake Club, which is composed of gentlemen from Syracuse, N. Y., and which has its abode on the lake from which it takes its name, in Franklin county, N. Y., sixteen miles from Malone, have taken a step which should be followed by all persons and clubs having fishing privileges in the Adirondacks. They propose to build a little hatchery at small expense, and apply to the New York Fish Commission for eggs, and keep their lake stocked with a view to future sport. The cost will be small, but the results may be great. The example of Mr. A. R. Fuller, in stocking Meacham Lake at his own expense and reaping his reward in good fishing, after the waters in his neighborhood were exhausted, is deserving of imitation. The Ragged Lake Club, of which Mr. A. C. Belden is president, Hon. James Geddes vice-president, and Mr. Geo. Hier secretary, have begun something that will no doubt be followed by other clubs and individuals, and the day when a man thinks he has done a grand thing in slaying a large number of trout will be followed by an era when it will be considered grander to have planted thousands of fry. The fact that waters can be exhausted has been forced through many a skull that at first supposed there was no end to the number of fish. After planting will come care in capture, and the day of the trout hog will be past in waters under such intelligent supervision as will come from the practice of hatching and stocking waters by private individuals. The establishment of a State hatchery in the Adirondacks will favor this, for eggs can be readily procured there by persons interested in stocking waters, provided they put in a few inexpensive troughs.

BEHOLD HOW BLESSED A THING IS CHARITY.—A communication recently published in the FOREST AND STREAM concluded (in the manuscript) with these words, relating to a correspondent whom the author was at the time replying to: "In conclusion I would like to say something which concerns me personally. There are some things which I can never contemplate for an instant with other than feelings of fear; and one of them is that, possibly, by the requirements of old age, poverty and sin, all creeping on at one and the same time, I may be forced ever to remain in a country where writers like Mr. ——, of ——, are by law allowed such an unrestricted use of pen and ink." We wrote back to our correspondent that if he were ever fortunate enough to meet the gentleman he was so incensed against, he would probably set him down as just the sort of a fellow to go fishing with.

A BOYHOOD NOTION.—Our correspondent "Special" tells a very suggestive story of how in his boyhood days a companion forfeited the confidence and respect of his fellows because he was a game thief. They scorned a boy who could not be honest when alone in the woods. That is all well enough for boyhood, which, as we all know, has its peculiar fancies and superstitions; but such a notion is outgrown by the time man's estate is reached. No such foolishness is to be tolerated among persons of mature years. As a matter of fact, a man—no matter of what standing in the community—may go into the woods in the close season, kill deer and leave them to rot, jig trout, and commit all manner of offenses according to his fancy, and may then come home again and hold his head up, and go his way with the respect and trust of his associates.

ANOTHER PERIL OF ANGLING was illustrated the other day in the sad experience of a young Norwegian gentleman of Boston, a Mr. Frank Cardozo. Having returned from a fishing excursion, and being in all probability unacquainted with the Boston way of telling fish stories, Mr. Cardozo resented the elastic statements of a companion, Mr. Counaro, about the size of the fish that had been caught—or, probably lost—and was thereupon very properly rebuked by Mr. Counaro, who employed for emphasis an empty beer mug. The latest reports from the hospital are to the effect that Mr. Cardozo is in a fair way to recover, and he will doubtless leave his cot a more charitable and wiser angler, with sense enough to swallow the next fish story without question.

STATE AND COUNTY FAIR COMMITTEES may wisely take notice of the interest manifested in the dog exhibits where such shows have been a part of fair displays this year. At Philadelphia, notwithstanding the bad management, the dogs were the chief order of attraction; and the visitors to the Stafford, Conn., fair manifested a similar interest. It will not be very many years before the dog show will be a regular feature of the average fair. That will be a happy time for the dogs, but a day of doom for the curs, for when a community is educated to an appreciation of good canine stock it will cease to harbor the sheep-killing brutes that infest in hordes so many localities.

IN ADIRONDACK style it is not all of hounding to hound. Not by a long shot. To hound is only a part of it. The rest is to row up to the deer in the water and pour buckshot into it at four feet range, or to club it to death at arm's length. That is Adirondack style.

A "HEALTHY SPECIMEN" of an officer of the law is the deputy sheriff of Richardson county, Nebraska, who has put in his time this year shooting pinnated grouse out of season. Nothing less than a moral regeneration can save the callow broods in that county.

INDIANS AT WORK.

I.—IN THE FIELDS.

STANDING in front of the stockade one bright September morning I watched the Indians as they passed to and fro. One was bringing his horse to the blacksmith's shop to be shod, and another wanted a new bolt for his wagon. Several were driving their teams toward the mountains, and one wagon, loaded with wood, had just come down, and its driver had gone into the house to see if he could sell his load to the agent. The oats had all been cut and the yellow agency field was dotted with shocks which were ready to be hauled to the threshing machine. A cog had broken in some part of its gearing, and the agency blacksmith was hard at work mending it, while a dozen Indians and white men stood around and watched his every movement. Indians with their wagons arranged with great racks and with four very little ponies harnessed to them, stood about ready to begin to haul the oats as soon as the thresher should be ready to work.

Seated in rows against the wall of the stockade, enjoying the warm sun, sat a dozen old men who gossiped with one another without intermission. About the wagons a dozen boys, several of whom wore the garb of civilization, chased each other and scuffled together, after the fashion of boys, civilized or savage, the world over.

The scene was picturesque and peaceful. I saw a wide valley with bluffs rising in terraces one after another till the brown expanse met the sky, the bright green of the willows and cottonwoods that marked the course of the stream, to the west the mountains whose clear-cut outlines were sharply defined against the blue, the rough stockade near at hand, and further off up and down the creek the conical white lodges of the Piegans, and here and there a low cabin, built by the more advanced of them. The Indians passing to and fro, sometimes on foot or again on horseback, with their bright colored blankets, beaded belts and knife sheaths, gave life and color to the picture, which was one not soon to be forgotten.

The Piegans have shown under Major Allen's management a remarkable disposition to work. This no doubt arises in part from their natural intelligence and from the terrible suffering which they underwent during the famine winter, but it is in large measure due to the admirable way in which they are handled and to the encouragement which is given them by Major Allen. In the spring, when the work of getting in the crops was in progress, the men showed themselves very willing to work, and although, through ignorance, their efforts were at first somewhat clumsy and ill-directed, and they easily became discouraged, they soon learned to give efficient help. Now in the fall, when the crop was cut and the thrashing machine was in operation, almost all the work was done by the Indians. They loaded the teams, hauled the grain to the thrasher, helped to feed it, pitched away the straw, and measured and removed the grain. Only one white man was at work at the machine. That portion of the work about which the Indians appeared to use the least judgment was the hauling. They would pile on a wagon an enormous load of oats—far too much to be hauled out over the rough field—and then whip up the little runts of ponies, which would perhaps tug it along until the front wheels dropped down into one of the irrigating ditches by which the area is traversed, and there they would remain until the load was pitched off, or another pair or two of horses were attached to the wagon to pull it out.

It was interesting and encouraging to see the Indians at work, and to note the energy and earnestness with which they went at their tasks. Except at harvest time there is employment for very few, but some of them have garden patches of their own which they cultivate and on which they raised last summer excellent oats, and potatoes which would be sure to take a prize at any agricultural fair here in the East. They are very ignorant on farming matters, and their lack of experience causes them to act in an extremely improvident way. For example, as soon as their potatoes, or some of them, are large enough to eat, they proceed to dig them and carry them off to sell, although if left in the ground the tubers would perhaps continue to increase in size for a month longer. In this way they lose a portion of their crop. There are a hundred similar practical matters in which they need instruction and advice. Quite a number of theses Indians have, as has been stated, wagons, and when not otherwise occupied they drive up to the mountains, twenty miles distant, and haul down loads of wood, which they either sell or stack for their own use. Many of them have built comfortable log cabins which they inhabit in winter, but during the warm weather they prefer—and very naturally—to live in their lodges, which they can move about from place to place.

Except their ponies, with which, however, they are not very well provided, they have no domestic animals besides the dog.

II.—AT SCHOOL.

For a number of years the importance of educating the young Indians has been more and more appreciated. Those who are interested in the subject of Indian civilization have come to realize that in many cases it is quite hopeless to expect that the adult Indians will labor, or indeed contribute much of anything toward their own support. They see that it is only by wholly separating the Indian child from its natural surroundings—from its parents, its home and its blanketed playmates—and bringing it up as a white child—with instructors open or covert on every hand—can it be taught to carry itself as the white child does. The system has not been long enough in operation to have its success thoroughly demonstrated, but enough has been done to show that the Indian child has capabilities which are quite up to those of the average white child, and to promise great things for the Indian race when the practice of educating the children shall have become universal. Down in the Indian Territory, where this plan has been for some time in operation, it is not uncommon to find in white men's stores Indian clerks, whose services are quite as valuable as those of a white man would be. And it has been demonstrated there and elsewhere, that give to the Indian the same advantages that the white man has, and he will not fall far behind the latter in the struggle for existence.

At the Piegan agency there is a school where the Indian children receive instruction, though, owing to lack of funds and consequent want of proper accommodations, it is on a much smaller scale than we could wish were the case. Still the school had during the month of August an average attendance of seventy-four scholars. Of these, about one-fourth are in the boarding school. The rest are day scholars, that is the blanket children, who come from the lodges and camps in the neighborhood, more, perhaps, for the purpose of getting the bread that is issued to the school children at noon than with any idea of acquiring knowledge. The boarding school children are quite different from these. To see them, cleanly and neatly clad, sitting at their desks busy over their book, one might imagine that he had stepped into a New England district school house, except that in few school houses would one find so much earnest attention to duty, and so little disposition to turn away from the task in hand.

The school has only been in operation one year; that is, it was opened last October, and in this short time the children, who before knew nothing but the Piegan tongue, have learned to read very nicely and to write in English. The most remarkable and most interesting feature of the school was the very great interest which the boys and girls took in their work. They seemed to realize that the important business in hand was the accomplishment of their tasks. There was no whispering or attempt at skylarking among the boys, no giggling among the girls, all were interested and absorbed in what was before them. I could see that this earnestness was due in a great measure to the admirable methods of Miss Allen, their instructress, of whom they seemed very fond. It is their love for her which leads them to strive so earnestly to accomplish the tasks which she sets them. The older Indians, too, give the school every encouragement, and those whose children belong to it are very proud of their accomplishments, and use every means in their power to spur the children on to exertion, and to induce them to make the most of the advantages which they have. It is not long since old Running Crane, one of the chiefs of the tribe, made an address to the children, in which he said that they now had a great opportunity to learn things that their fathers never knew; that they ought to try to study very hard and learn quickly; that they must not play in school—the time to do that was when they were out of doors; but that while they were here they should give their attention wholly to their work. I heard a number of the children read, and, after the school was dismissed, which was done most decorously, I had an opportunity of examining their copy books, and of hearing something about them from Miss Allen. From what she told me and from what I saw I could not help thinking that the perceptions of these Indian children are quite as quick as those of the average white child of the same age. It would certainly surprise me to find a white child who after eleven months' instruction could read and write as well as these. Miss Allen related to me a number of touching instances of the desire to please her exhibited by the children, and indeed the influence which she had over them was very remarkable.

Later, in company with Mr. Bartlett, I went through the living portion of the boarding school. Like the school house it was built of logs, and was low, but warm and comfortable and exquisitely neat. It contains, however, only four or five rooms—a dormitory for girls, one for boys, a kitchen and a room for Mr. and Mrs. Bartlett. The latter informed me that, although it was at first difficult to teach the little girls how to cook, wash and so on, they very soon caught the idea, and when they had done so their work was admirable. Certainly their bread and the butter which they had churned was equal to anything I have ever tasted. A few cows are kept for the use of the school, and the butter which the young girls make finds a ready sale at fifty cents per pound, thus adding something to the scanty funds at the disposal of the school. More money is greatly needed, and above all, more room; for the school ought to be large enough to accommodate all the children of the Piegan tribe.

While the girls attend to the housework, a certain portion of the boys' time out of school is occupied in work in the garden. This is a marvel for this part of the country, and speaks volumes for the rich soil of Northern Montana as well as for the industry of the Indian boys who have cultivated it. For all the work, except the plowing, has been done by the schoolboys. It is several acres in extent, and all vegetables except corn, for which the climate is too cold, were growing in the greatest profusion and luxuriance. There were potatoes, turnips, beets, peas, lettuce, parsnips,

parsley, carrots and celery; enough probably to last the school through the year.

That same afternoon I went again to the school and heard the children sing. They did it wonderfully well, and there was to me something pathetic beyond the power of words to express in their singing of one or two patriotic songs. Why should they sing so enthusiastically for the Red, White and Blue, which has robbed them of their land and of their subsistence, and made them paupers, living on its charity and tenants on sufferance of so small a portion of the country that was once all their own. To think of what has been and what is seemed to me inexpressibly sad. Yo.

The Sportsman Tourist.

THE OLD HEMLOCK BUCK.

I WAS preparing for my fall deer hunt to Michigan when a voice at the door announced the visit of a son of St. Crispin, who in a very quiet way expressed a desire to accompany me. That I was surprised at this request you may be well assured, as Van had cobbled boots and shoes for me many years, and in all these days I had never heard him mention dog, gun nor hunting. even. When the spring flight of pigeons came and every man or boy who could muster a gun was out, Van was pounding away at his last all the same. If he indulged in pigeon pot pie at such times it was purchased at the expense of his hard-earned shillings, or the gift of some neighbor.

It was agreed that Van should be companion on the trip, in case he took care not to fire off his gun at the first moving object in the brush and shoot a man in place of the expected wilder animal. There was no danger of this, he thought; unless he got lost he could always hunt in the opposite direction. The day of departure (10th of November) came and the son of Crispin put in his appearance, and not badly for a green one did he look either.

He stood five feet seven and a half inches in his boots, a hundred and fifty pounds in weight, and erect and very supple for one of his calling. His scull cap was of gray cloth with ear tabs tied over the crown, a brown home made wawmus covered a flannel shirt of like material, with a broad collar turned over all; pantaloons to suit, tied close to the ankles; over these a pair of heavy knit stockings, all held in place by a pair of India rubber shoes, to which a pair of canvas leggins were attached, buttoning up to the knees. A thirty-to-the-pound double-barrel rifle, with powder horn and bullet pouch that looked as though they had seen "continental days," together with sheath knife and hatchet the worse for wear, completed the outfit. We were rather taken aback by this unexpected and complete rig for the work intended, but Van moved around as though it was his every day costume.

Nov. 14 found us in camp on Goodwin Creek in Tuscola county, Michigan. This part of the country at that time was almost an undisturbed forest; for only a few clearings at intervals of miles dotted the newly blazed roads. The remainder of it was known only to the surveyor, lumberman, hunter and Indian. Tuscola and Sanilac counties abounded with game. Elk, bear and wolves were very abundant, while deer ranged the county in numbers equal to any other forest region. Goodwin Creek, a tributary of the Cass River, with its varied timber, undergrowth, rolling lands and impenetrable swamps of black ash and hemlock, made it the best of feeding and shelter grounds for forest animals; and in consequence it had long been a favorite hunting range for the few acquainted with its natural advantages.

The lowlands bordering on the creek for several miles varied in width from thirty to sixty rods, were covered in part with low growth of hazel, black alder and aspen, alternated here and there by small bits of water partially overgrown with flags, buttonball and rose bushes. The high banks on either side of the creek bottom rose abruptly to the height of forty or fifty feet and opened on to rolling lands covered with the heaviest of beech, oak, pine and hemlock timber. Such was the hunting ground of this little river. Even from the imperfect description given the hunter who believes in fair work with the deer can picture here a paradise.

The day of our arrival a heavy snow was falling. This cleared off at night, so the morning was bound to see everything in our favor. Early at the right time we were off up the creek. At its fork it was decided that Van should take the left branch while I was to hunt the right. If nothing prevented we were to meet before night at the lumber camp on the big dam of the right fork. We had separated at the forks; before following the creek half a mile I crossed the fresh tracks of two deer. Soon they were so near I could see the snow fall from the bushes as they passed along on a walk. Sure, I must have one of them soon. I will take my time and see how they work. If they continue to head up the creek I will make a turn to head them off. In a short time they struck into a dense thicket, from whence they diverged, left the bank of the stream and struck off into the heavy timber. While slowly following and pondering what line to take something strange caught my eye. "Gracious! What's this that's stepped in ahead of me? A man's foot, and no mistaking." Then stooping down to examine I recognized the imprint of a rubber shoe with a spread-eagle mark on the sole. "Van's track, sure. What's he doing on my side of the creek? He must be lost and in his bewilderment has stumbled on to my deer." I was suddenly startled from this reverie by the clear crack of a rifle not many rods away. Hurrying up, I soon ran afoul of the lost one, scurrying around with his knife out and punching two deer that lay kicking on the ground. "Hello! Van, what you doing here on my side, killing my deer?" "Oh, I'm the fellow that kills two deer at a shot!" was the only reply. Not another word was exchanged, so we helped clean the deer—a barren doe and picked-up fawn—and drag them home.

After refreshments Van unfolded himself. He said that "after leaving me at the forks he allowed I had got the best of the layout, so he concluded to go well round to my right, hunt beyond me in that direction, and I would never be the wiser for it at night." It was on the way round he came across my game, and followed for a short distance, when he spied them standing in a fallen treetop. He saw but the doe when he fired, and was much surprised to find the other deer kicking out its life by her side. The doe was shot through the shoulders, the fawn through the neck just back of the ear. They were standing ten feet apart.

At noon the sun came out bright enough to blind the wildest deer running, so we agreed to go to a hemlock swamp half a mile from camp and look up an old "Golden" that was well known to several hunters. He was invariably found in or about the swamp, had been fired at often, and though always wounded he got away. But what was most wonderful of all the many stories regarding this supposed mythical animal, it was gravely said that "he had a third horn growing out of the center of his forehead."

We had barely passed along twenty rods of the border of the swamp, than a deer showed a portion of his body in the dense underbrush not as many feet off. We could follow his route by the snow he shook from the brush in passing. As he was making directly to the far side on the west, we struck a fast run to head him off as he might emerge from the thicket. We soon struck a lumber road that skirted the swamp on that side, and had not proceeded far before we saw coming the largest deer on record. At first we thought it an elk, but before we had time to think he had passed behind a large fallen pine tree that led to the road we were following. Van was a few feet in front. As soon as he saw the deer occasionally showing its antlers above the log as it walked slowly along, he motioned his hand behind him, remarked in low voice, "I see the deer," and raised his gun to fire. Now is my time sure, thought I, he will miss, the deer will jump to the road and stop to look into the cause of the commotion, and so give me a clean open shot. Van fired, but the deer did not jump. He fell just where he stood in his tracks. A thirty-to-the-pound ball had severed the spine. It was a clean calculated shot. There was eighteen inches of snow on the log, the ball passed through it where it touched the moss. Had the aim been two inches higher my turn would have come next. As it was, I was my third deer out that day, and before 2 P. M. too. The deer was soon hung up and cleaned. We guessed the weight all the way up to 200 pounds, although he was thin even unto starvation. There was not a single ounce of tallow on him, not even about the kidneys. His paunch contained about half a bushel of hemlock twigs and leaves. He was a hoary, scragged, gray-haired old fellow with a spike horn eight inches long in addition to the regular antlers growing nearly from the center of the forehead. There was an old ball wound through the neck; another had glanced along the left shoulder, making a rough skin wound. He was the veritable "old hemlock buck." We had killed the mythical animal.

Although the buck was worthless as food, it was decided to take him home as a sight worth showing. So I went in search of a lumber team and Van went to try his hand on deer. It was long after dark before I had the big deer in camp. Van was there already, toasting his toes and frying venison. He merely remarked, as I hove in view, "Doctor, now as you've got your hand in at hauling, s'pose you follow that lumber road, from where you have brought this deer, about a mile further to the north and you'll find another hanging up in plain sight; and not to be mean, I will go along and help." "The other" was brought in that night, and well it was so, for before morning it commenced raining with a meaning and kept it up all the next day, and drizzled the day following, froze that night, and so went on day after day for nearly a week, when we so despaired of ever seeing another good hunting day that season, packed up game and traps and left for home. Van gave me the hemlock buck and barren doe. The first weighed 170 pounds dressed; the doe was fat as a squab pigeon, and was considered the best piece of venison I ever brought home. Van never took advantage of his position, though he often told of how he killed two deer at one shot, and I never denied it. My old friend died a few years after this. I have since heard that he was a noted deer hunter in the "parts he came from in Northern New York."

Judge Caton, in his book on "North American Cervidæ," states that a third antler has only been found in the elk, wapiti (*Cervus canadensis*). I send to the museum of FOREST AND STREAM the antlers of the "old hemlock buck," killed Nov. 15, 1856, near Poowin Creek, Tuscola county, Mich., to be identified as a deer's head with a third prong or antler.

CLEVELAND, Ohio. DR. E. STERLING.

DR. E. STERLING.

THE following notes from the Cleveland *Voice* give some welcome information about an individual whose signature is very well and pleasantly known to the readers of FOREST AND STREAM:

"Elisha Sterling was born in Salisbury, Conn., Aug. 15, 1820. Nine months later the family moved to New Haven, where they resided till 1824, and then emigrated to Cleveland, by the way of the Erie Canal to Buffalo, thence by lake on the steamer Enterprise. The Doctor says they 'found the city a hamlet of five hundred quiet people.' Mr. Sterling, Sr., went to practicing law with the late George Willey's uncle. The only other practitioner at the bar at the time was Governor Wood. 'Lish' was foremost in all boyish athletics, and had more than his share of mishaps—breaking each leg, at different times, and being once pushed into the canal lock (where he was nearly drowned) by a youngster with whom he quarreled over a string of bullpouts. In such sports as swimming, climbing, foot-racing, wrestling, shooting, fishing and archery, he was proficient. At the proper age Elisha began the study of medicine, and in due time was graduated an M. D. He was then sent to Paris for a course of study. His favorite book had been, he tells us, the life of 'Blue Beard.' 'When it was first proposed to send me to the center of learning, over the sea, my first thought was to visit the abode of Gilles de Retz, on the banks of the Loire. A book found in the National Library, entitled "Voyage Pittoresque et Romanesque dans l'Ancient France," was just what I was after—an immense folio with text and illustrations of all the remarkable chateaus of France. Blue Beard's was among the number. The result of it was that with the first vacation of August, 1848, I could have been seen, staff in hand, on a grand chateau hunt. During this and succeeding vacations twenty-five hundred miles were traveled over.' An episode of his Paris life was an invitation from Ricard to accompany him upon a professional visit to President Louis Napoleon to operate for a stricture of the urethra—a disease the Emperor died of in exile, in 1873. In the fall of 1852 Dr. Sterling formally established himself in Cleveland as a physician and surgeon. The largest fees he ever received were: operating for the stone, $2,000; and $1,000 for plastic operation on the face. His smallest fee was half a penny, 'taken from Artemus Ward, for carrying him through a genuine case of Maumee fever and ague.' The Doctor made the first operation on the Western continent for excision of the hip-joint from gun shot wounds, Aug. 20, 1861. 'The Army Medical and Surgical Record' credits him with the priority. Dr. Blackman, of Cincinnati, claims the honor; but his date is given as ten days later. Dr. Sterling's patient survived eleven years, while Dr. Blackman's only lived four hours, as we are informed. Dr. Sterling has a letter from Dr. Baird, of the Smithsonian Institution, accrediting him with being the first to make plaster casts of fishes. His enthusiastic love for everything connected with pisciculture is well known. A pleasant evidence of it is the Castalia trout stream, which now furnishes unbounded pleasure to several fishing clubs. The Kirtland Society of Natural Science was the result of a suggestion by the Doctor. The first meeting for its organization was held in his office, Feb. 25, 1869, as the record book will show."

MY FIRST DEER.

THERE are some things one never forgets. The killing of his first deer marks an epoch in a man's life, and if you will listen I shall not be very tedious. I will tell you how I killed mine.

Late in the year 1853 I had reached the mature age of eleven. With a hereditary fondness for natural history and field sports I was eager to be the possessor of a gun. My gentle mother was a widow and I her eldest child. Though born and bred in the far South, where the use of arms is part of a youth's education, she had all a fond mother's anxiety for her children's safety, and whenever I asked for a gun I was told that I would probably kill myself instantly if such an instrument were put into my hands, and that I must wait until I had reached maturer years before my desire could be gratified. My mother was the owner of a very large and well equipped plantation situated in one of the riparian counties of Mississippi and but a few miles from the great river from which the State takes its name. It was her custom when in the United States—for though she lived in Louisiana she was much abroad—to pay a visit in the autumn of each year to this plantation, upon which her bachelor brother resided as her representative and where he maintained the most charming of bachelors' establishments, and I was usually taken along. At the rear of the place there was a horseshoe shaped lake (an old cut-off of the river), full of fish, that in the late autumn and winter months was the resort of myriads of water fowl. Not very far from the plantation mansion, or "great house," as the residence of the master was called, the neighboring gentlemen had built a double log cabin, in which there resided a curious character.

Dennis had served four terms of enlistment in the U. S. Army, and a former company officer who lived near us after leaving the service had taken the old fellow up and built him the cabin mentioned, fitted it up, and the veteran pensioner was passing his last days in great comfort. Like many of his countrymen, old Dennis (though the most faithful of soldiers, and the greatest possible stickler for discipline) had one weakness, viz.: a strong penchant for Kentucky whisky. He had three distinct stages of inebriation. In the first he was very military and conservative, and feared that the introduction of percussion-lock muskets into the service had sapped the warlike spirit of the nation. In his second he was apt to be didactic; and in the third he was rather fond of alluding to his own personal exploits while in the service. He had been First Sergeant in the Company of the Fourth U. S. Infantry while the regiment was in Mexico, and, judging from the conversation he had had with Gens. Taylor and Scott and other officers of high rank, which he used to repeat to two or three of us, the war would never have ended so triumphantly for the American arms but for Dennis's suggestions and advice. Among this old worthy's belongings was an ancient musket of the pattern of 1812, three-banded, with an enormous flintlock. In the veteran's third stage of maudlin inebriety he would point to the ancient weapon as it hung on hickory forks above his cabin door, and with apostrophic gesture tell us of the wonderful fatality that attended its use in the various skirmishes and battles "with thim Mixikins."

As a neighboring lad and I walked slowly homeward after listening to the old sergeant's marvels of slaughter, we used very soberly to wonder that any Mexicans were left after one of these Homeric encounters. As I listened to these stories and gazed at the wonderful instrument of death one day, a wild thought came into my mind. The tremendous possibilities it awakened startled me. I would buy that musket. As I said, the possibilities dazzled me. To own such a death-dealing instrument, one which had accomplished such results—why, it would be too much good fortune for one person to hope for in this world. But the idea grew. I would become the proprietor of the wondrous weapon if money could accomplish it. One day after the old soldier's potations had been of uncommon strength, I delicately broached the momentous question. He looked at me with a glance in which wonder and dignity were blended, and burst into copious tears; but I persevered. Finally he said that if I could produce the sum of two dollars and a half, why, as a great favor, the musket should be mine. Now, I had two gold dollars, and I knew that in any great emergency my uncle could be relied upon for the other half dollar. To make my story short, I got the needed fifty cents, and with my other dollars in my pocket and a beating heart in my breast, I went to old Dennis's cabin to conduct the operation and take possession of the property. He explained the mysteries of loading and priming, and putting in a new flint, he gave me the coveted weapon. I dared not take it home, and

what should I do with the thing now that I had it? Where could I put it? My colored factotum Sam (a typical negro boy of the old time whose mother was my faithful nurse, and a better one there never was) suggested that it be hidden in the hollow of a big sycamore tree, about half a mile from home, until the next Saturday. On Saturdays I had a holiday, and so was not obliged to study. My private tutor who was something of a musician was in the habit of visiting a near neighbor, to whose young daughters he was imparting the rudiments of a musical education, and so I usually had the day to myself.

The next holiday was a beautiful one, just such divine days as sometimes come in the late far South autumns. With a large vial filled with powder, abstracted stealthily from my uncle's abundant powder flask, and a lot of shot of various sizes, from No. 1 buck to No. 6, I proceeded to get out the hidden gun. It had suffered no damage in its concealment, and I loaded it as well as I could, remembering to follow the advice I had received from its late proprietor, using plentiful paper as wadding. Then Sam and I went down toward the lake I have mentioned to shoot at something. A large tree had been blown down by a summer storm, and had fallen with part of its top in the water. Behind this trunk I sat down, with the gun barrel resting across it, and was ready to destroy anything feathered or furred that came in range. We sat there, I should think, an hour. A flock of mallards fresh from northern prairies and lakes sailed slowly up and down, and finally dropped into the water about a hundred yards away, and began preening themselves after their long flight. I waited for them to swim in closer to shore and give them a shot, but they unaccountably, as it seemed, "declined to oblige." Finally, as I was getting tired of so long a stillness, and was thinking of leaving, I heard my boy Sam say, "Jes look dar, Marse Hugh!" I looked, and the sight nearly made me speechless.

Six deer were coming down out of the canebrake, and heading directly for the place we were concealed in. At the head of the column there marched a stately buck, with as fine a head of horns as one could wish to see. Behind him were two does and three younger deer. I hardly dared to breathe. On they came until they were within twenty yards of where we lay hidden. The buck, as became a monarch and gentleman, headed his seraglio and children to the water's edge, where he bent his stately head and took a long draught of the silvery water. A young doe behind him nibbled daintily—with the coquetry of a *grande dame*—at the sweet autumn grass that the water had kept green. The soft lustrous brown eyes of the wild things shone like those of a beautiful woman. I was face to face with God's loveliest children in their most charming mood. The buck looked on as a patriarch might watch the sports of giddy youth, while the younger deer bit at each other in simulated anger or dipped their tawny nostrils and dappled faces in the limpid water. All at once I saw a quick change in the leader. He suspected danger. The wind blew strongly from him to me, but with some instinctive warning he knew his followers were in the way of harm. He reared his branched head and gave a low tremulous whistle. In a second the beautiful creatures were alive with the instinct of self-preservation. But what was it? Who had seen the slayer man whom they had reason to fear since Nimrod the Mighty Hunter. In the intentness with which I watched them I forgot that I had a gun.

"Fo' mussy's sake, Marse Hugh, why don't yo' shoot?" I heard my African lieutenant whisper in a voice of agony. Tremulous I somehow pulled back the massive flint-bearing hammer until with a loud "tchick" it was at full cock. The buck detected a movement. He started to run, but in some invisible way gave orders that the others should go first. He would cover the retreat as became a hero and warrior patriarch, heading his own family. He stepped off about forty yards and stopped. I tried to sight him, but my eyes filled with water and the front sight looked as big as a barrel. In desperation I wildly pulled the trigger and the ponderous hammer came down. The gun had snapped. If that buck had only gone then. He started at the click of the falling hammer and ran about twenty yards, and then, as if in defiant bravado, deliberately walked back toward me, followed timidly by the others. They too, wanted to see what that gray looking thing behind the log was. In a second my nerve returned. I was as calm and steady as though I sat in my mother's big rocking chair. I pushed back the tumbler that covered the pan and again cocked the gun. Taking as good aim as I could I pulled the trigger the second time.

I have since then lain in front of forty heavy pieces of artillery in hot action and helped handle a battery of 13-inch mortars, but never did I hear such a roar! The musket recoiled terribly, for I must have had in it five drams of quick burning powder. The heavy cock caught me on the lip as the musket leaped backward and knocked out two of my teeth. It hit Sam, who was looking over my shoulder, directly on the nose, reducing that organ—too flat for beauty in its normal condition—to a degree of flatness that feature seldom attains, and he always averred that it kicked him four times after it got him on the ground, but of that I had my doubts. I wanted to cry but dared not, while Sam, whom no degree of pride restrained, bellowed like a yearling bull. After we washed our faces and repaired damages as well as we could it occurred to me to look for my deer. Poor fellow; there he was! The charge had gone high, but very close, and broken his back. He could stand upon his fore legs, but never more would he leap or run again. For a moment I would have given anything in the world to have had that deer unhurt and full of life as he had been so little a while ago. The wound was deeper than I thought, for in a moment more he rolled over, his lungs filled with blood and he fell limp and lifeless—dead. With his death came a revulsion of feeling. The hunting instinct at a hunting race blazed up. I forgot my bruised mouth and missing teeth. I had killed a deer!

Well, I went home, walking on air, and told my story. The deer was brought in and hung up on the lower limbs of a great oak. My uncle, who was delighted at the exploit, said that if I would get the Multiplication Table so I could say it backward by Christmas he would give me a gun suited to my age and strength. By the most terrible mental effort I have ever undergone I performed the feat, and Christmas saw me the proud owner of a beautiful English shotgun, which did me but little good, for in the following summer I had to go to France to be educated. Gentle, patient reader, I have had a fair share of the world's honors—rude as they are. I have rode out in front of a crack cavalry regiment as its commander when but little more than a boy, but never, never have I known that supreme ecstacy that comes from achievement to such a degree as I did when I showed my gentle mother and kind old uncle my first deer.

THE CONICAL WORM SNAKE.

In my paper of March 5 on the "Ground or Worm Snakes," allusion was made to the little "conical worm snake" of India (*Gongylophis conicus*), at present an inmate of our London Zoological Gardens. I was then anticipating the brighter skies of summer to enable me to observe it while feeding, Tyrrell, our head keeper at the Reptilium, having reported to me its habit of constricting its prey. Now we have always associated the idea of constrictors—those which kill their prey by constricting or crushing it in their coils—with the larger serpents, boa, python, anaconda, and a few others, and not at all with the small burrowing snakes, many of which approach the lizard in structure. This conical worm snake, therefore, was a subject of great interest to me, more especially so because our principal European authorities make no mention of its habits, which indeed Dr. Günther, in his "Reptiles of British India," affirms to be but little known.

Feeding time—once a week at the Reptilium—commences with the sunset bell; consequently a bright, clear evening and the willingness of *Gongylophis* to partake of his supper without loss of a moment of the precious twilight were matters of anxious desire. Promptly came the obliging keeper to the worm snake's cage first; in it were also several other small snakes, including the pretty little *Heterodon nasicus* from Kansas, presented by Dr. Garman, of Cambridge, Mass. I may here repeat that this conical worm snake keeps itself continually hidden under the gravelly shingle that covers the floor of its cage. Just its nose and the top of its head, no bigger than one of the pebbles, which in color it resembles, may be discerned by a practiced eye, and there it remains motionless hour after hour. Unless from this habit of hiding itself, I don't know why it is called a "worm snake," as it is a true ophidian and in no way related to the others of that name, or at all resembling a worm.

But fast waning daylight makes us impatient, even in imagination, and we eagerly watch Tyrrell and the shingle as five little white mice are dropped into the cage. Instantly one was seized by a *Coronella cana* and coiled so swiftly that the eye could not follow the movements. This little coluber, then, is also a constrictor; and while noting with some relief that the poor little mouse was instantaneously killed, not a limb quivering to betray any suffering—hey, presto! the pebbles flew, and like a jack in the box springing to light, *Gongylophis* was on the surface with a mouse almost hidden in his coils also! Thus, motionless, the snake remained for nearly five minutes, when, without loosening its hold, it began to examine its victim. Finding the head and deliberately getting that between its jaws, it proceeded to swallow the mouse, which operation occupied only a few minutes. Sparing a glance for the *Coronella cana* I saw that while still tightly coiling the first mouse, it had caught and was eating a second. Presently, in process of deglutition the coils necessarily slackening, a viperine snake coolly secured the dead mouse and, undisturbed, devoured the same. Meanwhile *Gongylophis*, after partaking of his mouse, worked his way stealthily under the gravel, causing just so slight a commotion on the surface as to enable one to trace his route to a further corner, where his head reappeared and where he remained watching mouse the fourth. This little quadruped, however, espied those treacherous eyes, and giving a spring to the middle of the cage, ran up the stem of a shrub and settled himself among the branches, calmly surveying the scene below, and apparently having "quite a good time" in his security. Any of the snakes could have easily followed him had they been so minded, but in their pre-occupation mousey gained courage, and presently dropping down among them again, sat on its hind legs to wash its face and make itself generally comfortable. During these few minutes *Gongylophis* made a slow excursion round the cage, thus enabling us to see his entire length and coloring as he stole up to mouse the fifth, caught and constricted it for exactly four minutes. With the vanishing twilight this second mouse disappeared down his captor's throat, obscurity then terminating that evening's observations and leaving one of the five mice still at its toilet.

This Indian "worm snake" is a sad glutton, sometimes surfeiting himself disgracefully. On one occasion, when his sole companion was a green *Paperita* just arrived, the keeper, to tempt the new comer, put four mice into the cage, all of which were caught and swallowed by *Gongylophis* before his comrade could seize one. The consequences of this gluttony next day can be imagined; nor was the inconvenience confined to himself, because his loss of appetite for some succeeding days frustrated my next week's observations.

That he is a true constrictor, however, admits of no doubt; and we find a reason for this in the fact that in structure he is very similar to the boas, to which he is related. But while his relatives who climb trees possess a long, prehensile tail, his has diminished to an inch and a half, and is stout and of a conical shape. Living under ground a prehensile tail would be useless. It is from this peculiarly short, pointed tail that *Gongylophis* derives his specific name *conicus*, and not from the head, as I at first supposed, that being also of a conical form and the only part of the little "worm snake" that I had then seen. It is one of the family of sand snakes (*Erycidæ*), and so closely related to *Eryx* that Duméril calls it *Eryx conicus*, or *L'Eryx à queue conique*. Its average length is somewhat over two feet; in color it is chiefly brown, prettily marked with black down its back; the ventral scales are white. In some species rudimentary hind limbs are slightly distinguishable in the form of very faint prominences or stylets on each side, near the base of the tail. This is another feature which these very small ground snakes (*Eryx* and *Gongylophis*) possess in common with the gigantic constrictors, tree boas and the anaconda (a water snake), affording an interesting example of certain inherited distinctions which have been preserved alike in individuals which in other respects have widely diverged from the ancestral type.

Though so different from Mr. Horsford's worm or ground snake, which was the starting point of these investigations, *Gongylophis* has extended our acquaintance with the constricting snakes, which we find to include not a few of the smaller snakes. *Coronella cana*, the hoary snake, from South Africa, is a constrictor, coiling and retaining its prey until dead; so is the lacertine snake, *Cœlopeltis lacertina*, but this latter being the subject of recent investigations claims a few words to itself in due time. Several of the smaller snakes, which, in structure, are not true constrictors, nevertheless use the coils of their body to assist them in holding and managing unwieldy prey, though not to kill it. I have seen a *Heterodon* and an English ring snake do this in dealing with a bulky or troublesome frog, while the true burrowers, or the lizard snakes, depend solely on the grasp of their jaws, and swallow their food by a succession of quick snaps, as the limbed lizards do.

May we not hope to hear that further observations have been made this summer on the habits of the American worm snakes, and the result of those promised investigations of Mr. Horsford's little worm snake that "ran under ground" so nimbly?

Catherine C. Hopley.

HABITS OF CRAYFISH.

Of our fresh-water animals, none possess more interest to an observer than the common crayfishes. I say common because in most parts they are rare or not found at all. They dart about in our streams and pools and play around the water in a most interesting manner. I have sat on the shady banks of a pretty stream near Washington for hours and watched these little creatures as they busied themselves about their work, and my interest never flagged, for I was always learning something new about their habits. They are very pugnacious and will fight, kill and eat each other if they get the chance; but their chief food consists of succulent roots and waste matter in the stream.

When the eggs are laid the female catches them as they are deposited, on her swimmerets, beneath the tail, and to these hairy appendages the eggs stick by a gluey secretion. Upon these they are held by the female until they are hatched, and even then the newly-formed and imperfectly-developed young, by a strange instinct are led to remain attached to the female for a few days. It is interesting to watch the animal in this stage. The young gradually develop the power of swimming and begin to wander a short distance from their birthplace as their power increases. Whenever danger is apprehended the tiny things fly precipitately back to their mother. Gradually they venture further, until at last they leave their parent for good to seek their fortune in the small stream, and perhaps to be eaten by the very mother who so carefully protected them in their earlier days.

The old crayfish as they swim about present a peculiar appearance as, carrying their large claws clumsily in front of them, they slowly walk forward, or suddenly dart backward by quick flaps of the tail. How often have I stood on the banks of the stream and watched them go through their motions. Turn over a stone and when the mud clears you will see crouched away in the darkest corner one of these animals looking up at you with its stalked eyes. Place your hand suddenly in the water and he is gone like a flash, and you see him rapidly making his way down the stream. An easy method of catching these creatures is to place a little net just behind them, and then to frighten them. They will almost invariably dart backward into the net.

In distribution they are very curious, for in certain large areas in this country they are entirely absent, and in one stream they may be abundant, while in another adjacent to it not one can be found. There are many different kinds, all differing in some minor technical point. All east of the Rockies are of one genus, and west of those mountains the other genus, *Astacus*, is found. In New England there are none, except in a river in the north of Maine, where one kind is found. That such a large area should be uninhabited by these animals, while the much less favorable place, the Mammoth Cave, has a peculiar blind kind of its own, is certainly remarkable. On the banks of the Mississippi there is a burrowing species which does great damage by digging holes in the levees. In Virginia there are at least three kinds, the large edible river species, the burrowing kind and the brook species. The latter inhabits nearly every little stream flowing into the Potomac, and is almost invariably present in the springs at the head of the stream. Every Virginia planter protects these little creatures when found in the springs, "for they purify the water," he says, and with good reason.

There is one species which I have had especial opportunity for observing and which is, without doubt, the most interesting one of the whole group inhabiting the United States. This is the burrowing crayfish, technically called *Cambarus diogenes*. It was found in a meadow near Washington, living in abundance in burrows in the ground at a considerable distance from the stream. No one has published anything upon the subject, except the naturalist Girard many years ago, and my observations differ somewhat from his.

In this meadow, which in winter is covered with water, the holes are found in great numbers, and each is covered by a chimney or mound made of pellets of mud. At the end of a burrow, which varies from six inches to three feet, according to circumstances, is a bottle-shaped cavity in which the crayfish lives. The bottom of the hole contains about a pint of muddy water, from which the crayfish must get its oxygen for breathing. The hole is sometimes not over half an inch in diameter, and is often as wide as two inches, varying with the size of the inhabitant. At the bottom of each burrow one adult animal is always found and never more.

For reasons which I shall not attempt to explain here, I am led to believe that during the winter the burrowing crayfishes retire to the water in the stream, and in the spring, finding the water decreasing in volume, that ungovernable force, called instinct, leads them to burrow in the ground primarily to escape the drouth and also to raise their young. The burrow is dug perpendicularly until water is reached, and as long as water is left in the hole, the animal is satisfied. But soon the increased heat of the summer dries up the surface water, and the crayfish is obliged to burrow deeper. In doing so more mud has then to be excavated, and this is piled in the shape of a mound or chimney around the mouth of the hole. How the creature rolls up large pellets of mud to the surface is hard to understand. But that it does push them up the smooth and regular side of the burrow, is a fact clearly shown by the evidence at hand.

What the animal lives on deep down in its burrow is difficult to see. I have never seen it out in the daytime, and as there is nothing in the hole to eat it must go out by night. There are no side burrows and no tunnelings, and never have I found two burrows united. The male and female are separated by masses of earth, and to come into communication with each other they must meet outside the burrow. I found large numbers of females with the young clinging to their swimmerets, and these must all live in the almost dry narrow burrow. How do they get a sufficient amount of oxygen? It is an intensely interesting creature and one which will bear much study. At present nothing positive is known about it and the subject is open to any student of nature.

Ralph S. Tarr.

THE NIGHTHAWK.

WE do not agree with the opinion expressed by "Curtis" in his "Notes on the Nighthawk," FOREST AND STREAM, Oct. 8, when he says "there was possibly never more of a misnomer in natural history than the name of this bird." We think that "hawk," with the limiting word "night," is a name that is quite as appropriate as hundreds of other popular names, and it is certainly much more suggestive than many vernaculars. Although the writer condemns nighthawk in his first paragraph, he goes right along using it throughout his article, occupying two-thirds of a column, nor does he suggest a substitute. It is just as well perhaps that he does not, for there is no doubt that nighthawk is the best English name we have for the bird, notwithstanding the fact that "Curtis" tells us that "its hairy head, large eyes, and rapidity of flight should have prevented its being classed with the birds of prey!"

Our ignorance may be inexcusable, but we were not aware that the nighthawk had ever been "classed with the birds of prey." As regards hairy head, large eyes and rapidity of flight we might say that the only hair on the head of the nighthawk is that constituting the rictal bristles, while many hawks have a comparatively large amount of hair among the feathers of the head; large eyes are to be found in the owls, which we believe are "classed with the birds of prey;" and rapidity of flight—need we remind "Curtis"?—is a feature for which the birds of prey are remarkable.

A little thought on the part of any one will convince him that there are characters in which the nighthawk resembles certain of the smaller rapacious birds, especially those of the family *Strigidæ*, and it will be very easy for him to account for the common name. The nighthawk is crepuscular or nocturnal in its habits, under ordinary circumstances; its mottled coloration, its barred tail and under parts, its flight, its "swoops," its long wings, its large head, and its acute vision are points on the strength of which the average person would feel justified in dubbing the possessor nighthawk.

We do not call attention to the above features to attempt to demonstrate that there is any affinity between the hawks and owls and the nighthawk, but simply to show that there is a strong superficial resemblance, which should not be overlooked when considering vernacular names. S.

WASHINGTON, Oct. 19.

Editor Forest and Stream:

In FOREST AND STREAM for July 30, 1885, Dr. E. Sterling writes he has never met with the night hawk's (*Caprimulgus virginianus*) eggs protected by stick, straw, or material of any kind whatever. I found a nest of two eggs this summer at side of small orange tree. The eggs were upon a bed of pine needles placed about the tree as mulch.

FRANK H. FULLER.

FRUITLAND, Fla.

DOG-WOLF HYBRIDS.—The Philadelphia *Press* has a note about the "Zoo's" dog-wolf hybrids recently noticed in these columns: "The three surviving members of the half-dog and half-wolf family, born at the Zoological Gardens three months ago, are showing their savage nature more every day. Yesterday afternoon keeper McCadden heard a noise in the pen in which they are kept, and in which was also a little red fox. Running to the cage he saw the three dog-wolves attacking the fox. The keeper made a rush for the cage, but before he could get in the red fox had been torn limb from limb by his vicious companions and was being eaten up. Head keeper Bryne said he had been expecting some trouble from that quarter for some time, and as the wolves grow older they exhibit a very bad disposition on account of being half-breeds.

NOTIONS ABOUT SHOOTING.

Editor Forest and Stream:

I have always been an advocate of the maxim "The best is the cheapest," but have not always been successful in finding out the best. In the autumn of 1883 I purchased a supply of powder, for which I paid $1.60 per pound; and at the same time my brother got a lot for the removing of which the storekeeper fined him the sum of 38 cents per pound. (That is the way I put it at the time.) One day he proposed that we try the relative strength of the two brands. We loaded a dozen shells from each lot with 3½ drams, 1⅛ ounces, and shot them all from the same gun at a target, distance from 25 to 45 yards, and we could tell no difference in the pattern or penetration, and the fouling of the gun was about the same. This may sound like a "barefoot-boy-with-a-pin-hook" story; but I don't care, it is correct.

I noted the strictures of one of your correspondents on hammerless gun. I admit that they have a sort of "remember-Tam-O'Shanter's-mare" look, and at first sight impress one about as favorably as an earless pig; but the man who thinks that they will decline in favor surely reckons without his host. I have many a time failed to get in my second barrel because the game jumped suddenly and I had no time to cock it; but in the hammerless both barrels are controlled by the same motion of the safety brake, and with me this advantage neutralizes any argument that can be brought against this form of gun. The exception taken by the same correspondent to the expression "hammers below line of sight when cocked" savors a little of captiousness. He might as well argue that we cannot compare the levels of lakes Maggiore and Geneva with a line drawn along the summits of the Alps; that the lakes would have to be side by side and under the Alps before the expression "below the level of their summits" would be legitimate.

I wonder why some manufacturer does not bring out a hammer gun with a safety brake. I believe it would "take."

I think "Ah-Pe" has fallen into the same error that he places at the door of a certain "gunmaker and author," that of discriminating unfairly in favor of the products of his own country. I think some of his statements are not quite justified by facts. He insinuates that any person who shoots an English or Belgian gun costing less than $50 does so at the risk of his life. Now in this country there are hundreds of such guns in use, costing all the way from $18 to $45, and I have heard of but one case of bursting of barrels, and that was the fault of the shooter. Moreover I can show two guns (side-snap and under-lever actions) that cost $22 and $24 respectively, that have seen six years' usage on our marshes and are not "shaken to pieces" by a jugful. In this vicinity guns that cost over $50 are like the proverbial angels' visits.

Again, he says that it is not worth while to go over the water for a gun, except you want "external show," and then you should patronize Purdey and some few other London makers. He also says every dollar you pay over $250 is for "external show." The gun that Purdey sends out here for $450 is plain, no engraving, and, according to "Ah-Pe," we pay him a clear profit of $200. I would rather take the profit and buy a good Birmingham gun with it. I may have a depraved taste, but I would take a Scott, Richards, Ellis or Greener hammerless before a Purdey, as the latter has gearing enough for a sawmill, and some of the forces used in operating it are a long distance from their points of application. I have nothing to say against American guns, but "Brummagem" is good enough for me. L. I. FLOWER.

NEW BRUNSWICK.

MOOSE AND DEER IN MAINE.

THE work of enforcing the Maine moose and deer protective laws is being pushed with the usual vigor. It is believed by those deeply interested that there has been less poaching the past open season than the previous year, or perhaps any season since the rigorous pursuit begun of those who shoot when the law says nay. But still everything is not yet exactly as it should be. Even gentlemen (?) sportsmen stoop to shooting deer out of season. In Richardson Pond, a few rods from Richardson Lake—one of the Androscoggin chain—could have been seen the bones, half denuded of the flesh, of two deer—were seen Sept. 25—the Maine open season begins Oct. 1. No use whatever had been made of these deer; every bone was intact. They had evidently been in the water a month or more. On this pond are the camps of two gentlemen—handsome summer cottages. These gentlemen have been in camp, with their families and friends, also a large force of guides, since early summer. They say that they have even taken their ladies out, behind the jacklight, and given them the sight of a deer; so plenty are the creatures. But they are silent upon the subject of shooting. Who killed the two deer left in the water? No outsider could have done it without the knowledge of the owners of those camps or their guides.

But there is trouble with the Indians. They have killed some deer in the northeastern part of the State, whether gentlemen have tolerated such a breach of sportsman-honesty in the western part of the State or not. A Calais paper says that Lewy Mitchell, a Passamaquoddy Indian, who can read and write, and is intelligent enough to understand the game laws, came to town the other day, on the warpath after Warden French, who had poisoned his hound found running deer near Clifford Lake. The Indian employed a lawyer, with the idea of recovering damages for the loss of his dog, which he claimed to be warranted under treaty right. But he found that there was "no property in dogs;" that the warden had done his duty; that a warrant could not be granted. The satisfaction took another turn. Warden French got a warrant for the arrest of the Indian for violation of the game laws. The case excited a great deal of interest, and able arguments were presented both for the Indian and for the prosecution. The result was the finding of the red man guilty, but the judge imposed the lightest fine under the law—$40. Against this ruling the Indian appealed, and the case will come before the April term of the Supreme Judicial Court at Calais.

Warden French has had further trouble at Clifford Lake. Indians appeared hunting deer with dogs. The warden came on the scene. The Indians took alarm and fled to the woods. Warden French found they had gone to Little Munquosh, where there were four other Indians in temporary camp. In the dead of night he started after them. He arrived at their camp at 2 A. M. Landing from his canoe before the Indians took alarm, he dropped into their midst, flashing his dark lantern. He ordered the Indians to lie down. Terror-stricken they obeyed. He then shot the poor dogs, two in number, who showed more courage than their guilty masters, attempting to bite the officer. He then entered his canoe and paddled away, telling the Indians he would attend to their case before the courts. It was a brave exploit.

The Calais *Times* finds that moose are returning to the borders of Dobsis Lake, one of their best natural breeding and feeding grounds. One weighing 900 pounds was killed there on Monday before the open season began on Thursday, with no attempt to bring it out till the proper time. Alas! for the pains those styling themselves gentlemen will take to evade a wholesome game law—a law which, under the unwilling obedience it has received, is restoring this lordly game to its natural haunts in the remote parts of the Pine Tree State. A sportsman who goes into the remote sections of Maine every fall and is not over-particular about the season remarked the other day: "Let them enforce the law the best they can. It is not half so hard to find a moose as it was two years ago. They are beginning to increase. It takes some courage to kill a moose nowadays, even just before the 1st of October!" And yet this man is not willing to obey a law he sees to be of so great value to other sportsmen. True friends of the Maine game laws who go there annually begin to feel toward those who kill out of season just as they would toward a thief who should steal game from them which they had lawfully killed in open season.

When we were boys we had our lines of mink and muskrat traps every fall. The ground was too great to be gone over each day by any one of us. We visited the traps by turns. There was true honor among the boys. Each was sure of what had fallen to his own traps. This went on for many years. At last one boy began to find too much in his traps. We stood it till we knew he was guilty of stealing, with only the silent trees and murmuring brooks as witnesses. Then we turned him out. We also failed to further set our traps while he remained in the neighborhood. We believed the skins would all fall to his clutches. All confidence in trapping was gone; a thief, against whom we had no means of defense save his own honor—this was void—was among us. We felt toward that boy just as we feel to-day toward the man who will go on to our hunting grounds—everybody's hunting grounds in open season—and kill a moose or deer contrary to law and sportsman's honesty, just because he can do so and evade the law, either through his position as a gentleman or an expert in keeping out of the way of detectives.

As showing that moose are increasing in Maine it may be mentioned that a train of cars killed one not long ago between Danforth and Forest. Also, a gentleman driving in Fredericton, met, below Nashwaak, a large bull moose which showed fight toward the horse, pawing and striking with his forward feet till frightened away by the gentleman himself. A moose also walked leisurely out into a cornfield in Kingfield one day last July. SPECIAL.

THE FOX AS A TREE CLIMBER.

Editor Forest and Stream:

I am invited by your correspondent Mr. Conway to express an opinion as to whether the fox which treed twice the same day in front of Gen. Washington's hounds was a gray or a red. It was a gray beyond the peradventure of a doubt. The red fox goes to earth always.

I possess a knowledge of the accumulated experience of three generations upon this point, which I have heard often discussed by my father and his friends. For fifty years my father kept a pack and followed them with a zeal and skill perhaps never surpassed. I have myself given many days to the sports of the field and study of the habits of game. With the lights before me I am not prepared to believe that a red fox ever took to a tree in front of the hounds. I am not to be understood as calling in question any man's veracity; but if anybody believes that he has ever seen a red fox up a tree my opinion is that he is mistaken. On the other hand, the gray fox trees habitually when pressed by hounds, and doubtless often when pressed for food.

This arboreal habit of the gray fox is, so far as my knowledge extends, entirely exceptional among the wild *Canidæ*, and is a nut for the Darwinians. Know they anything of any tree-climbing *canis* toward whose arboreal habit this proclivity of the gray fox of to-day is a reversion; and why do not reds revert also, or any modern dog whatsoever?

There is a peculiar fact of geographical distribution to be noted concerning the territory occupied by the reds and grays. The seat of my maternal ancestors was Gunston Hall, within sight of the home of General Washington, at Mt. Vernon. My father's family owned, and some of them always occupied large estates near Fairfax Court House, and my own home was in Loudoun county. My own personal observation of the habits of the fox covers, therefore, the very ground over which General Washington rode to his hounds. In my early life a red fox was seldom seen in that part of Fairfax, the grays had almost exclusive possession. In comparatively recent years the reds became tolerably numerous about Fairfax Court House, but the grays are still most numerous in that section. Twenty miles north of Fairfax Court House, where my Loudoun home was, I have never to this day seen a gray fox, nor heard of one being seen within the last thirty years, though I have hunted over every acre, I believe, within a radius of ten miles hundreds of times, and have started and killed many scores of reds.

One more fact and I will have done. The red fox produces its young invariably in an earth den. Sometimes when a den is abandoned for cause the young are temporarily deposited in the root of a hollow tree, but rarely and under exceptional circumstances. The gray fox habitually produces its young in a hollow stump or log, or in the root of a hollow tree. M. G. ELLZEY, M.D.

WASHINGTON, D. C.

IN THE BAD LANDS OF DAKOTA.

NOVEMBER had come. The beautiful cool weather was just such as to entice one to enjoy outdoor exercise. The sky clear, the sun bright, the stars countless in their splendor. The first day's travel at an end, the sheet iron stove was in full blast; just within the tent two of the boys were cleaning the prairie chickens killed along the road on our way; and soon the potatoes and the chicken and the biscuit were all before us for our first supper in camp. Then we talked of the sport in store; there was to be no uncertainties as in the East. That we would get deer we were certain.

For three days we go north, into the Bad Lands; all the way the hunting is good for birds and deer. We know we are passing hundreds of them, but our hearts are set on a certain place and we keep on for that. Our path leads along the Missouri River all the way. We have no timber in this part of Dakota except a narrow strip on each side of the river, where you will find forests of from one to five thousand acres, very thick with willow and other brush. This makes a splendid cover for deer and other game. All the deer for hundreds of miles come to the timber in the fall, when prairie fires burn over all the country and drive all game to the timber. Hats are thrown into the air as the last camping ground is reached. It is a beautiful spot on the bank of the river. Two of the boys must go out and see what the signs are. In twenty minutes the sharp report of a rifle is heard; then another, and still another; and we know we are certain of meat for supper. The boys come in, and it is only one hour from the time they left. "Hitch up," is the command. This means deer. "Well, boys, what success?" "An antelope." We start with the wagon and reach the spot without any trouble, for both deer and antelope are almost always shot out in the coolies, or up on the prairie away from the timber, where they come out to feed in the evening or morning. Antelope never go into the timber at all. We reach the spot just at the edge of the timber, and are surprised to find no antelope, but instead two large blacktail deer. A deer steak, to men who are hungry, is just about as fine a dish as one can find.

The night is so beautiful that we all gather outside the tent around a bright campfire. One old fellow, who has hunted for years in the Northwest when a white man was not certain of living one hour, as the Indian were ever after him, spins his tales of adventure and tells of the countless thousands of bullalo he had seen swimming the river at this point, years before, when the steamboat was often stopped because the river was full of them. This seemed a little large, but all the old river men will tell of the same. The buffalo is no more.

The old man is heard calling the camp to breakfast when the clock points to 4. At daybreak we must be stationed along the timber to watch for the incoming deer, which is often a beautiful sight; and when the boys open fire excitement runs high. It is not long before the clear sharp report of Will's Marlin is heard from a treetop, where he has climbed, and a lone deer is seen coming our way with that long swinging bound which they take when not very much frightened and not certain if they should leave their fallen mate. When within seventy-five yards she rears high in air, makes a few bounds and falls in answer to the call of the rifle. Now we all look at the two deer, for Will had gotten a fine buck, and start for the high ground and the deep ravines. These coolies are very narraw, deep ravines with here and there a patch of an acre or two of brush. Deer often stop in these for the day; we soon jumped two and took them on the run. By the time we had the game in camp it was noon. Then we got ready for a drive. Three of us stationed ourselves on an old road which leads one mile from the prairie into the river. Two of us went out of the timber a few miles, and riding two Indian ponies worked down slowly. The chances were good of getting good shots at retreating deer. Two were shot during the afternoon by

the drivers, while only one was killed by those on the stand. This made seven for the day. The evening is the best time for deer hunting, but the boys were tired and we were out for sport and pleasure. We sat on the bank of the river and caught some large catfish, while a few practiced with the rifle on chickens, which were to be seen by the hundreds in the treetops.

Can you imagine anything more delightful than to spend a week in this way? If you want to go home and do not wish to drive you can signal a passing boat and in a few hours you are at home. We spent a week in this way—the most delightful in my life. We trapped foxes and wildcats and other game as pastime, and at the end of the week loaded up forty-two fine deer, and had we been hunting for profit we could have doubled this number. W. H. WILLIAMSON.

BISMARCK, Dakota.

GUN—CALL—GRAMPUS.

Editor Forest and Stream:

In your issue for Oct. 1 is an addendum to "Woodcraft" which I think good and sound, though I say it as shouldn't say it. But there is a fearful balk or botch in the three sentences commencing at the eighty-third line. I don't think my MS. will show such clumsy work, and it could hardly be in the proof reading. Some clipping and bungling about the compositor business, I reckon. Anyhow, amend or burn it. If you haven't the MS. let the lines read about like this, commencing at the eighty-third line: "He would start out from camp at early dawn at a five mile gait, and tramp through the woods all day as if on a wager, while I crept about silently or kept quiet watch on the runways, scarcely traveling more than three miles in a day's hunt. He was constantly jumping deer at long range and taking chances on stern shots, by which it happened that he had a great many wounded deer to look after, while my shots were mostly at short range and the bullets tucked snugly in just abaft the foreleg. He made at least four shots to my one, etc."

And the pleasantest days have come, the best of all the year—to us of the Gulf coast—the saddest to you up there, perhaps. Mercury at 6 A. M. down to 64°. Insects—and the list of them is a long one—all gone, or nearly so. New shanty and council-log in running order. The best camp by odds I ever made, and the pleasantest. It is to be headquarters for the next six months, and one can afford to take pains with his home. The council-log is of Spanish cedar, and just trims with a crew of five. There is a little hatchet sticking in each end of the log, not for the benefit of tourists and canoeists, but I shall have a good many visitors at the camp-fire this coming winter, and it is likely some of them will be fishermen.

I have the turkey call in practice. You ought to hear me. The first time I tried it I stampeded an old gobbler who nearly broke his neck getting away. But I improve on it. I lie in camp nights practicing for hours; and you can't hire a young darky to go past the camp after sundown. It is also excellent for stampeding the half wild pigs that come about the camp at night to root and steal. And I think with a few weeks' practice I can attain to the inveiglement of a turkey, a half-grown one, say.

I send a sliver from the council log and trust you will not accuse me of putting on airs because I have a finer residence and surroundings than most woodsmen and outers. It is not that, but red cedar is fine fragrant wood, and it is likewise distasteful to most insects and reptiles. Sitting on such a log you are less likely to rise up and grab frantically at your trousers on the chance of crushing the industrious scorpion that is hidden therein. I did that a few Sundays agone. And this week I caught it on the port ear. It was about like a bee sting or hardly as severe. But I am a little shy of the deadly grampus.

My respects to "Meat-Hawk." Am not conversant with the Nirris and Abors. But if he will spend a few days in my camp I will convince him I am rather cleanly in personal habits and I can cook something which he can eat. Let him read "Woodcraft" more carefully. NESSMUK.

TARPON SPRINGS, Fla., Oct. 8.

ON BUZZARD'S BAY.

MONDAY morning bright and early we went on board the Minnie, a cat-rigged craft, Capt. Albert Dunlap, with guns, fishing tackle and provisions for a week. The last four days had been cold and rainy, but now the sun was out as bright as a new silver dollar. When we left, as the clock was striking seven, there was very little wind and things looked as though we we were sure to have a fair day; but before we got to Black Rock, seven miles down the bay, it was blowing a gale, so good-bye to fishing. We ran around inside of Jacob's Neck, hove over the mud hook, got the oil stove going, had the coffee hot, fried salt pork in which to fry our quahogs, got out the hard bread; and some of your readers can guess how it tasted to a man who had not been on the water for a year.

After dinner the covers came off the guns, and getting into the skiff we pulled for a creek which makes into the island for about a mile. You can judge of our surprise when after tramping the shores and marshes for two hours we had only one yellowleg and two ringnecks. We found our old enemies the mosquitoes here, and I stand ready to match West Island against any place in New England for mosquitoes, both for size and ferocity. Tired out we went on board and had supper. Capt. Dunlap got in both barrels at a crane, but missed at forty yards, when I gave him an ounce and a quarter of No. 8 shot and brought him down.

Tuesday it rained all day, but we went off to a lone rock and caught some tautog and one scup; but as the wind was beginning to blow quite fresh again we ran in shore and anchored. Then I taught the captain to make an Irish stew.

Wednesday morning we went ashore and tramped around the island about five miles, but got never a feather. We left the island about 10 o'clock and ran to the south and west of Black Rock, where we caught fifty pounds of tautog, the largest being one of five pounds; and at 2 o'clock we started for a beat to windward of ten miles, arriving at the wharf at half-past 4 o'clock.

Take it all around we had a good time in spite of the very bad weather. I shall always remember that trip; there were no birds, no good weather, "no nothing" but mosquitoes, but the lively captain kept me from having the blues, as he always does for his passengers. Will some one tell us why we did not find more birds, or were we too late in the season? West Island has always been a good place for them.

OLD PARD.

FITCHBURG, Mass., Oct. 12.

MICHIGAN'S SHAME.

Editor Forest and Stream:

I have just returned from a trip up the line, over the Menominee mineral range. As the season for killing deer is now open, every train brings in from six to twenty hunters. I stopped at Crystal Falls for one week. The deer brought into the village averaged twenty-five saddles per day. Only the saddles are brought in, for the local buyers refuse to buy anything else; and outside hunters find it very inconvenient to ship whole carcasses in barrels, so they ship only saddles. Every express train carries boxes and barrels of venison marked "Cranberries, handle with care." So, notwithstanding we have a non-export law, the slaughter still goes on. Local buyers pay the small price of four and five cents per pound for saddles and hides. In summer the hide hunter kills only for hides. As the open season approaches the deer butchers can see visions of dollars ahead that he cannot get during the hide-gathering season.

I saw every day does brought in, their udders distended with milk; many of them in the velvet. One load of eight had been killed so long that the carcasses were rotten, and the buyers refused them. The deer butcher, one Clark, simply jerked off the hides and dumped the saddles into the river. Such is an every-day occurrence. This Clark was accompanied on this trip by a professional gentleman from Cleveland, O. My only regret is that any one of high social standing should stoop low enough to accompany such a brute in the woods.

The law is a dead letter without the game wardens to protect the game. The season of three months is too long. One month is enough and more at the present rate of killing. Escanaba and Marquette are at present the greatest shipping points. Fish cars are filled, hauled aboard of steamers, marked "Fish," and are made on every steamer. No one stops them nor tries. In lumber camps hunters supply deer at $1.50 to $2 per head, reserving hides.

The trout law is also openly held to be a dead letter. Not a week passes but that large shipments are made. In winter they are easily caught under the dams with nets. When frozen they are packed in pork barrels and shipped as pork.

One trader on Pike River, Wis., bought and shipped during the winter of 1883–84 eighty-five thousand pounds of venison. In September I saw fifteen pairs of saddles at a trader's, being packed to ship. This was during the close season in Wisconsin; so Michigan is not alone in the non-enforcement of her laws. Snow fell at Crystal Falls on the 2d, and now the deer are rutting and are easily killed in the night with a headlight, although the law prohibits it. Several men have been shot within the last year, two cases fatally, besides numerous horses and cattle. S. E. B.

MENOMINEE, Mich., Oct. 10, 1885.

BOB WHITE—QUAIL—PARTRIDGE.

Editor Forest and Stream:

"Wells" reappears once more and comes up—well, I was going to say "smiling," in his difference with "Coahoma"—but from the tenor of his article I hardly think that is the correct word. It grieves me to witness their heat. I would that they could reconcile their differences and dwell together in unity. "Wells" says Bob White, "Coahoma" says partridge. Which is it to be? There should be unanimity, for we have been told that "a house divided against itself cannot stand," wherefore have a care that you be not disconcerted in the tumble. "Wells" says the bird has been called partridge in the South for fifty years; and therefore he says it is "our bird." Will he permit me to add to his information on the subject by telling him that the bird has been called quail at the North for more than that length of time, wherefore residents of the North might call him "our bird" also; but they don't wish to monopolize a good thing. They will share with their Southern brethren, who may also call him quail. Supposing, as "Wells" says, that the people of New England do call the ruffed grouse "partridge," I know of no one who justifies it. No one who calls ruffed grouse "partridge" or "pheasant" complains of "Wells" when he calls quail "Bob White." He is on the wrong scent. He says "the partridge of Europe more nearly resembles Bob White than he does the ruffed grouse." Well, then, why does he not call it partridge instead of Bob White? He also says, "if we will use Bob White the error will be avoided." But there isn't any error. "Wells" has simply forgotten the facts, and I hope he will refresh his memory. He says, "there is no authority anywhere, except the lowest usage, for giving 'our bird' the name of quail." Um! Let me read that again. Well, after due consideration, I think if I had used such language I should say I was sorry and wouldn't do so any more. And I might say, as he has said of Bob White, "the quail is not Bob White, and all the scribblers on earth cannot make him so;" but I wouldn't for anything.

"Coahoma" says that Northern men brought the innovation (quail) down there and now some "dudey" sportsmen affect the name. Score one for the "dudeys;" I have hopes of them yet. I fully believe both "Coahoma" and "Wells" when they solemnly assert that they never, never will call the bird "quail," and I assure them that it will be entirely satisfactory to me. We agree to disagree, that is all. I claim, first, that the bird in question has been called quail as long as, and perhaps longer than, anything else in this country; second, that he has some points, at least in resemblance, to his European congener; third, there is nothing derogatory in the name quail; and fourth, that American quail is the most proper, the most dignified name. Scientific sportsmen use it, the FOREST AND STREAM and other sportsmen's journals use it, and American quail I doubt not it will be long after "Coahoma" and "Wells" have passed over to the majority with S.

Editor Forest and Stream:

It is said by very high authority that the names partridge and quail are applied to more than twenty different species, and of more than one genus. Even in New England the application varies within short distances. At the South, however, "partridge" has been universally applied to the *Ortyx virginiana*, and to no other bird. No one ever heard the word "quail" applied at the South to Bob White until after the war. The average darky or poor white man would not know what you were talking about if you called Bob White a "quail." But in the discussion of this question by the several correspondents of FOREST AND STREAM it seems to be clear that there is an irreconcilable diversity of opinion as to what this favorite bird should be called. The judgment is governed entirely by early association and education and the locality where the several disputants were reared. In other words, the matter depends upon the question whether a man has been raised on "pork and beans" or "bacon and greens." If on the former, then he will "guess" that quail is the proper appellation; but if on the latter, he "reckons" that partridge is correct. One correspondent, under the *nom de plume* of "S.," with singular and unparalleled intolerance sneers at the idea that any other name than quail is proper; while "Wells," with far more wit and elegance, combats this view, and in my opinion, with a great show of reason, is steeled against the application of the word "quail" to his beloved Bob White.

Partridge is certainly more dignified and euphonious than quail. And how much more beautiful and musical is "welcome partridge," the name applied to one of the species, than it would be if the word quail be substituted for partridge. It is bad enough to use the monosyllable as a substantive in this connection, but when it is coined into a verb, as has been done by some of your correspondents, it becomes insufferable. When a man writes that he "went quailing" the expression not merely argues of ignorance, but is lowering to the dignity of Bob White. Indeed if the name of this gentle bird is to be changed I would suggest to "Wells" that he should not be curtailed of any part of the name suggested by his love call, but let him be called "Ah Bob White." The only possible danger which could arise from the adoption of this name would be the propensity of some wag to drop the surname, and call him "Ah Bob."

But to return to the main question. In order to ascertain the correct name we must, as in all similar cases, inquire of those who are acknowledged as authority on the subject. Beyond question the great weight of authority establishes that partridge is the proper term to apply to the *Ortyx virginiana*. Dr. Bachman calls the bird a partridge. Dr. Coues states that it is the "Virginia partridge," also called quail, Bob White. He styles the other varieties Florida partridge, California partridge, etc. But our highest authority is Audubon. That charming and accomplished naturalist calls it "the common American partridge," and says: "The common name given to this bird in the Eastern and Middle districts is that of quail, but in the Western and Southern States the more appropriate appellation of partridge is bestowed upon it." AH BOB.

NEBRASKA GAME NOTES.

QUAIL are more plentiful here this season than I have known them for a great many years. I found one nest, near the house, that contained twenty eggs, and every one of them was hatched by the old bird. Another old bird within twenty rods of the first was caught off a nest of twenty eggs. One bird nested in a pile of wood thirty steps from our door and hatched sixteen out of nineteen eggs. Several cats are about the house, too, but didn't find the nest.

Prairie chickens hatched well, but "sportsmen" from town have been shooting them ever since the last of July. The deputy sheriff of this county has several times been seen hunting them before they were one-half grown. One member of the Gun Club of Falls City (and perhaps more) shot chickens before the law was off. They will have to keep it up only a few more years, till prairie chickens will be gone from this part of the country.

Some wild geese and sandhill crane were seen going south last week. They do not come down this way as they did ten and fifteen years ago. At that time settlements were not so numerous on the Platte and there was not so much feed up there for them, then they came down the Missouri by hundreds.

I have not killed a goose since February, 1884, when I bagged three in one day with a .40-90 rifle, with bullets weighing 220 grains. I have been using 370-grain bullets and found the trajectory was so high that it was hard to hit a goose over 150 yards, guessed distance, on a sandbar. I then got a new pair of moulds and got game with the light bullets much oftener than with the heavy ones. I heard geese in the morning on the bar, and started with thirty shells in my belt, and I missed a few shots before I got my first goose of the day. Some of the shots were not more than 200 yards and the geese flew. I then fired for another gang which I saw, and at the third shot killed the one at which I aimed at 345 yards. The next one I aimed at was at 275 yards, at the second shot, and the last one was 300 yards, fourth shot. All the shots were off-hand. I shot some shots flying and several at longer distances, some as far as 600 yards, and shot twice at a duck, and came home without a loaded shell, but feeling well satisfied with my little hunt.

SALEM, Neb.

PHILADELPHIA NOTES.

LAST Thursday a large flight of ruddy ducks, called stifftails by our local gunners here, reached the waters of the Delaware River; and many were killed quite near the city. Howell's Cove, below Gloucester, N. J., was full of them; and fatigued by their migration, were easily paddled on and shot over. It seems a pity that this pretty little duck should have been shot in such numbers before they had recovered from their fatiguing flight; as they were in wretched order, as are all the ducks which the late storm brought to us. A great many big yellowlegs were shot just before the gale on the New Jersey Atlantic salt meadows and our market is full of them. Some brant have reached Tuckerton Bay. Six were killed there by a local gunner last week, but they were mere frames with skin and feathers drawn over them. A few wild geese have also appeared, one or two also having been brought to bag in the same section in like terrible order.

The redheads which will reach the New Jersey bays will show themselves in Barnegat Bay first and appear in Tuckerton Bay a week later. Whistlers and bluebills are already very plentiful there. Rail shooting on the Delaware River is about over. A few very fat birds remain, too lazy to start south. The next cold snap will hurry them; besides, there is little left of the reed seed to supply their wants. "Quite some snipe," as a professional remarked to the writer, have dropped into the meadows round about Philadelphia within the last week. In fact, the late storm brought many migratory birds to us, and fairly good shooting may be expected for those who consider the quail season opens too soon by a fortnight, and who will remain here and devote the time to the migratory specimens that have lately come. The woods and thickets are yet in full leaf; the quail will be hard to find and very hard to kill when found in such cover. The birds are yet small, and two more weeks' grace given them will add much to their gameness on the wing and certainly better condition for the table. HOMO.

PHILADELPHIA, Oct. 17.

WITH THE BEARS.

Editor Forest and Stream:

In a recent short sketch of bear hunting I promised to let your readers hear from the big hunt. The parties who were to meet me with hounds and guns for an all-day hunt after bruin, failed to keep their promise. I took my horse and rode up the river, having sent word to the darky who keeps my dogs to go ahead with them. On arriving at the place of rendezvous we found only two men and three dogs, and as the sun was peeping above the treetops, it was then time to go in with the dogs, for the bears generally leave the drives after early morning, and return to the "Big Swamp."

Off we go on foot straight for the bear grounds, two miles away. It is quite cool, and the air and bushes are heavy with dampness, and the clouds promise more still. I divest myself of my coat, and throwing my gun over one shoulder and my horn over the other, I start with them, knowing that although chilly now I shall be "hot in the collar" before bruin is intercepted. I have been all the morning debating in my mind the question whether to take my repeating .38-cal., or my 28-inch, 12-bore shotgun, finally deciding in favor of the shotgun on account of the thick undergrowth, and the utter unlikelihood of getting a shot at short range.

After going about half a mile the dogs begin sniffing the air and bushes, but we call them in and place them behind us. Soon after, the leader of the party, the Veteran, calls attention to an indentation in the hard, dry road, and remarks, "That looks like a bear track." Almost at the same instant old Bounce, our old "strike" dog, opens with a roar, followed by Crowder and Jump in full chorus. We at once recognize the bear bark of old Bounce, and knowing that bruin is out of his latitude we make for the low grounds or bay glade to cut him off. After a good long run we arrive at the glade, and all out of breath stop to listen. In the distance, a mile or more away, we hear the baying of the dogs, away to the right, but circling in our direction. About this time we are joined by a "fifteenth amendment" with his muzzleloader, and we string out about fifty yards apart, the dogs in the meanwhile coming rapidly in the direction of our stand, the tenor of Jump mingling with the deep bass of Bounce and Crowder. The Veteran strikes off for a point further up into the swamp, while I, out of breath, saunter slowly along, keeping abreast of the dogs as they veer a little in the direction of the big swamp. They are coming now full tilt, straight for us, and our hearts are thumping heavily from the excitement and long run. The dogs are not more than a hundred yards away when I see the darky cock his gun and begin creeping along in my direction, peering into the bushes at the same time, as though he hears something. My gun is also at full cock now, for I too hear the rustle and crack of bushes and twigs as some heavy body moves rapidly in my direction, whether cattle or bear I can't at the time tell, so dense is the undergrowth. I have but few seconds to wait, for with a rush out bounds the bear, and as he strikes the path I down him with my right, and as he rises I get in my left, and down he goes again, but is up and in the bushes once more, before I could say Jack Robinson. Immediately the dogs are at the spot, and putting them back they go only a short distance and begin baying. "He is down," cried the Veteran, and in he rushes with me close at his heels, but the dogs are again moving, and I am entangled in the bamboo briers so that I can move hand or foot only as I cut my way out; so I make my way back to the path, but just before I reach it a gun fires and the dogs hush, I know the meat is safe. One of the party crawls in under the briers and gives the bear his quietus by placing a load of buckshot in his brain. By this time quite a party have arrived, hearing the noise so plainly from the shore, and we have a full pack of dogs. We now go in and bring the bear out to the paths and look for my shots. They are found instantly. A ball and three buckshot in the left shoulder, penetrating the lungs, and twelve buckshot, my last load, in his flank. Still he dragged himself more than two hundred yards before giving in. He was a fine fellow, weighing a little over two hundred pounds, and very fat.

It being still very early, and a large force of fresh dogs and men having arrived, we proposed another drive, and the proposition meeting approval, we directed two of the party to take the dogs up the paths, while we would station ourselves about a mile above in another drive. Having reached our stands we waited patiently for more than an hour, but heard nothing of dogs or men. The wind having risen, we concluded the dogs had started and gone down wind, so we returned to where the bear was killed, and after getting there listened for the dogs. We soon heard Monroe's voice away to the east of us, in another drive, and pretty soon the report of a gun sounded in the direction of the dogs, followed by the toot of a horn. We immediately started in that direction, and after going about a mile met some of the boys bearing a fine deer swinging from a pole resting on the shoulders of two of the party. It seems that the dogs had started a large bear almost immediately after getting into the second drive, and he departed for parts unknown at a two-minute gait, getting away from the boys and going in a direction opposite our stands, the high winds preventing our hearing them. The boys, or a few of them, had gone in that direction and were trying to blow the dogs off. Monroe had quit, and on his return struck the trail of a deer and immediately began working it. He soon jumped, and the deer ran straight to Smith, the darky who keeps Monroe. Smith having a very good muzzleloader, cut short the chase by putting a ball through the deer's head. As the rain had now begun to fall and noon had nearly arrived, we concluded to give over for the day, thinking we had done well enough.

The boys went again yesterday, but I have heard nothing from them. We will join forces again next week, and if anything occurs worth relating will let you hear from me.

A. F. R.

ADIRONDACK DEER AND HOUNDS.

Editor Forest and Stream:

The law prohibiting the hounding of deer was the crowning act for the preservation of the deer in the Adirondacks. If the game law has been as strictly enforced in all parts of the wilderness as it has been in this section, at least 2,000 deer have been saved that would have been slaughtered had the law remained as last year. Now that there is no chance under the law for the slaughter of deer, sportsmen, hotel keepers, guides and all interested in the preservation of deer in the Beaver River country have taken measures to enforce the law in respect to deer. A competent man has been hired and deputized by the State game constable to give him authority, and has been on duty since the 10th of July. Several arrests have been made for killing deer before the first of August. So well has he succeeded that not the sound of a dog in pursuit of deer has been heard in all the Beaver River country. He has proved to be the right man in the right place, he is everywhere and turns up where least expected. He should be a candidate for State game constable the first opportunity. Mr. Moyer is a thorough woodsman and familiar with all parts of the ninth game district, and is much interested in the preservation of deer. He is paid by private contributions from persons interested in the preservation of deer. At the close of the season I will send you the names of the contributors with the amount contributed.

A few days since I chanced to meet a guide just in from the Fulton chain of lakes and made inquiries about how the law was being observed in that section. He reported that the law in respect to hounding deer has been violated all along that chain of lakes. "Where is the game constable?" I asked. "O, he is at home; he kinder seems to let um drive," he replied.

Delinquent game constables should be removed and their places taken by those more interested and who would attend strictly to the enforcement of the law; there are plenty such to be found.

What an agreeable contrast from last year at this time. Then, go where you would in this great sacred temple "not made with hands," you would hear the voice of the hound in swift pursuit of the frightened deer and hear the rapid reports of guns on every lake and stream in the hands of pretended sportsmen and pot-hunters engaged in the work of murder and extermination. Now silence reigns supreme, the deer wanders undisturbed in his native haunts and shows himself in gratitude along the silent stream and quiet lake and around the borders of the settlement, where a year ago he was a stranger unless forced there by the hound on his track, which ended in his destruction. So glorious is the contrast that it does not seem possible that the people of the State of New York will become so lost to all sense of humanity as to again sanction by law this brutal mode of hunting.

MUSSET.

NUMBER FOUR, Adirondacks, Oct. 17.

THE SPORTSMAN'S REVERIE.

O NATURE, Mother Nature, thou
Another bible art, and ever
Wilt teach as thou hast taught till now,
And bloom with God, to perish never.
Dear Mother Nature, at thy shrine
I lay this tribute, it is thine.

The huge log crackles in the grate,
And reverie steals gently o'er him,
As reminiscent thoughts create
Landscape and incident before him.
Backward his heart and glance are cast;
He lives again within the past.

It is the hush of the gray dawn—
He hears within its reedy cover
The mallard splashing; now 'tis gone.
From off the sand a strong-wing'd plover
Rises and circles high in air,
And wakes the plaintive echoes there.

'Tis sunset; low along the grass
He crouches, with his spaniel near him,
And marks the wildfowl as they pass.
The leader swings; they yet may clear him.
A right and left; they scatter high;
Two of their number fall and die.

He whips the pool with skillful wrist—
The pool that sleeps within the valley.
He strikes; with many a dash and twist,
The wily trout meets every sally.
The stubborn fight at last is o'er;
It glistens on the pebbled shore.

Reclined within the fragrant shade,
He lists to Bob White's liquid yodle,
Which sweet and mellow to the glade
Floats inward from the yellow stubble;
And all the border of the wold
Is dark beneath and tipped with gold.

The forest aisles he treads again—
The forest dim and old and solemn;
A Presence in the dale and glen
A spell diffuses to enthrall him—
A Presence never seen yet felt—
And meekly he in spirit knelt.

Within the hollow of his arm
Neglected lies his trusty rifle;
Subdued before this higher charm,
The hunter instinct does he stifle.
'Twere sacrilege indeed to wake
The frightened echoes from the brake.

Listen! The bay of the swift hound
Comes ringing down the deep recesses;
The spell is shattered at the sound.
In graceful speed the quarry presses;
A sharp report—before his eyes
In death the antlered monarch lies.

Sunset again; the lake a sheet
Of burnished, massy gold is shining,
And where the sky and water meet
The quivering sun is fast declining.
In hues which words and thoughts defy,
The painted clouds range up the sky.

Along the lake, along the shore,
The twilight falls, a blessing bringing;
Homeward with measured stroke of oar,
All dreamily he passes, singing;
In softer tones the well-loved strain
In echo voices comes again.

Unto a mighty silver shield
The placid lake its surface changes,
As the full moon o'er flood and field
Illumes the sky and lower ranges;
And angel eyes in heaven above
Kindle the stars to looks of love.

The last spark flickers in the grate,
The snow without is madly whirling;
He lights his pipe to recreate
The vision, through the smoke wreaths curling;
But visions do not come at call,
And he must bid good night to all.

THOMAS F. WATSON.

A PROPOSED BEAR CLUB.

Editor Forest and Stream:

I have just returned from a hunting trip through Oxford county, Me. We found the bears very numerous, the farmers are losing many valuable sheep, some have decided to sell their entire flock this fall on that account. While staying at my brother's (S. M. Locke, postmaster in the town of Roxbury) several sheep were killed, one came to the barn with its side torn open, severing three ribs, opening into the stomach, besides a savage blow on the shoulder and wounds upon the back and neck. Mr. L. has lost a large number of sheep, and had he not waged a vigorous war on the bears with trap, he would have been driven from the field. He has taken thirty bears, the last one in June, weighing 360 pounds; sheep bones were found in his stomach. In one month he took seven bears. The traps were set on one-half acre of land under oak trees. Mr. L. said the noise the bears made (three were in at two different times) "was hair-raising even to an old trapper." The amount of damage to the farming interests of Maine by bears, such as the killing of sheep, damaging fruit trees and discouraging the farmers from engaging in growing wool, is considerable. Why cannot those rifles, now useless since the buffalo is gone, be used to equal advantage in killing these pests? They will furnish tenfold more enjoyment for each individual than could be got out of the buffalo. But we must have good bear dogs to hunt them with, and as there are no dogs in Maine worth anything for the purpose, such dogs must be brought from the South, where they have been used successfully.

The sport will pay well, for, instead of 75 cents for skins, they would be worth from $10 to $20, and that, together with a $5 bounty, and meat and oil thrown in, is quite an item. And then there are no swamps of deadly malaria to destroy one's health, but the clear cold air of these fir and spruce-clad heights, with innumerable sparkling streams, and the soft carpet of downy snow, enabling the hunter to bring the dogs along the trail until the bear is started, thus dispensing with the "test dog," and almost doing away with the tracking dogs. Who will volunteer to form a club to purchase dogs and engage in the hunt? Several persons of the right stuff, say a half dozen or even less, would be able to combine and have some royal sport. I have written parties in the South to purchase dogs for such a purpose. Let me hear from those interested in the subject as early as possible, that we may have a hunt this fall and early winter. I take this opportunity to extend cordial thanks to the brother sportsmen who have so kindly responded to my call for information about the use of dogs in hunting bears. May I indulge the hope that we shall hear from them often and that others will contribute on this subject, so interesting to many of the readers of the FOREST AND STREAM?

BRUIN.

The early snow fall on the summit of Pine Creek Mountains has started the bears down to the lower levels. The miners will have bear steaks and bearskin caps or overcoats or the bears will have lodgings furnished for the winter in the tunnels and prospect holes. Bears have increased greatly in numbers in this State since the great wind storm of January, 1880, which threw down so much timber and rendered the woods almost impassable in some parts of the State and preventing the hunting of bears with dogs. In some parts of Southern Oregon "the woods are full of 'em." A gentleman who has lately been out to Coos county says there are more bears than hogs in that county.—*Oregonian.*

IT WOULD HAVE DELIGHTED THE SOUL OF AN ADIRONDACK CLUBBER.—Honesdale, Oct. 18. Since the hunting season opened in this State a number of deer have been killed in that part of Pike county woods through which the Honesdale Branch of the Erie Railway runs, between Hawley and Lackawaxen, in Pike County. S. D. Van Akin, telegraph operator at Lackawaxen, is a great deer hunter. A few days ago he went into the woods a mile west of the station to hunt for a large buck that had been seen in that vicinity. While he was driving the ridge with his dog an enormous five-prong buck came out of the woods on the other side of the valley, dashed across the Delaware and Hudson Canal, through a field, across the Lackawaxen River at a deep place called the Whirlpool, and, climbing the railroad bank, crossed the track and entered the woods where Van Akin was hunting. Before it came within his range the buck got wind of the hunter and his dog, and bounded back out of the woods to the railroad track. At that moment a coal train, on its way east, was approaching the spot, and the deer sprang out only a few feet ahead of the locomotive. The buck kept to the track and ran on toward Lackawaxen. The locomotive was immediately detached from the heavy train, and, putting it at the top of its speed, the engineer and fireman gave chase to the deer. In spite of the great speed the magnificent leaps of the buck kept him in the lead. The locomotive whistle was sounded and the exciting chase kept up for a mile, when the deer bounded into the village of Lackawaxen, and found itself in the midst of railroad tracks, canal boats, quarry-men and passing cars. The whistling of the locomotive had attracted the attention of the entire place, and when the deer came dashing furiously down the track, hotly pursued by the locomotive, scores of men, women, and children were out to see the sight. The buck left the track and sprang into the canal. Instantly he was surrounded by a yelling and excited mob. They pelted the poor animal with stones and pounded him with clubs from one side of the canal to the other until he was finally forced to give up, and he was finished by a big quarry-man with a club. Every resident of the village claimed a share of the venison, and the carcass of the buck was divided up so that every family had a piece. The magnificent head and antlers were secured by Capt. Buck, of the New York Hotel at Lackawaxen, who will have them mounted.

THE WORCESTER SIDE-HUNT was to have been held yesterday. The two sides were under the command of Captains A. H. Perry and J. A. Titus. The game score points were as follows: Fox, coon, wild goose, 100; owl, hawk, mink, 50; grouse, 40; woodcock, 30; quail, snipe, duck, plover, gray squirrel, 25; rabbit, 15. The supper will be served at the Bay State House next Friday evening.

GARDNER, Mass., Oct. 16.—On Friday the members of the Monomonack Sporting Club, of this town, start out for their annual hunt. The two sides are under command of Edric Coleman and Charles H. Newton. The judges are S. T. Chamberlain and H. L. Graham. The result of the hunt is to be a supper, to be paid for by the side having the least game.

DEER SLAUGHTER IN ONTARIO.—Ottawa, Oct. 15.—*Editor Forest and Stream:* I have read with much interest the articles in FOREST AND STREAM on hounding in the Adirondacks, and feel sure that all sportsmen must feel grateful to you for your successful efforts in putting it down. Day before yesterday I was more than ever impressed with the harm done by hounding. A friend and myself went for a day's shooting to a village about thirty miles from here. It is situated on a broad ridge of land that runs from the St. Lawrence to the Ottawa, and has always been a favorite resort for deer hunters. On our arrival we heard that the neighborhood contained several camps, and each party had their dogs, "mongrel, puppy, whelp and hound, and curs of low degree," with them. One man who lives in the village told me that the "woods were alive with dogs." The consequence is the deer are getting scarce, and probably—thanks to hounding—in another two years they will be gone altogether. There are game laws in Ontario, we are aware, but how are they enforced? The other day I was reading in one of our local papers—the *Free Press*—the following: "It is reported that 175 carcasses of deer are lying in the woods about the basin near Egansville, which have been killed by the Indians for their skins." Egansville is in Renfrew county, up the Ottawa River. Deer have quite disappeared from parts of this province where a few years ago they were plentiful; and now, too late, sportsmen grumble that the laws were not more strictly enforced—laws they themselves helped to break. Would that FOREST AND STREAM could do for us what it has done for the Adirondacks.—A. K. T.

IN CAHOOTS.—*Editor Forest and Stream:* The phrase "in cahoots," has been for years a familiar one to me, although I do not remember having seen or heard it used in the Northern States. As has been remarked by one of your correspondents, its use has in my experience been coupled with some suspicion of rascality on the part of those to whom the expression was applied. Believing that both "Nessmuk" and his friend George Gause are creditable members of society, I should not have ventured to say they were "in cahoots," and when the first-named gentleman informed your readers that Mr. Gause and himself were "going to hunt cahoots," I took the word to be the local name of some sort of animals, not understanding its meaning when used in this form. I was not alone in my ignorance, and since "Nessmuk's" note of explanation in your last issue, I feel easier, from the fact that as I had never, when in Florida, encountered any creature commonly known as a "cahoot," I felt that I had missed my chance of hunting a new and presumably interesting species of game, and naturally thought that had I succeeded in killing a "cahoot," I might have experienced the same feelings of elation which were the lot of Gordon Cumming, when he had slain what he saw fit to call the "*Antilopus roualeyni.*" Poor antelope!—KELPIE (Central Lake, Mich., Oct. 6).

A DOUBLE ON COONS.—A few days ago while walking along the bed of a dry bayou in a cane brake, with a No. 12 Greener on my shoulder, at a sudden turn I came face to face with two majestic gentlemen, or perhaps gentleman and lady, of the raccoon family. They were ambling along gracefully side by side. When we came into view of each other the distance between us was about a dozen yards. Both parties came to a simultaneous halt. In a moment the gun was leveled with the mental exclamation (on my part), "Good for one with each barrel." I fired a load of No. 6 from the right barrel directly in the face of the right coon and a similar load from the left into the face of the left coon. But there was neither right nor left coon left. If anybody was left it was the shooter, for those two coons ambled off into the cane looking very much disgusted. I think they both had headache. My visions of a pair of broiled coons on toast quickly vanished into smoke. On Oct. 6 I heard a robin in the swamp in Tunica county, Miss., and on the 8th I saw a large number of them feeding on berries. This is about a month earlier than they usually arrive in this latitude. "Wells" has nobly come to my rescue in the partridge controversy, for which I desire to tender my thanks, and would like to inquire of "S." how he feels.—COAHOMA.

MASSACHUSETTS.—South Duxbury, Oct. 12.—Game along the south shore promises to be quite plenty. Quail have done well, and quite a lot of bevies have been seen. They are just beginning to get out of the brush and sun themselves. We have a good sprinkling of partridges this year, but the leaves have hung on late, and this makes it bad for the sportsman and good for the birds. Shore birds are not very plenty; saw a few flocks last week by the Sound every morning. Coot are flying, and "lots of 'em too."—SOUTH SHORE.

Boston, Oct. 15.—I have been after the ruffed grouse a few days, and found plenty of them. Am all loaded and packed for a three weeks' trip to Iowa. Start Saturday, 17th. Hope to strike chicken, duck, snipe and plover.—M.

ALAS, POOR YORICK!—Alas, poor Bill, I knew him well, and with all who knew him regret that he died thus ingloriously, and in his prime. A man of few words, and low, yet every word was truth. Whoever met him in the woods recognized in him one of nature's noblemen. Whoever struck his shanty always received a hearty welcome. But his place in the wild woods is vacant; his boats will rot where he has hidden them; his unerring rifle will be heard no more, and we shall visit the old places with regret that we see him not.—R. M. SHUTTS (Chateauguay Lake, N.Y.).

SQUIRREL MIGRATION.—Memphis, Tenn., Oct. 19.—Millions of squirrels are emigrating from the Mississippi side over to the Arkansas shore at a point commencing about five miles below Memphis and extending down for twenty miles. They are swimming the Mississippi River and evidently making for more elevated ground in Arkansas. Thousands are being killed by farmers, who use sticks instead of guns. A similar emigration of squirrels occurred in 1872.

NEW HAMPSHIRE.—I have just returned from a trip to New Hampshire, where I found game scarce. Partridges are not so plenty as last year, but the gunners are about twice as thick. Flocks of birds are all broken up, and leaves hanging on late made it bad shooting. Foxes are plenty. Coons scarce. It will not pay the coon regiment of Manchester to visit Southern New Hampshire this year.—SOUTH SHORE.

ENOUGH TO BREAK UP ANY PARTY.—The Ottawa Valley trip is off. One of our party was accidentally shot in the head (not seriously), and that broke the trip up when we were about thirty miles from our destination.—X.

ILLINOIS RIVER DUCKING GROUNDS.—In your issue of Oct. 1 "C. S. C." wants to know the best place on the Illinois River for duck shooting. Go to Peoria, then down the river to Spring Lake and you will find blue-winged teal and woodducks till you can't rest, besides a lot of as whole-souled sportsmen as you ever met.—COMMON SENSE.

QUOGUE SHOOTING.—New York, Oct. 18.—I have just returned from a day's shooting at Quogue, L. I. On Oct. 17 I bagged 7 readhead, 9 broadbill, 11 coot, 3 devil divers and 21 boobies. Birds are becoming thicker and thicker now. They stool well and are very tame. There will be better shooting next week, I think.—J. W.

ILLINOIS.—Ellsworth, Ill., Oct. 10.—Saw a large flock of wild geese going south on the 6th inst. Many mallard ducks here just from the north. Thousands of prairie chickens have bunched in large coveys. Scarcely any Bob White; they perished last winter. Weather mild, clear and warm. —DANIEL ARROWSMITH.

FLIGHT OF WILD GEESE.—Springfield, Mass., Oct. 14.—Two flocks of wild geese of about twenty each passed down the river this morning, and although fired at several times from the Agawam side, flew away uninjured as far as known of.—W. A. N.

FLORIDA.—Kissimee City, Oct. 12.—Quail are plentiful here this fall, and good deer and turkey hunting to be had within ten miles. Ducks and snipe have been coming in for about two weeks, and the season is fairly started.—E. D. B.

WORCESTER, Mass., Oct. 17.—There is a fairly good supply of birds, rather more than the average of grouse, and the boys are improving the delightful October weather and making some excellent bags.—E. S. K.

Sea and River Fishing.

AN ANGLER TO HIS ROD.

THOU art a thing of beauty;
Thou wilt ever be a joy,
And to love thee 's not a duty,
For thy sight can never cloy.

Talk of forms of sylph-like maidens,
Full of grace in every limb;
Not a shape in perfumed Aidenns
Is so willowy, lithe and slim.

And in every shining trimming,
In thy silk and silver rings,
Thou art full of beauty brimming;
All too fair for common things.

Then away with every scoffer,
Who in thee can find no pleasure.
Let him con his money coffer;
Never take a moment's leisure.

As for me, I can most duly
Worship at thy liquid shrine,
And to thee I can most truly
Drop a very taking line.

PERCYVAL.

THE ANGLING TOURNAMENT.

THE fourth annual fly-casting tournament was held at the Harlem Mere, Central Park, yesterday. From the tournament the ichthyophagous contingent repaired to the Buckingham Hotel for the annual dinner of the Fish Eating Club.

The day was extremely disagreeable, with a gusty east wind and a drizzling rain.

The FOREST AND STREAM went to press before the conclusion of the casting, and the record is therefore postponed until next week. The score up to 1 o'clock was as follows:

Single-handed Fly Casting: 1st, S. Polhamus, 74ft. 6in.; 2d, W. H. Goodwin, 76ft.; 3d, W. Blackford, 68ft.; 4th, Ira Wood, 71ft.

MAY FLIES.

DURING the summer months we often receive specimens of flies for identification, which are usually accompanied by the statement that the water "is covered with them." In most cases these are one or more of the many species popularly called "May flies," "shad flies," "eel flies," etc., and belong to the class *Neuroptera* or nerve-winged insects, and to the family *Ephemeridæ*, so called because of their short lives, often a few hours only. They may easily be recognized by their four lace-like wings which are always extended, their long, soft, slender bodies, and three hair-like appendages at the end of the abdomen. These insects often appear at night in such numbers as to obstruct the lamps of vessels, and to render the decks slippery when trodden on. Their brief mission in the air is to lay their eggs in the water and die. They are harmless and take no food.

The larva live for a year, or more, in the water, and furnish food for trout and other fishes. They are then long, flat objects with hair-like attennæ and with bushy gills along the abdomen which ends with the long anal hairs seen on the insect. The pupa have the rudiments of wings and rise to the surface when about to transform. At this time the trout devour them in great numbers and fly-fishing it usually poor for a few days. After taking a flight the insect casts another skin before it is perfect, and these cast skins often form winrows along the shores of lakes and rivers. Different species vary in size and color and are locally known by the several names mentioned. The usual one is May fly, but on the Hudson River the fishermen term them shad flies because it is during the season of that fish that they appear. On the Connecticut they are called eel flies.

It is this family which the makers of artificial flies try to imitate in the "green drake, gray drake," etc., and many of the nondescript flies made have "tails" similar to the May fly. The term "drake" seems to be a name used for the fly in England. The family does not seem to be confined to any particular class of fresh waters, as members are found in the rivers and bays along the coast where the water is not too salt, the Great Lakes, and from the cool mountain streams of the Adirondacks to the turbid flood of the St. Johns of Florida.

SYRACUSE, N. Y., Oct. 1.—*Editor Forest and Stream* Last July, while fishing on Oneida Lake, my attention was called to the countless numbers, apparently dead, floating on the water. On inquiry I learned that they are annual visitors to these parts, their stay covering a period of about two weeks, when they disappear. From the residents in the vicinity all I can learn is that "they come and go," which is not at all satisfactory. I would like to learn whence they come and whither they go, and if their presence was not in some degree responsible for the poor success in fishing, as all other conditions were favorable. I inclose specimens and would like to know what they are. Another thing is curious. At certain seasons of the year the water of the lake appears to be thick with small seeds and has a dirty appearance. The fishermen call this "the cleaning process." What is it?—L. S.

[The flies were May flies, see article above. Our columns are open to a discussion of the "cleansing process" or "blooming," as it is termed in parts.]

BLACK BASS FLY-FISHING.

SINCE fly-fishing first became an art, the trout has been the angler's chief game. No amount of trouble has been spared in perfecting this art. Every conceivable experiment in the way of tackle and flies has been tried, columns innumerable have been written on the subject, and reams of correspondence published through the medium of the sporting papers ever since such an institution saw the light. Consequently it would seem as if little more remained to be discovered in this line, save what is entirely local in its character.

But the trout is doomed. How often has this been repeated and proved, and alas! how conscious we all are of the fact! Our only hope remains in fishculture, and this as yet is problematical. As it now is the angler has to go far and seek hard to find his prey, and each year the journey is longer and the seeking harder.

Anglers then, recognizing this fact, are turning their attentions to other quarters. As many of our experts say, "the black bass is the coming game fish." Nay! he is already come. The past thirty years has seen a wonderful extension of this species in the lakes and rivers of our Eastern States. Easily introduced, hardy, vigorous, game to the death, he is now everywhere to be found and furnishes excellent sport in many quarters, where before his advent little or none was known.

Now he stands on even terms with the trout, though scarce ten years ago he was looked on with contempt in comparison. Truly a complete revolution has worked in his case and much of it is due to the able and vigorous pen and inventive ingenuity of Dr. Henshall. His fame will be as much, if not more, of the future than the present. And this revolution has worked a wonderful development of tackle and experience in bass fishing. Now an angler can learn second hand in a few days, all that scarce a score of years ago it would have taken him as many years.

But—and I want this but put in capitals—has not this development taken place almost wholly in one line? Is it not almost wholly in the line of bait-fishing? Where is all our poesy of the gentle art going to? If we are going to get the cream of bass fishing (the coming fishing, mind you) and the true poetry of the art, have we got to sling minnows and chase frogs over the mud flats and hunt crickets through the grass? In other words, when our trout are gone, save in preserves, are we going to become bait-fishers and let fly-fishing, the highest and most charming branch of our art, sink into practical disuse? The facts would seem to indicate it. I will venture to state that of every thirty articles, published by anglers in this paper on bass fishing, twenty-nine of them are entirely on bait-fishing and contain no mention of taking bass with the fly, or of bass flies. Are we then going to give up fly-fishing? Most sincerely I hope not, and so will every fly-fisher, if he thinks of it. And I do not believe we will, for I think that it is merely because bass are so easily taken with bait that we have grown lazy and neglected to bring forward this branch of our art.

Is the bass in fact a "fly-fish," to coin a term, or is he not? Does he take the fly because he thinks it is an insect and is in the habit of feeding on such, or does he "go for it" as a bull rushes at a red rag, merely out of curiosity or caprice? And if the former, what flies is he in the habit of feeding on? Or if the latter, what outrageous combinations are best suited to stir his bile? If we are going to get high sport out of bass fly-fishing, brother anglers, these are questions we must experiment on and discuss.

From the partiality that bass have (especially the smaller size) for the red ibis and high colors in general, I am somewhat inclined to the latter opinion.

It has been quite often said that bass incline to green and yellow, because these are the colors of the grasshopper. This seems absurd. Are the bass in our lakes so much in the habit of feeding on grasshoppers that they carry a clearly defined image of them and their hues in their mind's eye? Is the hopper in the habit of seeking water? Quite the reverse, in fact. He is generally found taking care of his skin in a dry spot. The fish that gets intimately acquainted with the grasshopper is the trout, in some little meadow brook, where they are continually tumbling in, attempting to "jump the ditch." Yet every trout fisherman knows that flies tied with the colors of the grasshopper are not the most successful in such a locality. The reverse, in fact—small, dark flies. We shall have to study our bass patterns on some other theory than the "hopper" then.

Another thing seems absurd to me. When an angler casts for trout up to three pounds in weight he does not generally use a fly tied on a larger hook than a No. 6 Sproat. Now in our Eastern lakes we do not generally take larger bass than this on a fly. Is it not somewhat disproportionate and ridiculous then for the makers to tie, and anglers to use, huge bunches of gaudy feathers tied on Nos. 2 and 4 Sproat, the whole performance quite parallel to what is used to catch a 20-pound salmon?

I confess I have used these myself and had very little luck with them, while lately I have been using trout flies on hooks not larger than No. 5, catching and landing some large bass with quite as much and more certainty than with the others; and I have had much better luck with them too. And then the ease of casting a decent sized fly with a light rod and line! Nothing but a salmon tackle could get out these big affairs with any comfort. In my experience flies on No. 5 hook for stretcher and No. 7 for dropper are, under ordinary conditions, large enough, and yellow, green and red are the colors.

I had always thought that it would be useless to cast for bass, except in shallow water, reasoning, I suppose, from trout experience largely. But last spring Ira Wood had an article on bass fly-fishing which was excellent, as far as it

went (my thanks to him for the same), and in it he remarked that bass would take the fly at the edge of weeds, no matter how deep the water. That gave me some good sport last summer. He also remarked on the cat-like way they often follow and take the fly. I had noticed this myself and it set me to thinking, and that to trying and the trying gave success. Try this: When you see bass following your fly and darting from side to side as you often can in clear water, draw it slowly at first, then let it sink a moment and then give it a quick jerk, and just at this point the bass have a great way of taking it, whereas, if you draw it slowly and regularly in, they would simply follow without taking. You have often done the same thing with a kitten and a string. Now, these two ideas were worth a good deal to me; these are the kind anglers ought to "swop" and discuss. Of course, in different waters bass rise best to different flies just as trout do, but with trout we have a number of standard flies, with which we would attack any water with confidence. Have we such with bass, and if so, what are they? The capabilities of the bass for the fly have not yet been developed. I do not think any one would say we knew it all. As I have said before, the bait department has got the start. Take, for instance, the only book devoted exclusively to this fish, and tell me which is the most prominent.

Every man has one cast, to which he is apt to turn more than to another. His favorite, in short. On our Eastern lakes this is, with me, a grizzly king stretcher and red ibis dropper. The first takes the big ones, the latter the medium weights. For a night fly the yellow May has been more successful with me than the white miller. The biggest strike I ever had and the only time I ever saw a small-mouth bass break water violently like a trout was on this fly. We parted connections, alas, however, he taking my fly with him as a curiosity. For fear lest some of the big vs. small jump on me I will state that there are no big mouths in that lake. Yes, this is the point in which the small-mouth is decidedly inferior, to the fly-fisher, in comparison with other fish to which he is a peer, if not a superior.

Now the summer is over and our sport is nearly done. The time will soon be at hand when we get our angling by mending and making tackle and by exchanging experiences and discussing them. In bass fly-fishing we are all novices, and differ only in degree. We must be, seeing how young the art is. Therefore we would all like to learn, and to do so we must exchange ideas, and we would like to hear, all of us, from those in high places, having authority, what they have learned since last they wrote. At any rate, we won't learn by going to sleep and letting the frog-slingers get the best of us. PERCYVAL.

NEW HAVEN, Conn., Oct. 17.

ON WINDHAM TROUT STREAMS.

I WAS in a small town in Windham county, Connecticut. A friend and myself decided to try if we could not find a few trout in some of the many clear streams. They tried to discourage us by telling us that although the brooks were just the thing for trout and that in former years they had caught a great many out of them, it was no use to try now as the fish were not there. This, however, had no effect on us, as we were both fond of the woods and were only too glad of an opportunity of spending a day in them. We decided first to fish the Mashamoquet, which flows into the Quinnebogue.

We began fishing just below a dam, on which there is a carriage repairing shop and a grist mill, neither of which were running this afternoon, so it was perfectly quiet. We began with flies, but not having a rise after half an hour's fishing we tried worms, and with the first cast landed two nice trout. We tried for quite a while longer in this pool, but not having any more success started down stream, wading down the middle and casting into every pool as we went. When the afternoon's fishing was over, having waded several miles, the only fish we had in our creels were the two we had landed below the dam. Being by this time pretty hungry we started for home.

The next day we struck into a stream just above a meadow which is flooded in winter and where the people cut ice. The stream flows through the center of this meadow for about a mile and a half, and then goes into the woods, getting shallower and wider. There being no pools, there is said to be no fish, but we fished the meadow through and the result was thirty-seven fair-sized trout.

The following day I tried a small brook, my friend taking the same route he had followed the day before. My stream joined the one he was fishing just above the meadow to its rise at a spring about a mile up. Coming down this stream I got thirty-eight fish, making, with the twenty-nine he got, a pretty good catch of fish for a place where "there aint no trout." On our way home we met an old man who, after seeing the luck we had had, advised us to try the stream known as the Lyon brook, saying it had been one of the best streams around here when he was younger.

The next day we started, going west on what was known in stage-coach days as the Providence and Hartford turnpike. Striking into the woods and following a wood path, we came to the remains of a sawmill, which had long since fallen into disuse because of its distance from the railroad. This was the brook we were to fish. After going for quite a while down stream along the bank lined with large pines, under which the brush seemed to have died, making the walking very comfortable, we congratulated ourselves that we were to have a very pleasant tramp after all, although we had not yet taken any fish, though we had seen a good many going over the shallows. But we were soon to find out our mistake, for the whole appearance of the woods changed, the pines were replaced by oaks and chestnuts, and the clear spaces between the trees were changed for thick underbrush. We had now to keep on the edge of the bank or in the stream, both being very undesirable, because the few pools there were lay in the middle of the stream, and consequently we were in full view of the fish. Hoping for a change we kept on in the stream, going in above our waists in some of the muddy places. I always wear cheap canvas shoes instead of rubber boots. The change came soon, but it was for the worse. Trunks of trees and great rocks began to obstruct our path in the stream, the drift of many spring freshets and winter storms, and these were interwoven with tough creepers.

We now debated whether we had not better turn and re trace our steps, but decided to keep on because having been on the stream for three hours we must at least have gone two miles, and must be near the end of our tramp. So keeping on for another hour, climbing over one trunk, under the next, and cutting our way through creepers, we came unexpectedly on a wood road that crossed the stream. Here we sat down to eat what little lunch we had with us. When half through our lunch we were delighted to see a man coming down the road. He seemed surprised to see us and said that people very rarely came down the stream owing to the hard traveling, and then only when they had to. He advised us to keep on, as the traveling was not so bad below there, and where we expected to come out was not more than a mile distant. The only fish he had seen taken lately had been shot as they went over the shallow places; and a great many had been killed in this way. After half an hour of the same kind of walking we heard he sound of the mill in the distance, and knew that our walk was nearly over. We soon came to the mill, and that finished our fishing. It was three miles home, making, with the three miles going, and the four hours on the stream, one of the hardest tramps I ever took, and we had not a fish to show for it. D.

NEW YORK, Oct. 12.

THE "KINGFISHERS."—Menominee, Mich.—*Editor Forest and Stream:* The charge that the "Kingfishers" had broken our game law I know to be false and without the slightest foundation. Having been a resident of the Lower Peninsula of Michigan for nineteen years, and spending a month or two every fall in the northern part hunting, I have come to know of the "Kingfishers" in the years gone by, and know them all to be true and ardent sportsmen, men whom no one can truthfully say ever infringed the laws of the State. Let any one go over the ground where they have camped and hunted and fished since the first of their camp-fires was kindled in old Michigan, and I defy any one to find a single person that has aught against them. I deeply regret that any one should accuse the "Kingfishers," and I thank you for your refutation of the slander.—S. E. B.

A BIG CAYUGA LAKE BASS.—Seneca Falls, N. Y., Oct. 13.—The largest small-mouthed black bass ever recorded in this section was captured yesterday off East Varick, in Cayuga Lake, near here, by Mr. Thomas Blodgett, of this place. The old "Triton" weighed 6½ pounds after being out of water ten hours. It was taken with a fly on an 8-ounce rod and fought for a full half hour before being landed. Mr. Blodgett took ten other bass at the same time, the total weight of the catch being 32 pounds. Tom is conceded to be the champion fly-caster of Seneca county, but the above average beats any of his former scores. Bass fishing on Cayuga Lake has been unusually good throughout the present season, owing doubtless to the fact that many nets have been confiscated and destroyed.—L. G. S.

THREE TO EACH ROD.—In connection with some good fishing, the following occurred at Big Island Pond, one of the Seven Ponds, Maine, Sept. 16, 1885. Mr. E. E. Allen, Boston, Mass., and C. C. Maxson, of Westerly, R. I., while fishing from the same boat, struck and played at the same time six trout, three to each rod. Five of them were safely netted and weighed in the aggregate three pounds and fourteen ounces. As to a choice of fly for these waters, it was noted that of fourteen fish taken one morning twelve were upon the "Parmachenee Belle" used as an upper dropper. Did its location have anything to do with the preference shown? This preference was marked at all times, but not always so strongly as upon the occasion mentioned. —M. N.

NEW MEXICO TROUT FISHING.—Mr. F. B. Thurber, of this city, contributes to the *American Grocer* a pleasantly written account of a trout fishing excursion to the Ruidosa, a mountain stream twenty-five mile from Fort Stanton. His companions were Colonel Meisner and Lieutenant Scott, of Fort Stanton. The party had a delightful time and caught a capital string of fish. They fished with the fly, but we regret to observe that Mr. Thurber speaks of his rod as a "pole."

A NIPPISING MASKINONGE.—A maskinonge has been taken in Lake Nippising, near North Bay, which measured 49 inches in length with a girth of 21 inches, and weighed 39 pounds. Nine revolver bullets were put into the monster before it was landed. It is to be sent to the Fishery Exhibit in London, Eng.—A. K. T. (Ottawa, Ont., Oct. 14).

SHOOTING TROUT WITH A SHOTGUN is one of the forms in which New England barbarism manifests itself. And yet they complain of the scarcity of fish.

Fisheculture.

Address all communications to the Forest and Stream Publishing Co.

SUCCESS OF SALMON IN THE HUDSON.

AS our readers are aware, Prof. S. F. Baird, U. S. Fish Commissioner, has been stocking the Hudson with salmon fry for the past two years. The fish have been hatched at Cold Spring Harbor, N. Y., by Fred Mather, and distributed by him in the small streams of Warren, Essex and Hamilton counties which flow into the Hudson. Among other streams stocked was Clendon Brook, Glens Falls, and our correspondent, Mr. A. N. Cheney, has at times reported their appearance there in private letters and was asked for specimens. Last Monday he sent six or eight fish, of six to eight inches, and the following letter to Mr. Blackford, State Commissioner:

GLENS FALLS, Oct. 9.—*Mr. E. G. Blackford*—Dear Sir: As requested in your letter of July 2, I send you to-day by National Express specimens of the young salmon from Clendon Brook. I was absent when your letter came and have been home very little since, which is the cause of the delay. I told Mr. Mather that I would certainly get them before winter. I engaged a man to take the fish, but he was not successful, owing to high water. Yesterday I went to the brook with a friend, Mr. W. D. Cleveland, of Houston, Tex., and in a short time caught the number I send. You will, perhaps, remember that Mr. Mather sent me 40,000 salmon fry on May 21, 1884, and 60,000 salmon fry and 150 yearlings April 29, 1885, from Cold Spring Harbor, and all were deposited in Clendon Brook, a tributary of the Hudson. The Clendon was once a famous trout stream, yielding trout of 4 pounds and upward, and still there are some few baskets of small fish taken from it. Yesterday the stream seemed fairly alive with salmon for a mile, and residents tell me that this is the case its entire length. As the trout were attending to their domestic duties up stream the brook was given over to the salmon. They were in the deep holes and at the foot of the riffs, but everywhere in numbers. There seemed to be two distinct sizes, one four to six inches long, the other two to three inches long. With the exception of a few chubs, silver chubs or fall fish, *S. bullaris*, I found no other fish than salmon in the stream. One bright-colored male salmon as I took him from the brook discharged milt from the pressure of my hand. This particular fish I caught in swift water where it ran over gravel. I hope Brother Mather will have an opportunity to interview these young things that were graduated from his University at Cold Spring Harbor before they are sent to Prof. Baird. It would have been an easy matter to catch a hundred yearlings during the time I was at the brook, and in their eagerness to take the lure they jumped clear above the water. After catching the first salmon Mr. Cleveland exclaimed: "If that beggar weighed thirty-two pounds" (he had in mind a salmon caught this summer by Mr. H. P. Wells) "and game in proportion, and I had fought and killed him, it would have taken just six months to recover from the excitement." The Clendon brook is posted its entire length and the people are interested in protecting the fry that have been deposited therein by the United States Fish Commission. I trust that you will receive the salmon in good order. I send but one of the smaller size, as the other and larger salmon gave no kind of show to take the hook.

A. N. CHENEY.

[We saw the fish at Fulton Market and they have gone to Washington.]

THE OYSTER PROBLEM ACTUALLY SOLVED.

A NEW SYSTEM OF OYSTER CULTURE.

DURING the five years that I have been engaged upon the study of the oyster problem, I have never lost sight of the practical aspect of it, and have worked from the beginning in the hope that I might reach some really valuable results. In the belief that what I now have to present is practical and founded upon an appreciation of the essential principles involved, I offer it to the consideration of oystermen, especially those who have had experience in the use of cultch for the purpose of collecting spat. The U. S. Fish Commission, under whose auspices I have been able to conduct my experiments, deserves the greatest credit for the interest which its chief, Professor Baird, has uniformly shown in this, one of the most important of all the problems brought before it for solution.

The developments made within the last six years show that the solution of the most important problems in oyster culture, by means of artificial methods, is possible. This may seem an extravagantly sanguine view to take of the matter, nevertheless it is true that it is actually possible to begin at once with the knowledge now in our possession, and not only be successful, but also be so to a degree which must completely revolutionize the business of the bed-culture of this mollusk in open waters.

The results of Brooks, Winslow, Rice, Mather, McDonald and myself in this country the public is already more or less familiar with. In Europe Mr. Bouchon-Brandely, Professors Hock, Horst and Möbius have been equally active. Over twenty forms of incubating apparatus have been used by the writer in his own experiments. In none of this apparatus—except in one form of it, I am obliged to admit—was it found that results of startling economic importance were obtained. While this is true, it is nevertheless a fact that observations were made and results obtained which indicate that there is a feasible method of spat culture of unlimited productiveness. All that is needed is to bring together the proper combination of conditions which it is now proposed to indicate on the basis of well-known facts which may be verified by any one who will take the trouble to do so. Unable or unwilling at first to abandon the cumbersome and expensive method of spat culture practiced in Europe, our results have hitherto been of little practical value. This resulted from a radical misapprehension of what were the essentials of a rational method. While the work has been immediately fruitless, mediately it has not been so, for the light gained as the result of all the work of others as well as my own, now enables me to state with certainty why we have failed. Failure is a harsh word, and it is an humiliating one as well; but it will soon be seen that we have been cultivating a lot of fallacies and erroneous conclusions which led to it. In a word, we have neglected to think about what we have observed, so as to elaborate a practical theory of spat culture.

The elementary principles of the new theory of oyster, or rather of spat culture, which I here propose are the following:

1. Oyster embryos, under ordinary conditions in open water, diffuse and affix themselves throughout the three dimensions of such a body of sea water. This is a well-known and readily verifiable fact.

2. The fry will adhere to smooth surfaces as well as to rough ones.

3. The surface upon which spatting occurs must be kept as free as possible from sediment and organic growths, in order that the tiny young mollusks may not be smothered and killed during the most critical period of their lives.

4. Artificial fertilization of the eggs or the oyster is feasible, and will become an important adjunct to successful spat culture.

5. Water charged with embryo oysters may be passed through a steam pump without injury to such embryos.

6. Oyster fry adheres to the under surface of shells or other collectors most abundantly because the lower side is cleanest and most favorable to the survival of the animals.

7. The spat of the oyster will grow and thrive with comparatively little light.

8. The specific gravity of the water may range from 1.003 to 1.0235.

9. The most favorable temperatures of the water for spatting seem to be from 68 degrees to about 78 or 80 degrees Fahr.

10. Spatting will occur just as freely in ponds or tanks as in the open water.

These are well ascertained elementary facts and upon them we must base our new method, which is essentially a system of spat culture, or method of rearing seed oysters for the purpose of cultivation on the open beds or any suitable bottom. We must, however, first of all throw aside as too expensive any and all systems in which tiles or slates are used, especially if these must be fastened together in nests and coated with lime and cement, as practiced in Europe. Oysters are too cheap in America to be produced by any of the old-fogy systems which are available there, as it will not pay to flake off the spat from the collectors under ordinary circumstances in cultivating the American oyster for market, because of its low price.

The thing to do is to arrange the collectors used in such a way as to expose an enormous area of surface to which the billions of fry floating about in the water may affix itself. According to the first principle stated above, we found that oyster fry would diffuse and affix itself to cultch throughout the three dimensions of a body of water. The collectors must therefore be so arranged as to occupy these three dimensions. It will be obvious to any one that such a method is applicable in a way which will come into competition with the older methods in vogue in Long Island Sound. To effect this it is proposed to provide a pond, natural or artificial, and connect it by way of a long zigzag canal with the open water. The area of the pond should about equal the area of the canal. Both the canal and pond should be of about the same depth, or say about 3½ feet at low water. No filters or any appliance of the kind is needed, except perhaps a screen at the mouth of the canal to keep out starfishes, crustacea and predaceous mollusks.

The canal is provided with ledges near the top to support the receptacles for the cultch. These are formed of vertical wooden strips six inches wide, six feet long, and secured to each other parallel and three feet apart by a crosspiece at the top and two horizontal side-pieces six inches wide, secured two feet six inches from the top of the vertical pieces. Coarse wire netting is then secured to the edges of the vertical strips below the two parallel cross-pieces. This netting will then form, with the wooden frame, a basket three feet wide, three feet deep and six inches thick. Such a basket will hold some-

what over three bushels of oyster shells as cultch. The two cross-pieces which project beyond the vertical pieces will support the receptacle with the shells which it contains. One of these is allowed to every running foot of canal, the receptacles being placed six inches apart. A pond forty feet square and accommodating a hundred bushels of spawning oysters, will supply enough fry for a canal 400 feet long and holding 1,200 bushels of shells as cultch in 400 receptacles. The latter will cost $70 per hundred, or $280 for 400 feet of trench. One bushel of oysters will yield about one billion of fry. The pond with its hundred bushels of spawning adults will, therefore, yield about 100 billions of fry. This vast multitude of oyster brood will be wafted back and forth through the collectors by the tides 360 times during the spatting season, which lasts for ninety days. That is, 100 billions of fry will be wafted through 1,200 bushels of shells 360 times during the season. These shells can be kept clean by vibrating the receptacles on the ledges which support them. It will thus be seen that on one-tenth of an of an acre I can place as much cultch as could ordinarily be placed on four acres. Or, by my method, on one acre I can put down as many shells as could be put on forty acres by those who simply sow the shells; that is to say, the business of getting "sets" for seed can be condensed so as to cover only one-fortieth of the ground now covered.

The plan as set forth above is not founded merely on a specious hypothesis, but is justified in detail by the facts observed by myself in the course of the experiments instituted by me during the period covered, as already stated and under the auspices of the U. S. Fish Commission. In nature the theory is also abundantly verified, as at Fortress Monroe, Wood's Holl, and Cohasset for example. The fullest justification of the conclusions above presented is also given by the more recent results at St. Jerome's Creek, as well as by the results of experiments instituted by Blackford and Mather. The details are, however, given at length in an illustrated article of mine, now ready for publication by the U. S. Fish Commission, and entitled: "An Exposition of the Principles of a Rational System of Oyster Culture, together with an account of a new and practical method of obtaining oyster spat on a scale of commercial importance."

Thousands of acres of the flat, marshy land skirting the Chesapeake may now be converted into establishments for the culture of oyster spat or seed oysters, to be afterward sown on the open beds and allowed to grow to a marketable size. The future of the oyster industry in the South is henceforth assured, all that has been needed is the adoption of a rational, economical method of spat culture, such as the one here proposed. This system of plant, if adopted, will pay for itself in fifteen months in its yield of seed oysters alone. This ought to be sufficiently encouraging to the most conservative oystermen, whom it is proposed to convince of the feasibility of the new system whether they now choose to believe it or not.

I may fitly close this brief notice of the new method by an extract from the concluding part of my forthcoming paper, already alluded to: "It has been found that even the sowing of shells is profitable, as has been conclusively demonstrated; and in one type of culture, namely, that which is practiced in deep water, it is probable that it is the only practicable method which will be devised for a long time to come. While that system is, to a great extent, wasteful and at times uncertain, for the present, at least, there seems to be no other which can be as economically and successfully operated over large navigable areas. Large areas operated by one individual or corporation cannot, however, always be controlled, or only exceptionally, under the existing laws of Maryland and Virginia. In those States, however, where it is possible to command the right to natural areas of water which are more or less nearly landlocked, the system of merely sowing shells would be positively wasteful and not in conformity with the results attainable under the guidance of the proper knowledge. It is found in the practice of shell sowing that extensive areas will sometimes fail to produce any spat. This is apparently due to the presence of currents, which have swept the swimming fry off of the beds, or to the presence of sediment, which has put an end to the first stages of the fixed career of the youngest spat. Even after the spat is caught great destruction may occur through the inroads of starfishes, or a too rapid multiplication of worm tubes, built by tubicolous annelids over the cultch and spat. The latter is sometimes smothered in vast numbers from the last-mentioned cause, as has been recently discovered by Mr. Rowe. Such casualties are rendered either impossible or readily observable during their early stages by the use of the method of inclosing the cultch in suspended receptacles, as suggested in this paper. The wire netting will effectually protect the young spat against the attacks of large starfishes, and no growth of barnacles, tunicates, worm tubes or sponges would be rapid enough during the spatting period, judging from an experience extending over several seasons, to seriously impair the usefulness of the cultch used in the suspended receptacles. * * *

"The maximum efficiency of the cultch is not realized in any of the old forms of collectors, for the reason that the cultch cannot be kept clean. Secondly, because both sides of the cultch cannot be exposed to the passing fry. Thirdly, because the fry cannot be compelled to pass over and among the cultch repeatedly. Fourthly, because the cultch is scattered over too great an area, and throughout only one dimension of a body of water, namely its horizontal extent, whereas it is possible, as I have shown above, to do far more; that is, to avail ourselves of the possibility of obtaining spat throughout the three dimensions of a body of water charged with embryo oysters in the veliger condition. There are good and sufficient reasons for my assertion that cultch has hitherto been wastefully and unscientifically applied. With this I must conclude this exposition of the principles of a rational theory of oyster culture, a subject which has received the attention of many investigators, none of whom have, however, struck at the root of the question and allowed themselves to be guided by obvious and readily verifiable facts. In the hope that I have made both the theory and practice of my new method clear to the reader, who, if he should happen to be an oysterman, will, I hope, at least give me the credit of being honest and sincere in my intentions, and whether he feels inclined to ridicule or to adopt my conclusions, I feel very certain that what I have formulated in the preceding pages will become the recognized doctrine and practice of the future."

John A. Ryder.

CARP FOR OHIO.—The annual distribution of German carp, under the supervision of the Illinois State Fish Commission, will commence about November 1 to 15. All who have ponds prepared for their culture and desire fish should make application at once. Each applicant will receive twenty carp. Applications should be in writing, stating location of pond, area and average depth of water and whether free from other fish or not, giving nearest express office and name of post-office. Applications should have the indorsement of a member of the general assembly. Applications will be filed, entered and numbered as received and fish shipped in same order. All applicants will be notified in advance of shipment. Application can be made to either of the commissioners: N. K. Fairbank, President, Chicago; S. P. Bartlett, Secretary, Quincy; Maj. Geo. Breuning, Centralia.

LIVE SOLES IN NEW YORK.—Capt. Hamilton Perry, of the White Star steamer Britannic, arrived in New York on Monday last with nine live soles for Mr. E. G. Blackford, sent by Mr. Thomas J. Moore, of the Liverpool Museum. They were brought in the hanging globes known as "Mortimer's Ship Aquaria," and arrived in good order. The fish are of the size of a man's hand, and Mr. Blackford has offered them to Prof. S. F. Baird, United States Commissioner of Fisheries, to be disposed of as he thinks proper.

MR. SILK AND NEW JERSEY BASS.—Mr. W. T. Silk, the pisciculturist, who came to this country from England about a month ago for the purpose of securing a large number of black bass for stocking purposes in Great Britain, is having a hard time of it. During a previous visit Mr. Silk and Fish Commissioner Blackford had a flare-up because the bass Mr. Silk had collected to take home were netted in Greenwood Lake. Prior to Mr. Silk's coming this year he arranged with certain Greenwood lake fishermen to catch for him about two thousand bass. Anticipating trouble if the fish were taken from the lake, the fishermen decided to catch the bass in Lake Wawayanda, a beautiful sheet of water on the crest of Bellevale Mountain, which is about eight miles to the westward of Greenwood Lake. Many fish were caught, ostensibly by hook and line. They were to be sent to New York on September 30, for Mr. Silk had arranged to return home by the White Star steamer Adriatic. The three tanks he brought over with him were put on board and filled with water for the reception of the fish. Just before the steamer was to sail Mr. Silk learned that the parties who had contracted to furnish the bass had become frightened and returned the fish to the lake. It has now leaked out that this was done because the fishermen found they were watched by persons in the employ of the New York State Fish Commission. Commissioner Blackford, it is said, has announced that no bass taken in New York State shall leave this city in Mr. Silk's charge, except those that it can be proved were taken in a legitmate way—that is, by hook and line. Mr. Silk is in great trouble, and his tanks, branded with the Marquis of Exeter's name and address, are now heaped up on the White Star dock. Mr. Silk says he has no desire to break the law, but that he feels that he should be permitted to carry to England such fish as are caught legally. Professor Baird of the United States Fish Commission, having heard of the trouble, sent Mr. Silk this week 250 small black bass from the United States Hatchery at Wytheville, Va. The fish arrived in good order, and are now on Long Island awaiting the departure of Mr. Silk for home. These fish are a present from the United States to the Marquis of Exeter.—*N. Y. Herald.* The cause of Mr. Silk's troubles was the Passaic County Fish and Game Protective Association. The secretary of this association some ten days ago received information that Mr. Silk was endeavoring to get hold of a lot of fish from Greenwood Lake, and remembering the dishonorable and unsportsmanlike manner in which Mr. Silk got his fish a year ago, steps were at once taken to prevent him from carrying out his project of netting Greenwood Lake. Through the efforts of the association it was learned that Mr. Silk had paid Warren Aldrich, who lives at the upper end of Greenwood Lake, one hundred dollars to get him a lot of bass. Mr. Aldrich evidently had an offer of better pay, for he notified the guides and natives about the lake that he would pay five cents each for black bass and that he would take ten thousand of them. Netting in Greenwood Lake is difficult in the New Jersey portion of the lake, and as Mr. Aldrich also lived by the New York part of the lake the secretary of the association communicated with Mr. Eugene Blackford, the N. Y. State Fish Commissioner. This gentleman promptly responded and sent Mr. J. H. Godwin, Jr., of Kingsbridge, one of the New York fish protectors, to the lake. Mr. Godwin worked in concert with the association and it was ascertained that Mr. Silk also expected to get a lot of bass from Wawayanda Lake and that arrangements to this effect were carried out. Some bass were caught in Greenwood Lake, but the business was detected in time to prevent their shipment, despite Mr. Silk's hurried orders to send them to New York. Mr. Silk worked very quietly, even going so far as not to sign his name to communications he sent to Mr. Aldrich, but he was not quiet enough about it and consequently his project failed. Had it not been for the Passaic County Fish and Game Protective Association, Greenwood Lake would have lost a large number of bass.—*Paterson (N. J.) Press, Oct. 12.*

THE NEW YORK FISH COMMISSION met yesterday and appropriated $26,000 for the ensuing fiscal year. The president was directed to send to Oregon for some specimens of the valuable trout known as the *Salmo purpuratus* with which the different streams of New York State may be stocked. Mr. Blackford was authorized to communicate with the German Fisheries Commission with a view to effecting an exchange of eggs of the German brown trout for eggs of our rainbow trout. Commissioner Sherman reported that the Adirondack fishery is now completed and the employees are engaged in obtaining spawn for the purpose of stocking.

CARP FERTILITY.—The Newark *Call* reports: "A carp pond at Moorestown, belonging to Samuel K. Wilkins, treasurer of the American Carp Cultural Association, was drawn off on Monday and found to contain over a million small carp. They are the progeny of thirteen fish that are now three years old, and measure over two feet in length. The young fish (three weeks old) measure about an inch in length."

All lovers of nature will thank Mr. George A. Musgrave for his protest to a London paper against the wicked cruelty by which millions of bright plumaged birds are so ruthlessly sacrificed to fashionable whim and caprice. "In April," says Mr. Musgrave, "I went to an auction room, and, after looking at the bodies of hundreds of birds, ascertained that between December, 1884, and April, 1885, there had been sold 6,828 birds of paradise, 4,974 Impeyan pheasants, 770 so-called Argus, 404,464 West Indian and Brazilian birds, and 356,389 East Indian birds of various kinds. Leaving the city, I went to another district, and there saw the birds being mounted for the milliners, upholsterers, and dealers in fancy articles. Pursuing the birds still further, I traced the breast of a *Lophophorus impeyanus* to a servant's Sunday hat, and some hummingbirds and a kingfisher to a shop in a popular watering-place, where cabinet photograph frames were adorned with three birds and a dead kitten. At first I was inclined to believe that, in spite of the numbers of birds sold, the demand for them was confined to people whose taste was gratified by a vulgar display of what had the appearance of costliness." In this belief, however, he found himself mistaken. Just now there is, it seems, a craze for yellow, and Mr. Musgrave tells us how he heard of an order being given by a young English lady for a dress to be trimmed with canaries. We are human, but this young lady deserves to be pecked to death by sharp-beaked birds. "Fortunately, before the order was carried out, she, being capricious, changed her mind, so only eight little birds were sacrificed to the prevailing craze for yellow."

A familiar Parisian feature is likely soon to disappear—the toy cannon in the Palais Royal, fired daily by the sun at noon ever since 1788. The tiny piece is the delight of the French *bébés* and their nurses, while even many sober elders set their watches by the daily report.

POINTS WORTH CONSIDERING.

1. Because of the compact style of its typography the Forest and Stream actually contains, weekly, more reading matter pertaining to its chosen field than is found in any similar publication in the world.

2. In general excellence the reading columns of the Forest and Stream are of a higher grade than those of any similar publication in the world.

3. Taking into account the amount and the character of weekly reading given, the Forest and Stream is away ahead of any similar publication in the world.

4. If a sportsman wishes a sportsman's paper, he will be better suited by the Forest and Stream than by any similar publication in the world.

FIXTURES.

BENCH SHOWS.

Dec. 15, 16, 17 and 18.—First Annual Dog Show of the Western Connecticut Poultry, Pigeon and Pet Stock Association. Frank D. Hallet, Superintendent, Winsted, Conn.

April 6, 7, 8 and 9, 1886.—Second Annual Dog Show of the New England Kennel Club. Jean Grosvenor, Secretary, Boston, Mass.

FIELD TRIALS.

Nov 9.—Second Annual Field Trials of the Fisher's Island Club, for members only. Max Wenzel, Secretary, Hoboken, N. J.

Nov. 9.—First Annual Trials of the Western Field Trials Association, at Abilene, Kan. Entries close Oct. 15. A. A. Whipple, Secretary, Kansas City, Mo.

Nov. 12.—New Jersey Kennel and Field Trials Club. Field trials for members only at Fisher's Island. A. P. Vredenburgh, Secretary, Bergen Point, N. J.

Nov. 16, 1885.—Seventh Annual Field Trials of the Eastern Field Trials Club, High Point, N. C. Entries for All-Aged Stakes close Nov. 1. W. A. Coster, Secretary, Flatbush, L. I.

November.—Fourth Annual Trials of the Robins Island Club, Robins Island, L. I., for members only. Wm. H. Force, Secretary.

Dec. 7.—Seventh Annual Field Trials of the National Field Trials Club, Grand Junction, Tenn. Entries for Derby close April 1. B. M. Stephenson, La Grange, Tenn., Secretary.

A. K. R.—SPECIAL NOTICE.

THE AMERICAN KENNEL REGISTER, for the registration of pedigrees, etc. (with prize lists of all shows and trials), is published every month. Entries close on the 1st. Should be in early. Entry blanks sent on receipt of stamped and addressed envelope. Registration fee (50 cents) must accompany each entry. No entries inserted unless paid in advance. Yearly subscription $1.50. Address "American Kennel Register," P. O. Box 2832, New York. Number of entries already printed **2794.**

ABOUT COCKER SPANIELS.

Editor Forest and Stream:

The more I read and hear about cocker spaniels the more I get "mixed" concerning them. I have talked with men who have judged them, men who have bred them, and have tried to understand the "Senex" papers on the subject, with the same result, am mixed, very mixed.

I have carefully studied the two standards, and it seems to me that the I. C. S. Association standard is a copy, almost word for word, of the A. C. S. standard. The only difference of any account that I can perceive is in the weight. I have bred cockers (and now own twelve) and expect to breed many more of them, and therefore I would like to have the matter straightened out as it were. So I have a suggestion to submit that may make "Senex" positively howl with rage and cry aloud for protection to the dear little cockers of his boyhood days. Before I make my suggestion I want to ask a conundrum, which I would be glad to have answered by a representative cocker man through your columns. We will suppose a cocker, weight say about 26½ pounds, wins several prizes, and finally wins in champion class a few times. After a while a competitor comes from the open class and "downs him" and with a likelihood of repeating the process show after show. By feeding the first mentioned dog up to say 28½ pounds, can he or she be entered in the field spaniel open class and commence to scale the ladder again? I cannot see what there is to prevent it. The dog is not a cocker because he is over 28 pounds, but he must be something. Because a poor little spaniel gets a little obese, as his friend man is apt to do, is it right that he should be completely wiped out of his status in dog society by a cast-iron rule that says to him, "If you dare to get over 28 pounds you are no longer a cocker but a wretched—nothing?" No such ridiculous rule applies to any other breed of dog, and why should the so-called cocker be treated any different? A pointer may be under the 50 pounds limit, but if he grows a little stouter he is still a pointer and can be shown in the class over 50 pounds I suppose, anyway he is still a pointer, isn't he? Weight does not make a breed; but this is actually what every dog show premium list practically says.

Savage reader, do you see my difficulty? If the dog I have mentioned is not a "cocker" what is he? Everybody I have talked with on the subject, and among them at least two who have judged "cockers" at representative dog shows, say that he would be a field spaniel! Very good. Now, if he is a field spaniel, now he is slightly over 28 pounds in weight, why the dickens should he be called a "cocker" when he was a little slighter, so to speak?

Having ranged on the subject somewhat, I now make my suggestion, which is—somebody hold "Senex"—to wipe the "cocker" completely out of existence and call them all field spaniels, divided in two or three classes by weight, on the same principle as the pointers are now judged. For my part I would say two classes only are desirable—over and under 28 pounds; but if "Senex" is to be considered by all means let there be three classes, say under 22 pounds, over 22 and under 30 pounds, and over 30 pounds. Everybody would then be happy, "Senex" could disband his pet I. C. S. Association and join hands with the other spaniel men, and the American Field Spaniel Club would be a booming success. Spaniel breeders would know what they would be driving at. The public would understand also and everything would be as lovely as "the flowers that bloom in the spring, Tra la."

I, therefore, as a spaniel breeder and exhibitor, call on the management of the kennel clubs in this country to expunge the word "cocker" from the premium lists of their future shows, and ask them to have two or three classes for field spaniels, arranged as they think best. I would be glad to have the American Spaniel Club (of which I am not yet a member) join with me in the matter. Cave Canem.

SPECIMEN BRICKS.

I.

Editor Forest and Stream:

As I am a subscriber to your weekly publication, the Forest and Stream, and also to the *American Kennel Register*, I write to you for information on the following subjects: Please to state from whom I can obtain a handsome, well-bred setter dog, English, Irish, Gordon or native, or a grade from these strains, about three years old, that is a remarkably fine animal in scenting faculties and is particularly very excellent and staunch on woodcock and ruffed grouse, a reliable and good retriever of all game from land and water, a prompt backer, with a gentle and not vicious disposition, and steady and staunch also on quail and snipe. I would require him to drop to shot, and would prefer lemon and white with dark eyes and black nose, or as much white as possible mixed with any other color, but would not object to any color with the qualities written, but would not desire great speed; rather a brisk, active, untiring hunter. Mention price and whether guaranteed. I wish also to ascertain about cocker spaniels and the ones weighing twenty-five to thirty pounds, for hunting woodcock and ruffed grouse in thick covert. Can they be used with success when entirely well broken and reliable retrievers from land and water, equal to that obtained by the use of setters and pointers, or are they superior for such work? Mention from whom a pair, thoroughly broken, can be obtained, with the price and any details about their weights and other matters connected with them that may be of interest: also whether guaranteed. I would require dogs, not bitches,

that have been hunted several seasons—two or three. Pedigrees to be given. I will thank you for full particulars. I am gentlemen, your obedient servant, — — —

II.

Editor Forest and Stream:

I can secure for you one year's subscription, paid in advance, and renewed year by year, if you will kindly publish the inclosed. I am personally acquainted with Mr. Hay, and have carefully examined his dogs. They are, without exception, the finest in all respects of any Dandie Dinmonts in the country. Mr. Hay would also like to correspond with the breeders of these dogs in this country, and will enter or pit his against all comers. Hoping to hear from you in time to see the notice in your next issue, I remain yours very respectfully —— ——.

[THE NOTICE.]

Mr. James Hay, of 402 Christopher street, Podunk, N. Y., is the owner of a fine Dandie Dinmont dog named Bob, and bred by Thomas Maxwell, of Dumfries, Scotland, one year old, and brought to this country in March, 1885. In color, pepper and salt, pure hair, arch back, good front and tail, weighs twenty-two pounds. Is the sire of ten pups, five by bitch Elsie, and five by Jessie, all three months old, and warranted pure. Bob's pedigree will be furnished on application to Mr. Hay. Six of the pups are for sale. Will send photographs if desired.

THE CALIFORNIA KENNEL CLUB.

Editor Forest and Stream:

A very enthusiastic meeting of lovers of the dog was held here last evening for the purpose of forming a kennel club. Judge Ferral called the meeting to order and briefly stated the object of the proposed organization. It was then voted that the association be called the California Kennel, Bench Show and Field Trial Club. A resolution was adopted stating the object to be the improvement of the various breeds of dogs and the prosecution of dog thieves and poisoners by offering rewards for their arrest and conviction, and the holding of bench shows and field trials. The fee for membership was made fifty cents. The officers elected are as follows: President, Judge Robert Ferral; Vice-Presidents, O. A. Tolle and E. Leavesley; Secretary, W. G. Cue; Treasurer, James E. Watson; Sergeant-at-Arms, E. Reilly. A committee of seven was appointed and instructed to report at the next meeting the names of eleven gentlemen, representing the different breeds of dogs, for an executive committee. Judge Ferral, James E. Watson, Wm. McGregor, O. A. Tolle, J. B. Lewis and H. Fritch were appointed a committee on constitution and by-laws to report at the next meeting. The address of the secretary is 539 California street. Oc.

San Francisco, Oct. 1.

DANBURY DOG SHOW.

Editor Forest and Stream:

The fourth annual bench show of the Danbury Agricultural Society was held here last week. There were 105 entries in the catalogue, several of which were absent. I noticed some that were not down, and cannot give you just the number present. The fair is always one of the best in the country, and the number of visitors is simply immense. There was a crowd around the dogs at all times—in fact, they were one of the chief attractions of the fair. Following is a complete list of the

AWARDS.

POINTERS —*Dogs:* 1st, D. Scott's Ned; 2d, A. A. Raymond's Duke Royal (A.K.R. 3472). *Bitches:* 1st, F. Remitti's Phyllis (Sensation's Son—Bell); 2d, A. A. Raymond's Lizzie Grace (A. K. R. 2,476). *Puppies:* 1st, F. Remitti's Wizz (Buff—Belle); 2d, A. A. Raymond's —— (Duke Royal—Lizzie Grace).

ENGLISH SETTERS.—Champion—*Dog:* Blackstone Kennels' Plantagenet (Dashing Monarch—Petrel).—Open—*Dogs:* 1st, Blackstone Kennels' Mack B. (Dick Laverack—Twilight); 2d, C. E. Colpaugh's Dan. Very high com., G. B. Fairchild's Spright (Dash—Gem) and A. Free's Dash (Dash—Nellie). *Bitches:* 1st, Blackstone Kennels' Grace B, (London—Dawn); 2d, withheld. Very high com., A. Free's Nellie (Sport—Nell). *Puppies:* 1st, 2d and very high com., Diamond Kennels' Kenilworth (Dash—Dot), Lendine (Glen—Frisk) and Nellie (Dash—Dot).

IRISH SETTERS.—*Dogs:* 1st, F. S. Parrott's Gerald (Glencho—Zelda). *Bitches:* 1st, F. S. Parrott's Rose of Killarney (Killarney—Lill III.) *Puppies:* 1st, withheld; 2d, L. D. Judd's Helene. Very high com., I. C. Reynolds's unnamed.

LAVERACK SETTERS.—1st, withheld; 2d and very high com., C. C. Phillips's Mattie and Duke.

MASTIFFS.—*Dogs:* 1st, Diamond Kennels' Tiger (Don Pedro—Countess); 2d, P. R. Penney's Nero (Leo—Viola). *Bitches:* 1st, M. Meyer's Bessie (Ajax—Nellie). *Puppies:* 1st and very high com., Diamond Kennels' Yuno and Duke (Max—Judith); 2d, Scotch Collie Kennel Club's Jim. Very high com., T. B. Doolittle's Tony (Turk—Countess).

NEWFOUNDLANDS.—1st, G. W. Daton's Prince; 2d, J. McNiff's Nero.

COLLIES.—*Dogs:* 1st, W. Scott's Shep (Sweep—Pert). *Bitches:* Equal 1st, E. Field's Belle (Marcus—Juno) and Scotch Collie Kennel Club's Lothian Maid (Ernest—Tibbie); 2d, Scotch Collie Kennel Club's Tibbie (Tramp—Heather). Very high com., Scotch Collie Kennel Club's Midlothian Lassie (A.K.R. 2124). *Puppies:* Equal 1st and 2d, F. H. Warner's Don and Major of Fairview and June Fairview (Ned of Fairview—Cressie Fairview). Very high com., E. T. Hunt's Mac (Marcus—Juno) and D. J. Corwin's Flash (Gaffa II.—Flyaway II.).

SPANIELS.—Field.—1st, L. A. Horback's Bell. Cockers.—*Dogs:* 1st, Dr. McBurney's Sport (Jet—Daisy). *Bitches:* 1st, W. Scott's Darling (Dandy—Daisy). *Puppies:* 1st, W. Scott's Flirt (Bengal—Darling). King Charles.—*Bitches:* 1st, C. H. Crosby's Lady; 2d, W. Scott's Veny. *Puppies:* 1st, C. H. Crosby's Duke (Duke—Lady). Blenheims.—*Puppies:* 1st, C. H. Crosby's Ruby.

GREYHOUNDS.—*Bitches:* 1st, George J. Gould's Duchess.

ITALIAN GREYHOUNDS.—*Dogs:* 1st, F. Remitti's Fly. *Bitches:* 1st, J. E. Hair's Poesy.

FOXHOUNDS.—*Dogs:* 1st, A. C. Hopkins's Cute (Spot—Kate). Very high com., E. D. Treadwell's Trump and Ethel. *Bitches:* 1st, W. Scott's Gipsy; 2d, A. C. Hopkins's Nellie (—— —Nina). *Puppies:* 1st, E. D. Treadwell's Trump; 2d, A. C. Hopkins's Topsy (Clinch—Nellie).

BEAGLES.—*Dogs:* 1st, H. Gray's Dot (Ringwood—Maida). *Bitches:* 1st, G. Laick's Cricket (Bugle—Pittsburg).

BLOODHOUNDS.—1st, C. Rau's Betsey.

BULL.—Scotch.—1st, J. Ellsworth's Schneider.

BULL-TERRIERS.—*Dogs:* 1st, M. Burns's Ned; 2d, E. D. Treadwell's Pilot (Ned—Nell). Very high com., I. D. Knapp's Adam Forepaugh. *Bitches:* 1st, M. Burns's Fanny. *Puppies:* M. Burns's Laurie B. (Crib—Lassy).

PUGS.—*Dogs:* 1st, Mrs. S. C. Barnum's Puck; 2d, W. Scott's Ned. *Bitches:* 1st, W. Scott's Twilight. *Puppies:* 1st, Diamond Kennels' Susie (Sir Henry—Lady Macbeth).

FOX-TERRIERS.—*Dogs:* 1st, W. Sargent's Jack (—— —Nellie); 2d, Mrs. S. C. Barnum's Spy. *Bitches:* 1st, withheld; 2d, W. Sargent's Gill (—— —Nellie). *Puppies:* 1st, T. D. Roberts's Dutchess (Totty—Gill).—Wire-Haired.—1st, A. and B. W. Bonney's Joco.

TOY TERRIERS.—Equal 1st, Miss Mamie E. Hopkins's Press and Dr. W. F. Lacey's Nannie.

YORKSHIRE TERRIERS.—*Dogs:* 1st, withheld; 2d, W. Scott's Pedro. *Bitches:* 1st, Mrs. Bergman's Nellie; 2d, W. Scott's Snip.

SKYE TERRIERS.—1st, A. W. Skiff's Ned.

POODLES.—1st, C. Rau's Poodle.

SPECIAL PRIZES.

Best kennel of setters, Blackstone Kennels, best setter with field trial record, Blackstone Kennels' Foreman, best English setter dog, Blackstone Kennels' Plantagenet; best bitch, Blackstone Kennels' Grace B. Best Irish setter dog, F. S. Parrott's Gerald; best bitch, F. S. Parrott's Rose of Killarney. Best greyhound bitch, George J. Gould's Dutchess. Best mastiff, Diamond Kennels' Tiger. Best Newfoundland, George W. Daton's Prince. D.

Danbury, Conn., Oct. 10.

THE STAFFORD DOG SHOW.

Editor Forest and Stream:

The second annual dog show of the Stafford Kennel Club, held in conjunction with the Stafford Agricultural Society, was held here last week. There were 117 dogs on exhibition, which is ahead of last year. The show of native dogs was very fine. On the last day of the fair there were over twelve thousand people present, and the dense crowds around the dogs is conclusive evidence that they were one of the most attractive features of the fair. Dr. George Walton, of Boston, Mass., filled the office of judge acceptably to all. It is the intention of the club to give a show next year, and no effort will be spared to make it as good as the best. The superintendent, Mr. Bissett, took excellent care of the dogs and his management gave general satisfaction. Following is a complete list of the

AWARDS.

POINTERS.—Under 50lbs.—1st, C. Eager's Don. Over 50lbs.—1st, George Buck's Tom.

SETTERS.—English.—1st, W. Purcell's Flora. Laverack.—1st, W. Larom's Teddy. Llewellin.—1st, H. M. Richards's Spot. Gordon.—1st, W. Peck's Nix. Irish.—1st, B. F. Root's Dan.

FOXHOUNDS.—1st, B. F. Root's Pete.

BEAGLES.—1st, M. Purcell's Spot.

COLLIES.—*Dogs:* 1st, H. A. Rindge's Bob. *Bitches:* 1st, J. W. Andrews's Nixie. *Puppies:* 1st, H. A. Rindge's pup.

NEWFOUNDLANDS.—1st, L. Converse's Major.

TERRIERS.—1st, L. Converse's Jack. Black and Tan.—1st, M. Conners's Fan. Bull-Terriers.—1st, R. S. Hicks's Max.

BULLDOGS.—1st, S. Hart's Sandy.

COCKER SPANIELS—1st, W. Smith's Fritz. *Puppies:* 1st, F. Sanger's May.

ST. BERNARDS.—1st, Chequasset Kennels' Hermit.

PUGS.—1st, Chequasset Kennels' ——. *Puppies:* 1st, Chequasset Kennels' ——.

DALMATIANS.—1st, V. E. Smith's Spot. S. S.

Stafford, Conn., Oct. 16.

BEAGLES AT PHILADELPHIA.

Editor Forest and Stream:

Regarding the disqualifying of my beagle Trailer (A.K.R. 2525) at the recent Philadelphia show, on the ground that he was over the limit in height, I am led to speak publicly, as I believe in the interest of beagle breeders and breeding.

The standard of the American-English Beagle Club, by which standard the beagles at the above show were judged, states that all beagles fifteen inches or under in height are eligible and all over fifteen inches ineligible.

My beagle Trailer was recently very carefully measured by one of the committee who made the above standard and he made him fourteen and three-quarter inches in height; he was also very carefully measured by Mr. O'Toole, Mr. E. Orgill's former kennel manager, at my request when I purchased him, he knowing that if there was any doubt about his being over fifteen inches I would not keep him, and he also made him fourteen and three-quarter inches, being the same measurement that I also made him. He was also set under a fifteen inch standard by other prominent and competent parties and considered under fifteen inches.

These measurements were all made with standards which the members of the committee who framed the standard tell me is the only proper way to measure a hound.

On the contrary Bannerman (whose owner entered him in a class for beagles over twelve inches and who was last spring very carefully measured by several competent parties at his request, all of whom made him over twelve inches) was transferred by the judges to the class for beagles under twelve inches. My only object in writing as above is merely to say that if breeders and exhibitors cannot with perfect safety show all beagles that are near the limit in size, or right up to the limit without running any risk whatever of being disqualified on the ground of height, then it is certainly time that the standard was raised sufficiently so that no legitimate sized (fifteen inch) beagles run any risk of being disqualified, which, certainly, is the greatest injustice which can be done an exhibitor, and by no means a small one after devoting weeks to preparing a dog for, and incurring the necessary expense of sending to a show.

Seriously speaking, it is better that ninety and nine guilty, over-sized hounds escape with prizes than that one innocent, legitimate-sized one and his owner suffer, and for that reason I emphatically assert that before disqualifying an entry for being under or over-sized a judge should exert the greatest carefulness and be absolutely positive he is committing no mistake whatever at the expense of the exhibitor. Having seen adverse statements in some of the reports of the above mentioned show regarding the care of dogs, I desire to add that my entries were promptly returned to me after the show, apparently in the best of health and in much better condition than I expected to find them, and not reduced at all in flesh, showing that they must have had as, one paper remarked, "plenty of good food and water." Herman F. Schellhass.

Brooklyn, N. Y.

THE COLLIE KENNEL PRIZE AT PHILADELPHIA.—At the recent Philadelphia dog show the special prize for the best kennel of five collies was awarded to the Sans Souci Kennels under the following circumstances: The regular classes were judged in the cattle shed between the two rows of benches. The Sans Souci Kennels entered five but had only four on exhibition at the time of judging both the regular classes and the special. Owing to the very bad arrangement for judging and the crowd of people in the shed, the judge, Mr. Apgar, suggested that the list of awards be examined, and if the case was clear, the trouble of taking the dogs off their benches in the crowd would be obviated. Both owners assented, and as the winnings showed that the Sans Souci Kennels were clearly ahead the prize was awarded to them. Shortly after the award Mr. Lindsay, the only other competitor, discovered that So So, one of the Sans Souci Kennels' entries, was absent. He at once applied to the steward, and finding that the entry was marked absent in the steward's book, he protested the award on the ground that a prize for five dogs could not be awarded to four. The club took nearly two weeks instead of five minutes to consider the matter, and have finally sustained the protest; and the prize will go to Mr. Lindsay's Kennels. It was the duty of the judge to have seen each dog entered; this would have effectually blocked the little game. Had the management been reasonably good and a proper place provided for the judging, this loophole for fraud to creep in would not have been open. More than all, it was the plain duty of the owner of the Sans Souci Kennels to have practiced common honesty in this case, and not to have taken by fraud a prize that belonged to another. The Sans Souci have scored an unenviable record, which future show managers will do well to keep track of.

DEATH OF CHAMPION PETREL.—The well-known English setter Petrel is dead. Although winning champion prizes both in England and this country, she is best known as the dam of champions, no less than three of her progeny having won the title Gladstone, Plantagenet and Petrel II., and all of them are by different sires. She was also the dam of many other prize winners, but her fame rests upon a more lasting foundation than this. She was not only the dam of good-looking, well-formed animals, but of first-class field performers as well. Those who have been so fortunate as to witness the work of Gladstone, Plantagenet, Prince, Warwick, Ollie, and many others of her progeny, will agree with us in bestowing upon her the well deserved title of the Queen of Setters.

ST. MAURICE.—Newark, N. J., Oct. 16.—*Editor Forest and Stream:* Allow me to protest against the sweeping assertion made in the critique of the Philadelphia bench show that St. Maurice is not a St. Bernard. He is as thorough bred a St. Bernard as ever crossed the Atlantic, as his pedigree will show. I know both sire and dam; both are prize winners in Switzerland and entered in the Swiss Stud Book. Only prize dogs and their get can be registered in Switzerland, and the latter only after they are twelve months old and after having been approved by the stud book committee. St. Maurice was the pick of the litter out of Mina (S. S. B. 11; breeder, the baroness of Grafenried) by Mr. Fahrni's Lebeau (S. S. B.5), and was selected on account of his markings and size; but because his color is of a very dark brindle and white, that does not make him a "Landseer" Newfoundland, just as little as the light tawny color will make a St. Bernard a Leonberg dog. Old Barry, for instance, as preserved at the Museum at Berne, had a coat of a mixture of light and dark brindle and white; and if a dog is to be ruled out on account of his not being of the usual red or red and white, we might as well discard Old Barry as being the most worthy representative of his noble breed. There are other points, equally as important as the color, if not more so, which distinguish the St. Bernard from the Newfoundland or Leonberg, for whereas the color differs in the various strains, all other points remain the same for the breed as a whole. St. Maurice was entered as "very dark brindle and white," but in the catalogue the words "very dark" were omitted. If the critic had seen the dog in the open air or taken the trouble to examine him more closely, he would have seen that the dog is not black and white. The standard of the English St. Bernard Club says, "no pure black and white," and so says the Swiss Kynological Society, of which I am a member. If St. Maurice were black and white, I would certainly never have attempted to exhibit him. As I do know the difference between a St. Bernard and a Newfoundland, even a black and white one, and as my reputation is brought into question, I cannot pass the assertion referred to unnoticed. The dogs were undoubtedly shown to great disadvantage in those dark cattle sheds, but Mr. Dudley, who saw the dog in the judging ring, certainly knew what he was doing when he awarded St. Maurice a c. in the open class and an hc. in the puppy class, the critic's statement to the contrary notwithstanding. I shall consider it a great favor if you will kindly publish this letter in your next issue.—K. E. Hopf. ["A man who will not stand up for his dog is just no man at all." Mr. Hopf vindicates himself in this respect, but has failed to convince us that the color of St. Maurice is orthodox, although he kindly brought the dog to our office on Tuesday for inspection. We must admit that a considerable portion of the dark color would pass for dark brindle, but it is a very, very dark brindle, and was not readily to be seen in the bad light at Philadelphia. There is, however, quite a patch of solid black on his shoulders, and when his owner will show that the Kynological Society does not disqualify a dog for this fault, we will humbly beg his and St. Maurice's pardon.

RED IRISH SETTER CLUB.—Bridgeport, Ct., Oct. 17.—*Editor Forest and Stream:* I beg to announce that several of the Irish setter breeders are getting up a special cash prize for the best Irish setter in the all-aged setter stake of the Eastern Field Trials. It is not yet known how much it will amount to—probably $100, if not more. It is intended to organize an Irish setter club next spring—in fact, the knot of breeders who are interested in this special may be called a club, though not regularly organized yet; and this is their initiative step toward the improvement of the breed in field form. The competition will be warm, for I know of several good reds that will start if there is a special.—Luke W. White (Acting Secretary and Treasurer).

PRINCE CHARLES SPANIELS.—Boston, Oct. 15.—*Editor Forest and Stream:* In your paper of May 21, in the report of the Toronto dog show, I noticed that the toy spaniel class was divided for King Charles and Prince Charles spaniels. What is a Prince Charles spaniel? I have been breeding and dealing in all kinds of dogs for thirty-nine years, and I most willingly confess that I do not know what a Prince Charles spaniel is. I know you will put your readers on the right track.—Dr. G. Walton. [A King Charles spaniel is black and tan, a Blenheim spaniel is white and red, and a Prince Charles spaniel is white, black and tan. The build of each breed is the same; the only difference is in color and marking.]

PHILADELPHIA KENNEL CLUB FIELD TRIALS.—The second annual field trials of the Philadelphia Kennel Club will be run at Rio Grande, N. J., commencing Nov. 17. The trials are for members only. The entries close Nov. 1. Mr. C. S. Westcott has been selected as judge.

THE WINSTED DOG SHOW.—The Western Connecticut Poultry, Pigeon and Pet Stock Association will hold a dog show in connection with their first exhibition, at Winsted, Ct., on Dec. 15 to 18. The superintendent is Frank D. Hallett, Winsted, Ct.

THE PACIFIC COAST FIELD TRIALS.—The entries for the All-Aged Stake of the Pacific Coast Field Trials Club will close on Nov. 15, $2.50 at time of nomination with $5 additional to start. The secretary is H. C. Brown, Sacramento, Cal.

POINTER LOST.—Strayed or stolen from 178 South Fifth street, Brooklyn, N. Y., a white pointer bitch with lemon ears. Any information regarding her will be thankfully received at the above address.

KENNEL NOTES.

KENNEL NOTE BLANKS.

For the convenience of breeders we have prepared a series of blanks for "Names Claimed," "Whelps," "Bred" and "Sales." We request that all Kennel Notes be sent to us on these blanks, which will be forwarded to any address on receipt of stamped and directed envelope. Send for a set of them.

NAMES CLAIMED.

Rocky Glen. By E. W. Jester, St. George's, Del., for blue belton English setter dog, whelped Aug. 16, 1885, by Glen Rock (A.K.R. 1616) out of Dashing Belle (Dashing Monarch—Blue Belle.)

Little Boy Blue. By E. W. Jester, for blue belton English setter dog, whelped Aug. 16, 1885, by Glen Rock (A.K.R 1616) out of Dashing Belle (Dashing Monarch—Blue Belle).

Glen Chester. By E. W. Jester, for blue belton English setter dog, whelped Aug. 16, 1885, by Glen Rock (A.K.R. 1616) out of Dashing Belle (Dashing Monarch—Blue Belle).

Glen Duke. By E. W. Jester, for blue belton English setter dog, whelped Aug. 16, 1885, by Glen Rock (A.K.R. 1616) out of Dashing Belle (Dashing Monarch—Blue Belle).

Glen Roy. By E. W. Jester, for blue belton English setter dog, whelped Aug. 16, 1885, by Glen Rock (A.K.R. 1616) out of Dashing Belle (Dashing Monarch—Blue Belle).

Glen Nettie. By E. W. Jester, for lemon belton English setter bitch, whelped Aug. 16, 1885, by Glen Rock (A.K.R. 1616) out of Dashing Belle (Dashing Monarch—Blue Belle).

Glen Chief. By E. W. Jester, for blue belton English setter dog, whelped Aug. 28, 1885, by Glen Rock (A.K.R. 1616) out of Dashing Jest (Dashing Monarch—Blue Belle).

Glen Mina. By E. W. Jester, for blue belton English setter bitch, whelped Aug. 28, 1885, by Glen Rock (A.K.R. 1616) out of Dashing Jest (Dashing Monarch—Blue Belle).

Glen Mona. By E. W. Jester, for blue belton English setter bitch, whelped Aug. 28, 1885, by Glen Rock (A.K.R. 1616) out of Dashing Jest (Dashing Monarch—Blue Belle).

Glen Luna. By E. W. Jester, for blue belton English setter bitch, whelped Aug. 28, 1885, by Glen Rock (A.K.R. 1616) our of Dashing Jest (Dashing Monarch—Blue Belle).

Glen Flirt. By E. W. Jester, for blue belton English setter bitch, whelped June 9, 1885, by Glen Rock (A.K.R. 1616) out of Countess Flirt (Tempest—Flirt).

Glen Countess. By E. W. Jester, for blue belton English setter bitch, whelped June 9, 1885, by Glen Rock (A.K.R. 1616) out of Countess Flirt (Tempest—Flirt).

Aunty Fuller. By E. W. Jester, for lemon belton English setter bitch, whelped June 9, 1885, by Glen Rock (A.K.R. 1616) out of Countess Flirt (Tempest—Flirt).

Glen Lea. By E. W. Jester, for black, white and tan English setter dog, whelped July 18, 1885, by Glen Rock (A.K.R. 1616) out of Leah II. Royal Duke—Leah).

Glynn. By Wm. Nightengale, Brunswick, Ga., for black, white and an English setter dog, whelped March 31, 1885, by Count Noble (Count Wind'em—Nora) out of Belle Boyd (A.K.R. 1277).

Duke. By Philip E. Rogers, Hyde Park, N. Y., for white and black ticked English setter dog, whelped November, 1884, by Perfection A.K.R. 826) out of Beauty (A.K.R. 806).

Rattler. By Jos. E. Lord, Gildersleeve, Conn., for white and black beagle hound dog, whelped May 21, 1885, by Bannerman (A.K.R. 1709) out of White Daisy (A.K.R. 1723).

Snow Flake. By Jos. E. Lord, Gildersleeve, Conn., for white beagle hound bitch, whelped May 21, 1885, by Bannerman (A.K.R. 1709) out of White Daisy (A.K.R. 1723).

Lenore. By W. S. Haines, Wilmington, Del., for chestnut, white and tan English setter bitch, whelped July 10, 1885, by Don Juan (Tam O'Shanter—La Reine) out of Petrel III. (Carlowitz—Petrel).

Thaddeus, Jack, Jr., Ohele and Don. By Harry A. Fletcher, Portland, Me., for red Irish setter dogs, whelped Aug. 1, 1885, by Jack (Elcho—Mag) out of Meg Merrilies (A.K.R. 2181).

Vera, Siada and Princess. By Harry A. Fletcher, Portland, Me., or red Irish setter bitches, whelped Aug. 1, 1885, by Jack (Elcho—Mag) out of Meg Merrilies (A.K.R. 2181).

Bizoresna. By Berkshire Kennels, Pittsfield, Mass., for red Irish setter bitch, whelped Aug. 28, 1885, by Nimrod (A.K.R. 631) out of Bizorah (A.K.R. 1238).

Donald III. By S. F. Chase, East Haverhill, Mass., for liver and white pointer dog, whelped June 29, 1885, by Donald II. (A.K.R. 2545) out of Lady Bang (A.K.R. 698).

Towler, Growler, Lu Lu and Sanco. By H. Jackson, Dover, N. H., for black, white and tan beagles, two dogs and two bitches, whelped July, 1885 (Spider—Flirt II.).

Forward, Foremost, Foreman's Lass, Folderol, Fortuna and Foam. By Blackstone Kennels, South Attleboro, Mass., for white, black and tan English setters, two dogs and four bitches, whelped Aug. 7, 1885, by their champion Foreman out of their Grace B. (London—Dawn).

Dashing Jennie Dale. By F. J. Frost, Toledo, O., for orange and white English setter bitch, whelped May 11, 1884, by Dashing Berwyn (Dash II.—Countess Bear) out of Romp Dale (Grouse—Daisy Dale).

Mikado. By W. W. Tucker, New York, for St. Bernard dog, age, color and pedigree not given.

Benedict. By Acadia Kennels, Boston, Mass., for black Newfoundland dog, whelped June 7, 1885, by Jalma (Jack—Moll) out of Fly (A.K.R. 553).

Le Blanc. By Acadia Kennels, Boston, Mass., for black Newfoundland dog, whelped June 7, 1885, by Jalma (Jack—Moll) out of Fly (A.K.R. 553).

Felician. By Acadia Kennels, Boston, Mass., for black Newfoundland dog, whelped June 7, 1885, by Jalma (Jack—Moll) out of Fly (A.K.R. 553).

Gabriel. By Acadia Kennels, Boston, Mass., for black Newfoundland dog, whelped June 7, 1885, by Jalma (Jack—Moll) out of Fly (A.K.R. 553).

Basil. By Acadia Kennels, Boston, Mass., for black Newfoundland dog, whelped June 7, 1885, by Jalma (Jack—Moll) out of Fly (A.K.R. 553).

Early Dawn. By John K. Yore, St. Louis, Mo., for sable collie, whelped April 16, 1885, by Rob Rob (A.K.R. 334) out of imported Fanny.

Montana. By Forest City Kennels, Cleveland, O., for black, white and tan English setter dog, whelped July, 1884 (Sam Tilden—Floy).

Count Philip. By Forest City Kennels, Cleveland, O., for black, white and tan English setter dog, whelped June 11, 1883 (Count Noble—Floy).

Guy and Miss Munnie. By Forest City Kennels, Cleveland, O., for black, white and tan English setters, dog and bitch, whelped June 8, 1885 (Plantagenet—Floy).

Haines' Chief. By J. A. Cathcart, Atlantic City, N. J., for red Irish setter dog, whelped Sept. 11, 1885, by Chief (A.K.R. 231) out of Lady Bess (A.K.R. 2178).

Herzog, Princess Olga and Princess Leonore. By Wm. Loeffler, Preston, Minn., for dachshunde, black and tan dog, red, and black and tan bitches, whelped June 8, 1885, by his Waldmann II. (Faust—Flora) out of his Juliette (Unser Fritz—Waldine).

Witch and Cesar. By Wm. Loeffler, Preston, Minn., for silver and tan and black and tan dachshund dogs, whelped Sept. 25, 1885, by his Waldmann II. (Faust—Flora) out of his Babette (Bock—Waldine).

Nip and Tug. By Wm. Loeffler, Preston, Minn., for red and black and tan dachshund dogs, whelped July, 1885, by his Waldmann II. (Faust—Flora) out of Gretchen (Unser Fritz—Waldine).

Count Noble II. and Fleet Spier. By A. T. Plummer, New York, for orange belton and black, white and tan English setter dogs, whelped July 29, 1885, by Count Noble (Count Wind'em—Norna) out of Ruby (Rake—Fanny).

Forest City Kennels. By Dalliba, Billings & Munhall, Cleveland, O., for their kennels of setters and pointers.

St. George's Kennels. By E. W. Jester, for his kennels at St. George's, Del.

BRED.

Ruth—Glen Rock. E. W. Jester's (St. George's, Del.) English setter bitch Ruth (Prince—Ruby) to his Glen Rock (A.K.R. 1616), Sept. 23.

Little Nell—The Earl. F. F. Dole's (New Haven, Conn.) bull-terrier bitch Little Nell (Paddy— ———) to his The Earl (Marquis—Lady), Oct. 6.

Lorna Doon—Nemo. Dr. G. P. Davis's (New Haven, Conn.) red Irish setter bitch Lorna Doone (A.K.R. 1965) to L. G. Chapman's Nemo (Red—Maud), Sept. 12.

Walkil Chloe—Obo II. A. Gordon's (Middletown, N. Y.) cocker spaniel bitch Walkil Chloe (Obo, Jr.—Chloe) to Obo II. (A.K.R. 432), Sept. 26.

Belle—Graphic. W. T. Mitchell's (Lynch's, Va.) pointer bitch Belle (Sensation—Lill) to James L. Anthony's Graphic (A.K.R. 2111), Oct. 8.

Lyda Belle—Nimrod. E. A. Starkey's (Brattleboro, Vt.) red Irish setter bitch Lyda Belle (A.K.R. 626) to Nimrod (A.K.R. 631), Sept. 7.

Mischief—Little Duke. Jos. N. Brady's (Pawtucket, R. I.) English beagle bitch Mischief (A.K.R. 2592) to A. H. Wakefield & Co.'s Little Duke (A.K.R. 1994).

Belle of Bryn Mawr—Prince Napoleon. F. C. Sayles, Jr.'s (Pawtucket, R. I.) English setter bitch Belle of Bryn Mawr (A.K.R. 2651) to T. H. Adams's Prince Napoleon (A.K.R. 2671), Sept. 21.

Jeannie Nettles—Roy Boy. Jas. Lindsay's (Jersey City, N. J.) collie bitch Jeannie Nettles (A.K.R. 1224) to Associated Fanciers' Roy Boy (Roy—Lassie), Oct. 9.

Nellie—Rex. J. Van Horne's (Jersey City, N. J.) collie bitch Nellie (Ayreshire Laddie—Lassie) to J. Lindsay's Rex (A.K.R. 149), Oct. 4.

Juno II.—Rex. A. R. Kyle's (Stamford, Conn.) collie bitch Juno II. to Jas. Lindsay's Rex (A.K.R. 149), Sept. 8.

Fly—Sam. Acadia Kennels' (Boston, Mass.) Newfoundland bitch Fly (A.K.R. 553) to their champion Sam (A.K.R. 556), Oct. 1.

Black Pearl—Hornell Silk. Nickerson & Grosvenor's (Boston, Mass.) cocker spaniel bitch Black Pearl (A.K.R. 647) to Hornell Spaniel Club's Hornell Silk (A.K.R. 1397), Aug. 20.

Little Nell—Dutch, Jr. T. R. Varick's (Manchester, N. H.) bull-terier bitch Little Nell to his Dutch, Jr. (Dutch—Nell), Sept. 19.

Nixie—Turk. G. A. Schafer's (Philadelphia, Pa.) Gordon setter bitch Nixie (Bob—Nell) to H. C. Glover's champion Turk (A.K.R. 717), Oct. 9.

Crawl—Waldmann II. Wm. Loeffler's (Preston, Minn.) dachshund bitch Crawl (Waldmann—Waldine) to his Waldmann II. (Faust—Flora), Sept. 29.

Congo—Waldmann II, Wm. Loeffler's (Preston, Minn.) dachshund bitch Congo (Scamp—Thora) to his Waldmann II. (Faust—Flora), Oct. 13.

WHELPS.

Judy. W. F. Reynolds's (Poughkeepsie, N. Y.) Irish setter bitch Judy (A.K.R. 2199), Oct. 4, five (two dogs), by his Garry (A.K.R. 2198).

Rose. Geo. Vaughan's (New Haven, Conn.) bull-terrier bitch Rose, Oct. 3, six (two dogs), by Frank F. Dole's The Earl (Marquis—Lady).

Brimstone. W. A. Coster's (Flatbush, L. I.) English setter bitch Brimstone (A.K.R. 29), June 28, eight (five dogs), by his Buckellew (A.K.R. 30).

Tuck. G. F. Jordan's (Philadelphia, Pa.) pointer bitch Tuck (Garnet—Doxey), Sept. 19, six (five dogs), by his Nip (Lake—Juno); all liver and white.

Carlotta. Arthur E. Rendle's (New York) cocker spaniel bitch Carlotta (Black Charlie—Frolic), Oct. 17, eight (four dogs), by his champion Brahmin.

Prue. F. C. Moore's (Ashtabula, O.) English setter bitch Prue (Perfection—Beauty), Sept. 11, three dogs, by W. Fischer's Pride of Dixie (Gladstone—Countess Druid).

Babette. Wm. Loeffler's (Preston, Minn.) dachshund bitch Babette (Bock—Waldine), Sept. 25, two (one dog), by his Waldmann II. (Faust—Flora).

Erie. H. F. Rivers's (Bridgeport, Conn.) pointer bitch Erie (Rake II.—Browny), Oct. 5, fourteen, by F. R. Hitchcock's Tammany (Tory—Moonstone); nine liver and white and five lemon and white.

ERIE—TAMMANY.—*Editor Forest and Stream:* Regarding the claim of Luke White and Geo. Macdougall that Bang Grace served my bitch Erie, I wish to affirm what I said of the matter in your issue of Aug. 20. I also wrote you later, although you did not publish it, that the color of the puppies would determine that Tammany was the sire. Erie whelped Oct. 5 nine liver and white and five lemon and white puppies, and I will let the readers of FOREST AND STREAM judge whether Bang Grace or Tammany is the sire. Both Erie and Bang Grace are lemon and white and Tammany is liver and white—H. F. RIVERS (Bridgeport, Conn., Oct. 12).

SALES.

Glen Roy. Blue belton English setter dog, whelped Aug. 16, 1885 (Glen Rock—Dashing Belle), by E. W. Jester, St. George's, Del., to W. F. Streeter, Lehigh Tannery, Pa.

Rock. Lemon and white beagle dog, 1yr. old, pedigree unknown, by E. W. Jester to Associated Fanciers, Philadelphia, Pa.

Lead. Black, white and tan beagle dog, age and pedigree unknown, by E. W. Jester to Associated Fanciers, Philadelphia, Pa.

Rye. Lemon and white beagle bitch, 1yr. old, pedigree unknown, by E. W. Jester to Associated Fanciers, Philadelphia, Pa.

Lady. Black, white and tan beagle bitch, age and pedigree unknown, by E. W. Jester to Associated Fanciers, Philadelphia, Pa.

Bugle. Lemon and white beagle dog, whelped Aug. 5, 1884 (Lead—Fanny), by E. W. Jester to Associated Fanciers, Philadelphia, Pa.

Fanny. Black, white and tan beagle bitch, age and pedigree unknown, by E. W. Jester to Associated Fanciers, Philadelphia, Pa.

Little Lady. Black white and tan beagle bitch, age and pedigree unknown, by E. W. Jester to Associated Fanciers, Philadelphia, Pa.

Boler. Black and white foxhound dog, age and pedigree unknown, by E. W. Jester to Associated Fanciers, Philadelphia, Pa.

Lulu. Black and tan foxhound bitch, age and pedigree unknown, by E. W. Jester to Associated Fanciers, Philadelphia, Pa.

Shep. Tawny and white collie dog, whelped Aug. 29, 1885 (——— Friday), by E. W. Jester to Isaac Wilson, Angora, Pa.

Glen Countess. Blue belton English setter bitch, whelped June 9, 1885 (Glen Rock—Countess Flirt), by E. W. Jester to W. H. Colcord, Chicago, Ill.

Scarlet III. White bull-terrier bitch, whelped Jan. 12, 1884 (Young Royal—Scarlet II.), by Frank F. Dole, New Haven, Conn., to Chas. A. Stevens, Hoboken, N. J.

Don. Red Irish setter dog, whelped Aug. 1, 1885 (Jack—Meg Merrilies), by Harry A. Fletcher, Portland, Me., to Chas. A. S. Holland, same place.

Thaddeus. Red Irish setter dog, whelped Aug. 1, 1885 (Jack—Meg Merrilies), by Harry A. Fletcher, Portland, Me., to Wm. H. H. Saunders, same place.

Jack, Jr. Red Irish setter dog, whelped Aug. 1, 1885 (Jack—Meg Merrilies), by Harry A. Fletcher, Portland, Me., to John E. Palmer, same place.

Vera. Red Irish setter bitch, whelped Aug. 1, 1885 (Jack—Meg Merrilies), by Harry A. Fletcher, Portland, Me., to D. M. Holman, Boston, Mass.

Princess. Red Irish setter bitch, whelped Aug. 1, 1885 (Jack—Meg Merrilies), by Harry A. Fletcher, Portland, Me., to M. P. Dalton, Deering, Me.

Daisy Bravo. Lemon and white pointer bitch (A.K.R. 560), by Geo. Norbury Appold, Baltimore, Md., to Clifton Kennels, Jersey City, N. J.

Ruby Buckellew. Orange and white English setter bitch, whelped June 23, 1885 (Buckellew—Brimstone), by W. A. Coster, Flatbush, L. I., to T. W. Stoutenburg, St. Louis, Mo.

Buckshot. Orange and white English setter dog, whelped June 28, 1885 (Buckellew—Brimstone), by W. A. Coster, Flatbush, L. I., to John W. Frye, South Oil City, Pa.

Buck's Lad. Orange and white English setter dog, whelped June 28, 1885 (Buckellew—Brimstone), by W. A. Coster, Flatbush, L. I., to Wm. S. Smith, same place.

Blarney Stone. Orange and white English setter dog, whelped June 28, 1885 (Buckellew—Brimstone), by W. A. Coster, Flatbush, L. I., to Thos. C. Abbott, Yardville, N. J.

Foremost. White, black and tan English setter dog, whelped Aug. 7, 1885 (Foreman—Grace B.), by Blackstone Kennels, South Attleboro, Mass., to Chas. Coupland, Seymour, Conn.

Black Prince (A.K.R. 62)—Marion (A.K.R. 2689) whelps. Black spaniel bitches, whelped July 21, 1885, by A. C. Wilmerding, New York, one each to Albert E. Foster, Alex. Taylor, Jr., and Dr. J. W. Greene, same place; one to H. J. Bennet, Trenton, N. J., and one to L. A. Biddle, Philadelphia, Pa.

Sport—Suwanee whelps. Spaniel dogs, whelped July 15, 1885, by A. C. Wilmerding, New York, one to Dr. Charles McBurney, same place, and one to H. J. Bennet, Trenton, N. J.

Snyder—Dixie whelps. Beagles, whelped July 29, 1885, by S. L. Farrar, Bath, Me., one dog each to James Purrington, S. H. Rogers, Chas. Boyd, and a bitch to J. H. Jordan, same place, and a dog to Wm. E. Walker, Taunton, Mass.

Marcus II. Black, white and tan collie dog, whelped Nov. 4, 1884, by Rex (A.K.R. 149) out of Jersey Lily (A.K.R. 147), by Jas. Lindsay, Jersey City, N. J., to Gifford F. Parker, Newark, N. J.

Dot. Black, white and tan collie bitch, whelped Nov. 4, 1884, by Rex (A.K.R. 149) out of Jersey Lily (A.K.R. 149), by James Lindsay, Jersey City, N. J., to Mitchell Harrison, Philadelphia, Pa.

Gem. Sable and white collie bitch, whelped July 12, 1884, by Brack (A.K.R. 3) out of Fairy (A.K.R. 1222), by James Lindsay, Jersey City, N. J., to Mitchell Harrison, Philadelphia, Pa.

Portland. Black, tan and white collie dog, whelped Nov. 4, 1884, by Rex (A.K.R. 149) out of Jersey Lily (A.K.R. 147), by James Lindsay, Jersey City, N. S., to Allen Thorndike Rice, New York.

Basil. Black Newfoundland dog, whelped June 7, 1885 (Jalma—Fly), by Acadia Kennels, Boston, Boston, Mass., to F. H. Scribner, New York.

Felician. Black Newfoundland dog, whelped June 7, 1885 (Jalma—Fly), by Acadia Kennels, Boston, Mass., to J. C. Williams, West Dedham, Mass.

Le Blanc. Black Newfoundland dog, whelped June 7, 1885 (Jalma—Fly), by Acadia Kennels, Boston, Mass., to P. J. Donahue, New York.

Benedict. Black Newfoundland dog, whelped June 7, 1885 (Jalma—Fly), by Acadia Kennels, Boston, Mass., to B. Maguire, same place.

Black Pearl. Black cocker spaniel bitch, whelped Aug. 28, 1883 (A.K.R. 647), by Geo. W. Leavitt, Boston, Mass., to J. A. Nickerson and Dr. Provencar, same place.

Count Noble—Ruby whelp. Liver, white and tan English setter bitch, whelped July 29, 1885, by H. C. Hamilton, New York, to W. B. Dickerman, same place.

Blanche. Chestnut and tan dachshund bitch, whelped May 21, 1885 (Waldmann—Congo), by Wm. Loeffler, Preston, Minn., to Fred Segmund, Washington, Mo.

Faust II. Red dachshund dog, whelped April 21, 1885 (Bergmann—Diana), by Wm. Loeffler, Preston, Minn., to Dr. Chase, Viroqua, Wis.

Herod and Alice. Red dachshund dog and black and tan bitch, whelped July, 1885 (Waldmann II.—Gretchen), by Wm. Loeffler, Preston, Minn., to L. Harris, Rock Island, Ill.

Diana. Black and tan dachshund bitch (Waldmann II.—Babette), by Wm. Loeffler, Preston, Minn., to F. Howard, Irvington, N. Y.

Ruby Tyrant—Warren Lady whelps. White, black and tan fox-terriers, whelped July 23, 1885, by Wm. T. McAleer, Philadelphia, Pa.; a dog to H. Graham, Jr., Chester, Pa.; a dog to J. B. Downs, Dauphin, Pa., and a bitch to W. H. Herberton, Philadelphia, Pa.

Otto. Red dachshund dog, whelped April 13, 1885 (Waldmann—Crawl), by Wm. Loeffler, Preston, Minn., to L. A. Shaw, Newton Center, Mass.

Beatrice and Thora II. Black and tan and red dachshund bitches, whelped May 21, 1885 (Waldmann—Congo), by Wm. Loeffler, Preston, Minn., to L. A. Shaw, Newton Center, Mass.

Crook. Red dachshund dog, whelped April 21, 1885 (Bergmann—Diana), by Wm. Loeffler, Preston, Minn., to Fred Segmund, Washington, Mo.

PRESENTATIONS.

Glynn. Black, white and tan English setter dog, whelped March 31, 1885 (Count Noble—Belle Boyd), by A. J. Crovatt, Brunswick, Ga., to William Nightengale, same place.

IMPORTATIONS.

Flotsam and Jetsam. Black pointer bitches, whelped April 8, 1883 (Sambo—Diana), by Howard Hartley, Pittsburgh, Pa., from Kendal, Eng., Oct. 10.

Ilse.—*Editor Forest and Stream:* In to-day's issue of FOREST AND STREAM I find under the Kennel list of importations my St. Bernard bitch called Isle. This is a mistake, the name is Ilse. Please correct.—RICHARD H. DERBY.

KENNEL MANAGEMENT.

No Notice Taken of Anonymous Correspondents.

G. L. D., Middleburgh, N. Y.—A pointer 3½ years old, about a year ago showed sores between his toes, hard and occasionally discharging a whitish fluid. Lately on the elbow joints of his hind legs the skin has thickened; scabs appear, and a thickish dark matter discharges under pressure. On his front legs at the elbows the skin ridges and thickens and scabs and matter appear. The dog appears chilly and though he will hunt, soon tires. On the body the skin is all right, and even on the sores the hair don't fall out much. Ans. Your dog suffers from a skin disease called psoriasis. Have your druggist make you a five per cent. solution of salicylic acid in castor oil, and apply twice daily with a camel's hair brush. Remove the scabs as soon as they are softened. Keep the bowels open with castor oil or syrup of buckthorn in teaspoonful doses.

D., Oneida, N. Y.—My spaniel, six months old, after apparently recovering from distemper, has been seized with pain in his head and eyes. His eyes have become inflamed and seem to spread apart; are very sensitive to light, lids swollen, no noticeable discharge. He rubs his head a great deal and keeps his eyes closed. Have been treating him for distemper under FOREST AND STREAM'S directions, but he does not seem to improve. Seems to suffer great pain in his head at times. Eats well at times, but nothing at others. Has a good deal of fever. Please advise me what to do for him. Ans. Keep your dog in a dry, warm room or kennel. Change the bedding twice weekly. Disinfect the kennel twice a week with chloride of lime solution or with weak solution of acid carbolic. While fever exists give three drops of tincture of aconite every two hours until it is under control. Keep the bowels easy with syrup of buckthorn in teaspoonful doses two or three times daily. If the eyelids are still inflamed and there is fear of light, drop into them three times daily a few drops of zinc sulphocarbolate solution of the strength of two grains to the ounce of distilled water. Feed on unstimulating diet, soups without fat, mush with a very little raw minced meat mixed with it, etc. As soon as the fever abates and convalescence is established, give drops of the tincture of the chloride of iron three times daily in a wine glass of sweetened water. Report results.

C. L. P., N. Y.—A terrier dog, 2½ years old, is attacked with some malady of which the following symptoms are most apparent: He crouches down on his forefeet, with his head resting on them and his hind parts elevated, which position seems to ease him; then he will curl up and after a few seconds he will straighten up and howl as if in great pain. I used the areca nut recipe (thinking he had worms), but it did not relieve him. I also treated him for cramps, but with no success. After suffering two or three days he will come around again all right until attacked again. Ans. Your dog has intestinal colic. There are many causes for the trouble. You do not speak of his passages. If he has diarrhœa it is probably due to some indigestible food taken in. He may have peritonitis, in which case there would be distension of the abdomen. It may be neuralgia from cold, etc. If he has diarrhœa, or you suspect that he has eaten some indigestible substances, you must purge him with a full dose of castor oil (dessert spoonful), and then give a powder containing ten grains of subnitrate of bismuth and one grain of opium. Give the powder daily until relief is obtained. If the dog does not improve write again, giving fuller particulars as to condition of bowels and stomach, and tell us whether the dog has fever.

Rifle and Tray Shooting.

GARDNER, Mass., Oct. 16.—At the last meet of the members of the Gardner Rifle Club at Hackmatack Range to-day, the inch-ring target was used, distance 200yds., shooting off-hand, with a possible 100. The results of two strings was as follows:

A Mathews	93	95—191	George Warfield	51	62—113
F E Nichol	86	98—184	C J Crabtree	50	61—111
H C Knowlton	78	81—159			
			At Rest.		
William Austin				82	96—178

STUDYING AMERICAN ARMS.—Lieutenant Colonel George Vincent Fosbery, of the British war office, is in America engaged in studying the American methods of manufacturing magazine guns and small arms. Colonel Fosbery if not here officially, but upon his own account. He has served with brilliancy in Afghan border wars under General Chamberlain and has won the Victoria cross. He is also the first outsider who saw the mitrailleuse that Louis Napoleon had so carefully, and to so little effect just before the Franco Prussian war. As a close observer he has been to many countries to secure facts about ordnance, magazine guns and small arms. In ordnance he thinks the United States cannot compare with England, for we have no large gun foundries, but in magazine guns we are superior. The Gatling with its automatic feed he places at the head of the list. The Gardner is also highly thought of. Pratt & Whitney's arms have long been favorably known in England. Save one, there is no shop in Great Britain, he says, capable of turning out such good work.

BOSTON, Oct. 13.—The Boston press boys had a field day on the range at Walnut Hill in the 7th annual competition. The team match resulted for the fourth time in a victory for the *Herald*'s marksmen. The *Herald* won the medals the first three years after organization, the *Globe* in each of the succeeding three years, and now the *Herald* is again at the fore. The weather was decidedly inauspicious. A provoking east wind, variable and puffy, accompanied by intermittent showers and changing lights, rendered frequent changes in the wind gauges and the sights necessary. The scores stood:

A SEVERE REPRIMAND.—Lieut. W. H. Crossman, of Co. E, 7th regiment, was disqualified by the directors of the N. R. A. from shooting on the Creedmoor range, under charge of bribery to a scorer on the 8d inst., while engaged in regimental practice at the range. He has resigned from his regiment, but carries with him the confidence of his brother officers in the question of veracity between the shooter and the scorer.

BRATTLEBORO, Vt., Oct. 17.—The Brattleboro Rifle Club allows no sighting shots, each contestant must start his score with his first off-hand shot, this puts the boys on their nerve at the very first. Mr. Cobb has a firm hold on the medal, his score of 114 is the best yet made on the range in the first 10 shots of the day. The following is the score for 200yds., Massachusetts target, 10 shots each:

Record Match.

Cobb	12	12	11	10	11	12	11	12	12	11—114

Next week the club will give a trial to the Farrow target, as described in the FOREST AND STREAM of Oct. 8.

BOSTON, Oct. 17.—There was a smaller attendance of riflemen than usual at the meeting of the Massachusetts Rifle Association at Walnut Hill to-day. During the early part of the day there was a moderate wind, but a most perplexing mirage, which even at the 200yds. range proved most delusive. At 4 o'clock the mirage disappeared, the wind calmed and the conditions were almost perfect. J. N. Frye scored 100 out of a possible 100 in the rest match. This was the fourth time the feat has been performed in a match. The 10 shots were all inside of the 10 circle of 3½in. in diameter, not one touching the circle line. M. C. Daulton, Company M, Eighth Regiment, in a short space of time, recorded 4 scores of 22, 22, 22, 23, out of a possible 25, winning the silver badge in the Massachusetts militia match. The details of the day's work were as follows:

Creedmoor Match.

L Herbert (mil.)	4544443554—43	L Barton (mil.)	4355334344—38

"PROBABLY THE LAST APPEARANCE."

Editor Forest and Stream:

Am I right in supposing a cutter to be a single-masted vessel with loose-footed mainsail, jib set flying and a running bowsprit? If so, why do you not give your readers a hint to that effect and stop some of the talk about cutter and sloop? As to the Puritan, in rig she is neither a sloop nor a cutter; and if being designed, built and sailed by Americans can make any vessel American, then surely the Puritan is American. As for her being a copy of this or that, she resembles nothing on earth, under the earth, in or on the waters, under or on the earth, except herself.

Does your correspondent "Loyalty" realize the fact that the Shadow draws nearly 6ft. of water without her board, and that although she has no outside lead, she has about five tons cast to fit as low as possible inside? No one ever said that the Shadow had a "cutter model," whatever that may be, and yet she is, to all intents and purposes, as much a cutter in shape as the Puritan. If every deep, narrow vessel with long overhangs is a cutter, then every cutter is a "barrel head," as half a barrel head with lead on the bottom and rigged as a toy yacht has probably been familiar to all boys living on salt water since the year one, and I should not be surprised if it was the real, if not nominal, father of the Thames rule; in which case said rule should be called "barrel head"—as good a name as any for it, probably, except block head.

In writing of the Buccaneer, Mr. Bayly forgets to say what her rig was, so perhaps she was a sloop, although classed as a cutter, in which case she might pass as the real original sheep in the wolf-fold or wolf in the sheepfold. Is the Boston keel sloop Hera a cutter? She is deep, not very wide, and has a heavy lead keel. Was the old sloop Nautilus a cutter? She had two head sails and was very deep and not very beamy. Was the old Provincetown packet, which carried a heavy iron keel before most of your readers, including myself, were thought of, a cutter? She was schooner rig, by the way. Is the Miranda a cutter or a schooner? She is almost, if not quite, cutter model.

Can you not give your readers a definition of cutter and sloop? I mean a clear, concise, every day working definition. It would save a great deal of "wind chewing," which would be a great blessing in New York Harbor in summer, as wind seems rather scarce there usually. Do you consider a vessel which, in order to make a passage across the Western ocean, has to come down to jury rig, a nice sort of craft to go to sea in? Why so much fuss about the Genesta and not a word for the little Clara, which came over with her working spars? Why is a jib set flying any more English than French or Dutch? Pardon such a number of questions, but I am a steady reader of FOREST AND STREAM, *Spirit of the Times* and New York *Herald*, the result of the last three months' reading being to greatly unsettle my mind, or what I am pleased to call my mind, and to give me serious doubts what kind of a craft I have been on board of all summer, to which doubt you are indebted for this long letter. I am afraid that most of my questions partake of the nature of the large and unfortunately increasing class of conundrums to which the only answer is "So is a hen." In the criticisms of the treatment received by the owners of the Puritan from the New York Y. C., I do not think enough stress has been laid on the truly hospitable behavior of Mr. Busk, of the Mischief, and it seems to me that he did so much that the queer actions, or rather lack of actions on the part of the other members of the club to which he belongs, should be passed over in silence even had they been much queerer than they were.

In your issue of Oct. 8 you claim that the Genesta is the superior of all American yachts except the Puritan, and equal to her. Now I hold the belief, and I am by no means alone in that belief, that the Priscilla would make a very close race with the Genesta, much closer than the Genesta can make with Puritan, in any kind of weather. In the last race, although the Puritan only beat the Genesta a little over one minute, yet she sailed fully one mile further, and practically beat the Genesta three times in one race; in fact the boat won in spite of about as bad management as I ever saw in a race. I think there can be but few people, who know one end of a boat from another, who saw the race and the attempted races, who can have much doubt that the Puritan is able to beat Genesta from ten to fifteen minutes over a fifty-mile course, in any kind of weather that the Genesta can carry her racing spars in. By the way, were the Cup races sailed to determine who was to hold the Cup, or were they merely to find out when a sloop is a cutter or a cutter a sloop? I have owned sloops such as "Loyalty" admires so much, and think there is more cutter than sloop about them. "Loyalty" makes the mistake, when he gets so excited about representative American sloops, of forgetting that the whole seaboard of the United States is not comprised in the shores of Long Island Sound and New York harbor. The Puritan may not be a representative New York sloop—no one ever claimed she was—yet she can be truly American for all that. Skimming dishes with their masts way up in their eyes have never been in favor on this side of Cape Cod, and I doubt very much if they ever will be; at any rate I hope not. If the Puritan is derived from the English, I am very much afraid that the Shadow is also, as is easily seen by comparing her with the cutter Buccaneer. I have always thought myself a sloop man, but if "Loyalty" knows what he is talking about, I find I have been laboring under a mistake, and that I am in fact the worst kind of a rabid cutter maniac; therefore I am much distressed, as I am a strong Anglophobiast, and if it were not for the hope that some of your correspondents may yet make out that cutters were first invented in this country and copied from us by the Britishers, I am afraid that I should seek consolation in suicide or a retreat in the wilds of Long Island, if you have waded through this rambling screed of mine as far as this, I think you have waded enough, and I will give you a rest, so to speak. H. B.

COHASSET, Oct. 12.

The above letter from an Eastern yachtsman reiterates the old question that has so often been discussed in our columns that it seems an unwarranted imposition on our readers to again inflict it on them, but as we have lately received some other inquiries of the same tenor as "H. B." we will herein endeavor to answer them finally and for all time before the cutter-sloop question passes into history. At the present day the two terms have lost the distinctive meaning that they once possessed, and the sooner they disappear from the yachtsman's vocabulary, or, if retained, the sooner that their meaning is definitely limited, the better it will be for all who talk or write about yachts. What is now wanted is a term that will express concisely and exactly a yacht with one mast, rigged with a boom and gaff mainsail and triangular headsails; some less awkward equivalent of the term "singlesticker," which expresses all that is really necessary, but is too lengthy and too cumbersome. We have already the words cat-boat, yawl and schooner, each of which defines a special rig, without regard to model: now a fourth is needed that will take the place of the words sloop and cutter. Here is a first rate chance for some ambitious yachtsman to distinguish himself and confer a substantial benefit on his fellows by coining a suitable substitute and letting these two words revert to their proper meaning. They both have been greatly abused of late years, knocked about like a pair of shuttlecocks, but the great changes that have been made in our yachts within a few years have destroyed their distinctive meanings and made it almost impossible to define them now.

To do so, we must go back to the time when the English cutter, both in rig and model, was practically unknown in American waters, about six or seven years ago. At that time, the word cutter, as applied by English yachtsmen, the only ones who habitually used it, was applied to the rig only. This rig had as its prominent features, one mast stepped well aft, and four principal sails, a mainsail with long head and low hoist, a foresail, staysail or forestaysail set on a stay from the stem head, a jib set flying or on its own luff from the bowsprit end, and a topsail. A marked feature of the rig was that the three lower sails presented a rather long and low area, while the topsail was very large in proportion to them, while a second feature was the divisibility of the sails and the facilities afforded for many and easy changes. Five or six sizes of jibs were used and four sizes of topsails, while the entire spar plan made for corresponding reductions, topsails being fitted to lower and the bowsprit to reef in. There were also some minor peculiarities, the mainsail was almost always loose on the foot, and the spars were thoroughly stayed with shifting backstays, while the jib was set up with a powerful chain purchase, and at times the mainsail was stowed and a trysail set. The salient and distinguishing features of the rig may then be briefly summed up as follows: one mast, four sails, low and broad mainsail, low and extended area of lower sail, large proportionate area of topsail, several sizes of jibs and topsails, and housing spars well stayed.

Now, looking at American single stickers, dubbed sloops, there was a marked difference. In the first place there were only three sails—mainsail, jib and topsail: the mainsail was very long in the hoist, with a short, high peaked gaff. The jib was of very great size and was set on a fixed stay at bowsprit end; it was reefed or "bobbed," as occasion compelled, but could not be taken in. The area of the two sails was lofty and narrow, and the topsail was of very small size compared with lower sails; while bowsprit and topmast, the latter a short, stumpy affair, were both fixtures. The mainsail was also laced to the boom, and even some cases have been known where the jib was laced to a boom also, while excepting the extra topsails, no variation of sail area was possible except by reefing, and the mast was as far forward as possible. Briefly, then, the sloop rig had three sails—high and narrow mainsail, very small topsail, very large jib and fixed spars. These were the meanings accorded to the words when applied, as they properly were, to the rig, by those who used them. Now, looking at the hulls that carried these rigs, we find that the English yacht, whether cutter or schooner rigged, had some marked peculiarities. Her proportion of beam to length varied from 1-3 to 1-7, approaching the latter of late in the small sizes; while the draft, all the boats having keels, was as much, and in many cases more than the beam. All of these boats had flush decks, metal keels of greater or less weight, a plumb stem, a long overhang or counter, and none were centerboard boats except a few isolated instances no more numerous than the old yachts once were here; while they were boats of heavy displacement. The models were approximately the same, whether cutter, yawl or schooner rigged, and many of the boats were of moderate beam. With the awakening of an interest in these boats among American yachtsmen they naturally looked at the fastest racing craft of the day, which were all very narrow, very deep, with heavy lead keels and cutter rigged; and these are the only boats they have ever shown any special interest in. They were cutters in one sense, and the term has been applied to them and to them only in the long controversy over English and American models and rigs; but at the same time there were hosts of other yachts, cruisers and ex-racers, all keel boats of moderate beam with outside ballast, such as Buccaneer, which were just as thoroughly English cutters, and which in numbers exceeded the "lead mine" pure and simple, to which the name was misapplied.

The American boat of the same period was of an average beam of one-third or over, a draft of less than one-third of the beam, with inside ballast of scrap iron or even partly of stone; all with centerboards, trunk cabins, short overhang aft and clipper stems, and all of light displacement. Some of these were schooner-rigged, but the principal ones and the fastest were sloop-rigged and entered into the controversy under the name of sloops. As most of the type were sloop-rigged, and as the keel sloops were small and few in number, the word answered well enough for the time, and the terms sloop and cutter came into general use with the two special meanings attached to them that we have indicated above.

It is true, as "H. B." states, that there was then the Shadow, deeper and far better than her class, and some others that gave promise of something better in time; but though the whole seaboard of the United States is not comprised in the shores of Long Island and New York harbor, it is equally true that New York harbor has been the headquarters of American yacht racing from its birth and the home of those yachts, especially in the larger sizes, which by their performances have won the title of representative American yachts. We do not wish to depreciate Boston yachts and yachting; in respect to honest boats and real amateur sailorizing they have been ahead of New York for a long time, but when it comes to fast sloops or schooners of large size, especially the former, Boston is out of the count.

Not to meddle with ancient history but only going back to the middle ages that preceded the modern renaissance that has made a Puritan not only a possibility, but has made American yachtsmen receive her with open arms as what they always believed in, we find the racing fleet of "repperysentative" yachts composed of Arrow, Vision, Gracie, Addie Voorhis, Windward, Meta, Whitewing, Fanny, Coming and their tribe. These boats were modeled and built on the Sound or about New York, they belonged to the New York Y. C., they raced over its course or at Newport for its prizes, and their fame is firmly connected with New York yachting. These were the boats that were put forward prominently at the opening of the controversy and they represented in their design and construction certain ideas which were then generally accepted by the body of American yachtsmen. Before attempting to class Puritan let us see what these ideas were, and how they compared with the similar features of English boats. First, their displacement was relatively small, much less than that of the English models, their ballast was of bulky material, stowed inside the hull at a greater or less height, while the cutter, as we will continue to call her, carried her ballast in the compact shape of lead, stowed as far as possible on the keel; the sloop had a centerboard and drew 5 or 6ft. of water, the cutter had a keel and a draft of 10 to 18ft.; the former had a beam of one-third her waterline, and even more, while the average large cutter had about one-fifth of her length.

The difference in rig we have already noticed, beside which there were some secondary but marked points of difference. The sloop had a long overhanging clipper stem, a short round to the fore foot, a keal nearly straight with greatest draft aft, a vertical sternpost, a shot stubby counter, a low waist, high ends, and a high cabin house. Contrasted with these the cutter had a plumb stem, a fore foot boldly cut away, a keel well rockered with its depth abaft the midships, a great rake of sternpost, a long, light counter, high freeboard, and flush decks. Some of these features, such as the shape of the stem, are merely superficial and have little effect on the performance of the boat, but at the same time they were distinctive and marked the difference between the two classes. At all times boats have been found on each side that embody some of the principles of the other: even now, since the alteration of the rule, clipper stems have become popular on the smaller yachts in England, and in this country we have at times had narrow yachts, yachts with iron keels (as the old Provincetown packets instanced by our correspondent), deep yachts like Shadow, and yachts with double headsails; but still these features were directly contrary not only to expressed theories but to our general practice.

Besides the many points of difference mentioned above there were other details of construction, the methods of framing and ballasting, the wide keel of the English yacht blending into the hull with no break at the rabbet line, and many points in the iron work, masthead fittings, lead of lines and make of sails.

We see, then, that by general usage and consent the term cutter, strictly pertaining to rig only, had in time come to signify a yacht of certain proportions and features, all pretty clearly marked, and of a certain definite rig; while the term sloop was applied in the same way to a yacht of different proportions, details and rig. At one time the nomenclature answered very fairly, but within five years past a great change has been wrought. The cutter of to-day is practically the same as that of 1880, only a little deeper and narrower; but what about the sloop? One by one the various points of the cutter, both rig and model, have been quietly incorporated in the so-called sloop until it is no wonder that even her oldest friends fail to recognize and sometimes refuse to own her. The rig, the single-handed rig with the low rig, long gaff, long housing topmast, backstays, and many minor details are too common on our boats to excite any notice. Lead ballast, as low as possible, is preferred by all, higher freeboard, plumb stem, counters, are found everywhere, and practice has fully proved their value.

But where did all these features come from? How many of the points of the American model and rig have survived? We still adhere to the beam, but not to the extent we once did. Depth has increased greatly. The high bilge is still found as a necessary adjunct to the beam, and the centerboard is still retained. Beyond this we follow in rig and other features, the cutter, until it is no wonder that a man stops bewildered and asks, "What is a cutter and what is a sloop?" It is true that on three points, and these the most important ones, we still differ radically from the English; on beam, displacement and centerboard; but at the same time the beam is less than of old, and may still further decrease in time, the entire theories of light displacement have been thrown overboard, and though using less than the cutters it is more than the old sloops; and it now looks as though even if we retain the board it will be with a substantial keel added, as in Puritan. On all other points save two minor ones, laced mainsail and housing bowsprit, we have generally accepted the English methods in our practice.

It is still a difficult task to class Puritan, but first let us make it plain what we have thus far claimed in regard to her; not that she is neccessarily a cutter, not that she is not a sloop, but that she is in no way a representative of the class of large American single-stick boats, or of our beliefs and practice until a very recent period, and that apart from the beam, board and moderate displacement, her details are those of the cutter rather than the sloop. The beam, while much less than the old boats, is in direct opposition to English ideas, the displacement is less than Genesta's on the same length, but at the same time it is much greater than formerly; the centerboard is retained, but to it is added a substantial keel 9in. deep and 22in. wide on top. True, she has a laced mainsail and fixed bowsprit, but the other features are entirely those of the cutter as far as is compatible with the two fixed conditions of a moderately wide and shallow centerboard yacht, by which her designer was actually limited.

To enumerate some of these features, her rig is in principle the cutter, mast well aft, low hoist, long gaff, long topmast, foresail on stay, jib set flying, with various sizes of jibs, backstays, boom outhaul, masthead fittings, round bowsprit, all, both in principle and detail, are English and distinctively non-American, except in so far as they can be called so from having been naturalized since Madge came here, or, as our correspondent states, made in America by Americans. In the hull the same resemblance is found; the plumb stem, the handsome rocker to the keel, the raking sternpost and counter, and the shape of her lead keel as well as the keel itself, all proclaim at once their origin, while the sheer is no more American than English. That she would be better with a sloop rig, that the stern hinders her speed, that her lead keel makes her logy, no one would now contend; her success has been a full justification of her designer's judgment in selecting these features and his skill in combining them, but let us at least be honest and acknowledge their origin, and also that they are contrary to the beliefs once boldly expressed by American yachtsmen.

"H. B." instances Shadow as similar to Puritan, and in some respects she may be; but again in many features—rig, general outline, lead keel and others she differs materially. If we have made our views clear we have answered incidentally several of his "conundrums;" but there are still two or three left, though we share his doubt as to what kind of a craft he sails aboard and heartily sympathize with his perplexity. We consider Genesta a fit vessel to go to sea in, and it does not follow, in these days of oversparring, that a vessel can carry safely in an ocean voyage in the fall such a rig as summer racing necessitates. Were Puritan with her on her present cruise she might be glad to reef that long boom with a handsaw before she sighted the Needles. Genesta had an extra word for her passage out because she was the first of her type that had crossed the Atlantic. After her followed Stranger, and the two, with the bustle of the races, rather overshadowed the feat of little Clara, which was much more worthy of comment than either of the others, and settles pretty conclusively the question of the sea-going powers of these boats. The jib set flying is in one sense as much Dutch or French as English, as they all use it; but yachting in Holland, or even in France, amounts to very little compared with England, and is only a copy and reflex of the latter. As our correspondent knows, the only real yachting nations are America and England (and Boston?).

We have endeavored, without classing Puritan, or complying exactly with his first request, to shed such light on the subject as would make it plain to all what the difference between the types really is or was. Our yachts have been, and are still, in a transition state, in which the terms cutter and sloop have lost their meaning; what the coming American yacht will be like, or by what name she will be called, we cannot say, but it is certain she will have little claim to the title of sloop. If the two words are retained, we should in the future define a sloop as a vessel with one mast stepped forward, one jib, a fixed bowsprit and stay; and a cutter as a vessel with one mast stepped well aft, two head sails, and a long topmast, leaving minor points unnoticed, as they are now common to both, and excluding any idea of model as in the case of yawl and schooner. The leading differences in model, large or small beam, heavy or light displacement and draft, and centerboard or keel, must be denoted by some new terms.

"H. B.'s" estimate of Priscilla is simply one man's opinion and differs from that of many others, even her own friends, and she herself has done little this year to justify it. We cannot agree with his conclusions in regard to the final race and much less as to the relative speed of Puritan and Genesta, but every man is entitled to his own opinions.

If "H. B." follows out his intention of seeking a quiet retreat in which to meditate for a time, we hope to have his address, in case there should be anything further to communicate.

ANOTHER ANSWER TO THE QUESTION.

Editor Forest and Stream:

Mr. Bayly asks me through your columns what are the points which constitute the difference between cutter and sloop other than their rig, and as the gentleman knows what he is talking about, I will freely admit that strictly, or rather technically, speaking, there is none. A sloop may be wide or she may be narrow; she may or may not have a centerboard: Her draft of water can be one foot or twenty feet, and precisely the same may be said of the cutter. Even in rig the two approach so nearly that it would require a very long-headed sea lawyer to mark the dividing line. As a matter of fact, if I am not mistaken, cutters are in England sometimes called sloops.

There are two things which usually the cutter does and the sloop does not possess, namely, a loose-footed mainsail and a sliding bowsprit. This may be called the chief difference, though practically a trifling one, between the two, so far as mere technicality goes, but as Galatea is to have a laced mainsail (and a centerboard) we may expect that in the near future the two types will so closely fraternize that both will from sheer necessity sail under one name, as they now do in the New York Y. C. And, after all, why not? Our English relatives can teach us many things worth knowing. They are also willing to be taught by us.

In my previous letters on the sloop cutter question it has been my wish to emphasize more particularly the difference in shape of hull between the modern English racing cutter and the American sloop rather than to discuss the minor and more indistinctly defined matter of rig, and this distinctness as to form is fortunately very clearly dis-

played in Genesta and Puritan. The former is six times as long as she is wide, draws 15ft. of water, and would not be capable of standing erect on the water if her ballast were removed; while the latter has about four beams for length, draws 8½ft. including keel, and has sufficient initial stability to stand alone without ballast. In other words, the two are in form diametrical opposites. Both are very good in their way, but the narrow and deep boat is not suitable for our uses except as a mere racer, and even in this respect she has been recently and conclusively proven, in both light and strong breezes, to windward and free, inferior to the so-called "typical American sloop." The designer and the owner of Genesta appear to admit this as a fact. What more remains to be said on the well-worn subject? Suppose we now take a rest.

In alluding to old Buccaneer Mr. Bayly assists my argument. Her dimensions, as he gives them, approach very nearly those of our best sloops, and therefore I should call her a superior craft, both for all-round sailing and for racing, to the modern cutter.

ROSLYN, L. I., Oct. 9, 1885. THOMAS CLAPHAM.

WHOSE WATERLOO?

(Continued.)

ALTHOUGH all the daily newspapers and innumerable other publications furnished long-winded accounts of the international races, their efforts were directed more to ward the painting of dashing "pen pictures" than toward a technical comparison of the performance of the competitors. Accuracy was about the last thing upon which any stress was laid, nor was there sufficient time for the production of accurate reports upon such short notice, even had the daily papers equipped themselves with competent critics for the occasion. With the *N. Y. World* as the one exception, the comments of the other daily papers can be dismissed at once as utterly worthless and unreliable. The *World* has upon its staff an old sailor, who, if ridiculou ly at sea on all concerning the mechanics and principles of yacht construction, is at least seaman enough to note and appreciate the meaning of a shift of wind of four points. This same old sailorman has all along evinced the orthodox prejudices against cutters common among people having no experience with the British vessel. His partiality for the sloop serves to make quotations from his report all the more pointed. These I will supplement from the *Spirit of the Times*, another journal of strong prejudices and lacking totally in familiarity with the truth concerning cutters. Surely I could not handicap my task more heavily at the outset.

In the match, Sept. 14, over the N. Y. Y. C. course, my observations were as follows: Genesta made her usual wretched start, permitting Puritan to cross the line higher up and blanket the cutter under her lee, as they stood across to the Long Island shore on the first board of the race. Of course the cutter had to be kept away to get out of the scalding, and the so-called sloop appeared to the common public and newspaper men to be holding a better wind. Her apparent success was, however, a matter of skillful maneuvering at the start, and not due to the vessel herself. I quote in support from the report in the *Spirit of the Times:*

"Starting on Genesta's weather bow, the Puritan forced the British boat to keep off in the first reach across in order to get out from under the white sloop's lee, so that when both tacked again between Clifton and Stapleton landings the Puritan's increased lead was due to the British boat's enforced running off rather than to any superiority in the white boat's sailing."

My next point is this: The wind hauled to the westward, and when both yachts came up to their course Puritan benefited immensely by the shift, and her additional lead, supposed by the average spectator to be due to faster footing, was in reality due to a caprice in the weather. Again from the *Spirit of the Times:*

"When the wind hauled three points to the westward and became due west. Both yachts came up to their required courses and headed down through the Narrows, so that all the distance between them represented Puritan's lead."

Going down the Staten Island shore, Puritan got a streak of wind which suddenly lifted her clean away from the cutter. She carried a big bone in her teeth and heeled down to her bearings, while Genesta lay bolt upright almost becalmed. This gave the Puritan a lead of 5min. when abreast of Fort Wadsworth in the Narrows. That she could possibly have gained this much in two short miles stands to reason without argument. For had Puritan accomplished such a thing upon her merits as a boat, she would have shown herself capable of footing two miles to the cutter's one, and in the light of all the racing, such an assertion would not be sane. That it was luck and nothing but luck which gave Puritan her lead through the Narrows, can be settled by once more citing my witness, who writes in the same paper:

"Here is the whole thing in a nut shell. That the Yankee boat, passing Fort Wadworth on the way out and when the race had just begun, was five minutes ahead of the British boat, both having started at the same time, and that this lead was due to the accident of circumstances rather than to superior sailing * * * What then becomes of the great Yankee triumph?"

Could I ask for more positive indorsement of my own observations than the above supplies? But, as if all this were not enough, my witness, with an amount of candor and honesty greatly to his credit, continues amplifying his own statement in the following strain:

"They both reached in toward the Long Island shore on starboard tack, with wind southwest by west. The deep cutter tacked first, and thirty seconds later the Yankee sloop went about, retaining her position on the cutter's weather bow and blanketing her. This was not a pleasant position, and Capt. Carter let the cutter go off a couple of points and reach through the white sloop's lee. Of course when over on the other shore, she was much further to leeward than at the start. Had the wind remained steady on the next tack the Genesta might have had a chance to eat up across the white sloop's wake to her weather quarter, but the shift of wind put her directly astern of the Boston boat and, as stated, she passed through the Narrows five minutes astern of her."

And further, listen to this, which is very true and a reflex of my own opinion exactly:

Now, reverse their positions. Suppose that the cutter had gone over the line on the sloop's weather beam or bow; is there not a strong probability that their positions in the Narrows would also have been reversed, and that the Yankee sloop would have been five minutes behind instead of five minutes ahead?"

Here I have explained by the testimony of a third party the beginning of this race and shown that fluke had accomplished for Puritan what she could not dream of accomplishing upon her own merit. From the Narrows down to the Spit my observations would describe the whole stretch as a gigantic lot of fluking of the most outrageous sort, in which both yachts had their share and to decide which not even a Philadelphia lawyer could undertake. Hence no opportunity was afforded for passing judgment upon either yacht. They sailed different water; they had different airs from all round the compass. This is my statement. Now for disinterested corroboration. The journal already quoted has the following:

"All the way across the lower bay the wind had been fluky. * * * After a season of calm the wind came in south-southwest, putting the Puritan dead to windward for the whole distance which separated the boats. This was her luck. * * * The Genesta got a little streak of luck. * * * At No. 8½ the interval of time was but three minutes, showing a gain for the Genesta of ten seconds from buoy No. 10, both yachts being nearly close-hauled. The distance was but short, but this is important, as it will be shown later that close-hauled, or nearly so, Genesta is a trifle the best."

While the quotation bears me out in throwing out the work from the Narrows down to the Southwest Spit as too fluky to permit deductions worthy of confidence, my witness even goes further than I do and reasons that on a close-haul in light winds Genesta is actually the better boat of the two. So far then, the race has shown none of that superiority assumed by an ignorant public in behalf of the so-called sloop Puritan, and my estimate that her lead was solely a matter of fluke is set up beyond challenge. Now let us accompany the racers from the Spit to buoy No. 5, off Sandy Hook. This was a broad reach with wind abaft the beam and booms well off. Although I did not time the buoys, approximate time was taken by the judges. This gave Puritan a gain of 1min. 30sec. in two miles, quite material, did not other brushes of the same kind during the races fail to establish any such superiority on the part of the so-called sloop as this 1min. 30sec. would indicate. This is equivalent to 45sec. per mile, and would mean that in a twenty-mile reach Puritan could outrun Genesta by 15min., a proposition too nonsencical to entertain. My own observation at the time was that Puritan's gain was wholly due to striking into a freshening breeze as the Hook was opened. No special comments were made by my witness upon this reach, and as it was but two miles long we may let it go as of no importance.

"From starting line to the Narrows the position of the two boats was due to accident," so sums up my witness, "and from the Narrows to buoy No. 10 the weather was too fluky, each yacht getting her share of luck, the Genesta getting the best of it. But now outside the Hook, here was plain sailing, and a breeze that tipped the waves with ridges of white and heeled the yachts until the water foamed and hissed along their lee planksheers. * * * It was just the weather in which we have all along believed the Puritan would run away from Genesta with ease. * * * A scupper breeze and smooth water."

Such were the conditions under which the first real racing of the day took place. My observation was that on the whole run out to the lightship, the yachts being one point free or thereabouts, both yachts held their own, the difference being too small for estimate and of no consideration in its practical aspect. In other words the cutter showed herself quite as speedy as the so-called sloop in the latter's special wind, weather and water. Now what has my witness to say?

"Mile after mile of the seven to the lightship was covered, and the keenest observer could detect no change in the relative positions of the boats. * * * The figures at the lightship tell the story, and this time tell it truly, for there was no variation of wind and each had it alike, and the lightship figures are: Puritan 2:14:54, Genesta 2:19:16, difference 4.22; difference at Sandy Hook buoy No. 5, 4.35; Genesta's gain 13sec. Bear in mind that the cutter's gain, under precisely similar circumstances, from buoy No 10 to 8½ was 3sec., and it may be said with pretty certain exactness that at reaching the Genesta is the best."

Now then, how much had the Puritan, "conclusively proven," the superiority of her type in the first half of the race from start to turn? Remember I have not asked any one to accept my own observations, but have sustained them by quotations from a third party, known to be inimical, and implacably so, to the interests of the cutter. Yet the average spectator upon the steamboats at the turn was convinced in his own conceit that Puritan led round through merit of type, a conclusion utterly at variance with the truth and not tenable for a moment by persons viewing the match without the petty national prejudice to be expected from a ward politician or a blatherskite on the stump.

The run home will next receive attention. With the wind abaft the beam, both yachts practically held their own again and I could detect no difference in their sailing. The times taken at the Hook show a gain for the Puritan of 18s., or to all intents and purposes a balance against the 13s. gained by the Genesta on the run out. Total difference in favor of Puritan on the seven miles out and seven miles in just 5s. Surely no person in his senses would pretend that 5s. in fourteen miles is to be regarded as "conclusively proving" the superiority of one vessel over another, or as proving anything at all, considering the multitude of causes outside the mere fashioning of the hull which contribute to the success or failure of a racing vessel. But even this difference of 5s. in favor of Puritan I can wipe out and much more by simply referring to the quotations from the London *Field* printed in my letter last week. They will show that the wash from the steamboats was lavished upon Genesta in a reckless way and that several minutes loss are to be attributed to their shameful behavior. But for their interference, the gain at the Hook upon the return would unquestionably have been heavily in favor of Genesta. As it was it requires no further attention. Even my witness is moved to remark that "we fail to find much encouragement in this."

From the Hook in to the Spit the wind began to flatten as the ebb tide increased in strength. The advantage was all with the leading boat in consequence. Puritan got round the Spit at 3:33, after standacross shoal ground where Genesta could not follow, and the cutter got round at 3:42, nine minutes later. This represents a loss of five minutes from Hook to Spit, a distance of two miles, and, of course, no one pretends Puritan outsailed the cutter to that extent, or to any extent in view of what had already been seen during the day. Booms were then way off for the finish, the leading boat just fetching across the line as the wind fell to almost a dead calm. The cutter got nipped by the ebb and barely drifted up to the end of the business, outlucked by some sixteen minutes but not by any means beaten on her merits. Says my witness: "The leading yacht, by taking up a piece of her centerboard, was able to hold her port reach well on, with the strong ebb on her lee bow horsing her to windward, * * The cutter could not hold her port reach so long, and when she went in toward the Hook she had the ebb out of the Shrewsbury River on her weather bow.* * The wind, paltry for the whole run up, almost entirely petered out at the close, and therefore the figures at the finish are illusory. By them the victory of Puritan is 16m. 19s., but it must be remembered that with a strong ebb tide and scarce a breath of wind, she was all this time in running an extremely short distance. We should say, from observation, that when the Puritan crossed the line the Genesta was 'not over a mile astern of her.'"

I may also add that the steamers interfered to such an extent that Genesta gave up all attempts at racing long before the finish was made. The imperative necessity for an outside course, free from shoals and irregular tides for a fair trial is plain, and I hope Galatea will resist an effort to handicap her as Genesta was in these respects.

This winds up the first match. I have shown that wherever a true wind was found, Genesta got the better of Puritan much oftener than the latter outtopped the cutter. I have shown that Puritan's victory was the result of very common vulgar fluking. I have shown that the bowl about the "superiority of the Puritan type" is absolute bosh, which even a simpleton should hesitate to advance and, which from a sane person is downright disreputable. I have shown this by the testimony of a third party. I claim no superiority for the cutter, nor have I ever done so in all my writings, so far as competition under "normal conditions" is concerned. But I have claimed that the cutter, so far from being a tub in comparison with our sloops, was entitled to equal rank as a fast sailer. The first race sustains me in my position.

In mild weather, smooth water and winds from a calm up to working topsail breeze, Genesta was found a full match for the Puritan.

The second race was set for Sept. 16, over a course twenty miles eastward from the Scotland lightship and return. A run down wind and a beat back—at least, so it was intended; but a shift in the wind shortly after turning made it a long and short leg work home instead. As there was a nice topsail breeze blowing, freshening into lower sail strength for a short while with a slight sea running in obedience to a wind blowing off a shore close aboard, the verdant public has been led to believe by equally verdant newspaper reporters that the match was sailed in a "howling gale," in "Genesta weather," in a "hurricane and Channel sea." I confess nothing caused me so much amusement as this exhibition of a landsman's fright the first time he looks upon the sea stirred up by a moderate summer's breeze from its usual lethargy. And the same feeling of hilarity seems to have seized our cousins abroad who have had a great deal of sport out of the lubberly versions of the seasick haymakers representing the press for the occasion. The London *Field* cracks its little joke over the "O pilot, 'tis a fearful night" kind of individual who manipulated the ocean cables and sent a thrill of horror through the tight little island with the dreadful news that the race had come off in "a howling gale." Visions of housed topmasts, close-reefed bowsprits, trysails and spitfires rose before the public and anxiously they scanned the bulletins for additional particulars, only to break out in loud guffaws at the announcement that through this howling gale, this terrible ordeal which was supposed to have brought out the hard-weather qualities of Genesta for all they were worth, the cutter sported sticks up and topsail all through! And even the Puritan found no need of a reef in her mainsail. The wind blew scarce 20 miles an hour average and during a light squall of ten minutes duration, the velocity increased to about 30. At no time was the sea high or troublesome and at worst it could be characterized as a short jump of which an "eighty" in a race would scarce take notice. The run out was sailed in practically smooth water, and two-thirds of the beat home was also in water so smooth that the yachts hardly lifted or felt to its influence. For less than one-sixth of the course they experienced a slight jump. But the press tug, a wretched sea boat at all times, being driven at 10-knot speed head on to the sea, dove like a porpoise as a matter of course, and occasionally sent the drift over her pilot house, giving the lanky spindleshanks in store clothes representing the press their first taste of salt water. Now beer and salt water don't mix. With heads more or less befuddled, and insides promptly emptied in deference to Old Nep., it was perhaps natural that to the average reportorial mind the sea assumed portentous dimensions and to that effect they accordingly delivered themselves to the great amusement of nautical men and yachting experts in general. Neither sea nor wind were really worth mentioning. My wonder is what the public and the newspapers would have to say could they witness a Channel match in really coarse weather which would bring Genesta two ensigns down and No. 4 jib half way out on a reefed bowsprit. It would be a sight and an experience, the existence of which they not even dream of now.

The New York *World* hits it about right in the following: "There was a fair sailing breeze for the run out, and a lower sail breeze for the beat back." Surely this is no "Genesta weather," and far less is it a regular "Channel gale and steep sea." The London *Field*, Oct. 3, says: "There was a nice big topsail breeze blowing, which strengthened as the day drew on, so much so that upon turning the stakeboat for the beat home Genesta had enough wind for her jibheader." The *Spirit of the Times* says: "The weather was gloriously fine and the sea smooth." And yet there are patriots by the thousand firmly convinced that our so-called sloop has actually met the cutter in the "howling gale" for which it is supposed the cutter men had all along been praying. Such bosh as has been written anent this race and the fierce weather the landsmen believe they have seen is enough to make a stoic split his sides with laughter. If the day is to be characterized at all, it came much nearer being "our weather and our smooth water" than it did to a Channel blow and sea. It was more favorable to the sloop, and never once put Genesta to her hardweather metal. Says the *Field*: "After rounding the cutter was going along dry and comfortable while the sloop was throwing clouds of spray over her."

A foolish and disingenuous attempt has been made in the *Herald* to decry the cutter as a good sea boat. My observations were quite to the contrary. At all times the Genesta was a drier and more comfortable vessel than the Puritan, who made the water fly across her decks at a frightful rate, soaking everything fore and aft. The report in the *Field* confirms what I have said on this head and what is well enough known to all who have sailed in cutters that such boats are infinitely drier and better behaved in a sea than a sloop of any type can ever be. It has been stated in the prints that Genesta carried the water up to her hatches. How this is to be reconciled with my own observation to the contrary, with the report in the *Field* and with the evident impossibility of the feat, especially as the cutter's angle of heel was estimated by the *World* at only thirty degrees, the patriot may attempt to solve at his own sweet will. To me a statement which carries absurdity on its face calls for no further refutation. As for the Puritan, she made a wretched display and could not compare with the cutter. The London *Field* says:

"Puritan, literally buried in spray, showed a good piece of her bottom to windward—so much so that it appeared as though a little more and she would reach the vanishing point of her own stability."

Yet this was in nothing more than a topsail breeze for the Genesta!

And again: "The Puritan drove the spray in showers from her lee bow and smothered her deck fore and aft with weather drift."

A nice kind of vessel to prefer for cruising "in comfort" to the easy-going Genesta, with her dry decks! And a pretty mess the so-called sloop would have made of it had she dared face Genesta again in the Brenton's Reef match.

Of the race itself, little need be said. Down wind I saw nothing to choose between the two. Cavillers pretend Puritan's canvas was not handled to advantage, because she did not shift over spinnaker with Genesta. My view of it was this. The cutter having run away to the southward, had to haul up a bit for the outer mark and jibed in consequence. Puritan having steered a straighter course had no need to jibe. At all events it is a question whether the delay incident to the operation would not have been an offset to the gain from shifting, and on this I am content to believe that between Capt. Joe Ellsworth, Skipper Crocker and the gentlemen aboard the Puritan, there was better seamanship on tap than all the landsmen scribblers for the press combined could muster in a life time. It is enough that knowing heads aboard Puritan saw no sufficient cause to jibe over. On the run out Genesta had the best of it by about 2min. But in deference to the opposition I will concede the 2min. to superior seamanship aboard the cutter. The fact then remains that both were alike for 20 miles square down wind, and all I have ever claimed for the cutter was that she could be made to equal the sloop in speed. This part of the race demonstrated the correctness of my position. Had there been a sea on, the cutter would have had much the best of it, for the sloop could not have held as steady a course. After the round both settled down to the windward work, Puritan smothered to such a degree that topmast was housed, while Genesta readily carried small topsail, though the sail did not sit well enough to do her any good. It was a drag instead of a benefit. How did the two compare now at the new work? My own observation was that Genesta was fast eating out to windward and making far better weather of it than the sloop. The cutter had the race in hand according to my judgment, that is bar accident and fluke. She pointed and fetched higher than the sloop which was sagging away under the lee bow of the Genesta. Here is what my witnesses have to say:

The *Spirit of the Times:* "They headed in about north-northwest, the Genesta a couple of points abaft the sloop's weather beam * * The Puritan had taken position under the cutter's lee bow. * * * The Yankee sloop went off further and further on the cutter's lee bow."

Certainly that shows well for the Genesta's high pointing.

The *Field* says: "With sheets aboard, Genesta held her starboard tack; Puritan following in her wake, was first luffed out on her weather quarter, but finding that the pinching game did not do in the little lop there was on, she tried the ramping game, but all to no purpose, as she certainly fell both astern and to leeward of the cutter. * * * Puritan was sagging to leeward a good deal."

Is there much comfort in this quotation for those who thought they detected "vast superiority" in the type of the Puritan, and how much "superior" to the keel did the centerboard show itself in the game of hanging on?

The *World*, Sept. 17, says: "The cutter evidently was holding to windward better."

Wherein then did the centerboard show any superiority, when all reports agree with my personal observation that the cutter was much the better of the pair?

Things went along in this style until a short squall overtook the racers and the wind veered from W.N.W. to N.N.W. and plumped the so-called sloop high out to windward at a bound, wiping out all the water Genesta had gained by her high pointing and permitting the Puritan to come down for the finish on a long leg with sheets lifted, while poor Genesta had to pinch to achieve the same end! Here was luck, wholesale luck, Puritan luck, the luck which turned inevitable defeat into an accidental victory. This luck robbed the Genesta of the second race and turned the giddy heads of the patriots to whom a big shift of four points was a trifle not worth wasting time over, and the mere official record at the finish everything that was needed to "prove conclusively" the "vast superiority" of the "typical sloop" over such an incontinental piece of humbug as the British cutter, which of course, in the light of the official result must be "all wrong" and totally unable to cope with the great genius which in six short months produced such a wonderful marvel as the hybrid Puritan! and so forth, *ad nauseam.*

And yet to think, that overlooking the four points shift, there was but a slight margin of 1m. 38s. in favor of the so-called sloop, a difference that can be accounted for through a hundred minor reasons apart altogether from differences in type. I saw nothing in this race which could, on a pinch, be received as "evident superiority" on the part of the sloop. On the contrary, all I saw in regard to speed and behavior was in favor of the Genesta. In speed and closewindedness the difference was but trifling, but in behavior and dryness the cutter was decidedly the more preferable of the two. Let me again call upon my witnesses in regard to the shift which transferred the victory to the wrong boat.

The *World* says: "The sloop, however, was favored on the return by a shift of some three or four points in the wind, and probably had the breeze remained steady and the return course been a beat to windward, the result might have been different. When they first tacked to the northward the Puritan was down on the cutter's lee bow. In the squall which came on soon after the wind hauled from northwest by west to north-northwest, and as the yachts broke off the Puritan was placed more and more ahead, and, of course, when they tacked for the final reach she was all her distance ahead to windward. This enabled her to come for the mark with sheets a trifle eased, while the cutter was obliged to pinch all the way in. It is certain that had the shift of three or four points in the wind favored the cutter instead of the sloop it would have been much more than an equivalent for the 1m. and 38s. by which the sloop won the race."

This is an honest and fair way of acknowledging the truth, plain to all who cared to see it, that Genesta had the race in hand and would have won but for a ground fluke in Puritan's favor.

The *World* repeats its evidence in behalf of my view, winding up as follows: "The shift of wind during the first stretch to the northward had been in the Puritan's favor. Had the return been dead to windward the result might have been different."

The *Spirit of the Times* says: "The cutter is really a very remarkable boat. * * * There was a shift of wind during the second reach, when the sloop was down on the cutter's lee beam, and both were headed off. This, of course, brought the sloop some ahead, and when they tacked for the final reach to the finish line she was all the distance separating her from the cutter to windward of her. It is safe, therefore, to say, in view of the very narrow margin of time between them at the finish, that had the shift of wind been in favor of the cutter instead of the sloop, the cutter would have won. That the cup, therefore, is retained is by luck rather than by superiority of sailing is evident so far as the work in from the outer mark is concerned. * * * The net result, therefore, is that, so far as can be judged by this race, these two boats are very nearly equal in speed."

All of which coincides to a dot with my observations and fully establishes what I set out to prove by evidence from a source hitherto strongly inimical to cutters and all covering them. Both races were won by Puritan on fluke and not upon merit. In neither race did either boat demonstrate the slightest advantage in regard to their type. Both performed exactly alike to all intents and purposes.

The claim that the so-called "American model" possesses any innate advantage over the so called "cutter model" turns out to be mythical, without a shadow of a basis upon which the claim can rest.

On the other hand, the stand I have taken ever since I touched pen to paper on this subject, that the cutter was not one whit inferior in her type to the type of the sloop, has received through these races the fullest and most unequivocal answer in the affirmative.

C. P. KUNHARDT.

[TO BE CONTINUED.]

Editor Forest and Stream:

Would you allow an interested reader of Mr. Kunhardt's discussion of the Puritan-Genesta race, begun in your issue of to-day, to point out a slight mistake which Mr. Kunhardt seems to have made?

Commenting on the race around the triangle in which the Genesta sailed against the Gracie and other American sloops and schooners, he says: "The Genesta wiped out the sloop Gracie far more effectively than ever Puritan accomplished."

Supposing this to mean that the Genesta beat the Gracie by more time than the Puritan had ever done, or at least by more over this course, and feeling surprised at the statement, I consulted the record, which is as follows:

Over the triangular course, trial race of Aug. 22, entries Priscilla, Puritan, Bedouin and Gracie:

	H.	M.	S.
Puritan's time, corrected	6	37	25
Gracie's time, corrected	7	02	59
Puritan wins by		25	34
Over triangular course, Sept. 18, entries Genesta, Gracie and others:			
Genesta's time, corrected	4	29	40
Gracie's time, corrected	4	51	32
Genesta wins by		21	52

So that over triangular course the Puritan beats the Gracie 4min. and 42sec. more than Genesta does, although the weather when the Genesta sailed was decidedly better for fast sailing than in the other race, as time of Gracie in both races shows. The triangle over which the Genesta sailed was a few miles—I believe five—shorter than that over which the Puritan and Gracie sailed in the first race.

But the Puritan beat the Gracie worse even than this. Over the forty-mile outside course, trial race of Aug. 20, with fair sailing breeze of 12 miles an hour—

Puritan's corrected time was	4	57	05
Gracie's corrected time was	5	32	58
Puritan won by		35	53

Or, Puritan has beaten Gracie 15 min. 1 sec. more than the Genesta beat her in the race Mr. Kunhardt is discussing, but this was over a different course and with different conditions of wind. Still it deserves to be reckoned against Mr. Kunhardt's broad statement. It may be mentioned here that in this race the Puritan beat the cutter Bedouin in absolute time over this course 27min. 10sec., and in corrected time 17min. 32sec.

In the Goelet Cup race of Aug. 3, brisk wind, course about 45 miles, Gracie was so badly beaten she withdrew.

In one of the highest scientific authorities of America, the weekly journal *Science*, of Boston, Mr. Kunhardt can find it stated that "Puritan never put her bowsprit under and beat the cutter (Bedouin) *one* hour in the twenty-mile thrash to windward." The italics are *Science's;* the race the Goelet Cup race.

It seems to me these facts have a large bearing on the relative ability of the Puritan and the Genesta. READER.

NEW YORK, Oct. 15.

FAST RUNS UNDER SAIL.—The Queen Mab, 10 tons, made a run on Sept. 19, from Dover to Brightlingsea, the distance sailed being nearly 70 miles, in 8½ hours, or at a rate of 8¼ miles per hour. According to the *Field* Genesta made a run of 20 miles last year in 1h. 44min. 36sec., at the rate of 11.46 knots per hour, while Miranda once made the same run in 2sec. less. The latter schooner is also credited with an average of 11.9 knots on a run to Boulogne and back with wind a little forward going out, and aft coming home, the latter half of the trip being made at the rate of 12.3 knots. Livonia once made the trip home from Boulogne to Dover at a speed of 13.8 knots, and this summer Irex is credited with a rate of 12.1 knots over a 50 mile course.

THE AMERICAN STEAM YACHT CLUB RACE.—Mr. Herreshoff has sent the following letter to Commodore De Cordova in regard to the disputed Cup: Bristol, R. I., Oct. 14, 1885. Alfred De Cordova, Esq., Commodore of the American Y. C. Dear Sir: In accordance with our conversation at your office, I hereby protest against the decision of the illegally constituted Regatta Committee, who met Sept. 17. I claim the Commodore's and Isherwood Cups, which were fairly won by the Stiletto on July 16. I hereby request that you call a special meeting of the club at an early date to investigate and decide the just awarding of the cups mentioned. Respectfully, J. B. HERRESHOFF. A meeting will be held on Oct. 27 to consider the matter and in the meantime the cups will not be presented.

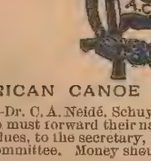
THE VOYAGE OF THE CARMELITA.—The schooner Carmelita is now laid up in the Seawanhaka Basin waiting the return of Mr. Coleman from Europe, when she will probably start again for San Francisco. Capt. Snow was taken sick in Rio Janeiro and a new captain was shipped, who took her as far as Cape Horn, and then returned to Montevideo. She laid there some time until ordered to New York. On the trip up she put into a number of ports, arriving here on Oct. 6. She is reported to be a very fine sea boat, and made the entire voyage without damage to spars or gear.

A GOOD RECORD.—The open sloop Atalanta has made an excellent record this season, winning 11 first prizes and one second prize out of 13 starts. She has also won the Beverly Y. C. first class championship pennant, the Buzzard's Bay pennant and the Hull Y. C. championship pennant in her class. Her dimensions are, length, 30ft., on waterline 26ft. 6½in., beam 11ft. 11in., Draft 3ft. 6in. boom 36ft. 6in., gaff 21ft., hoist 21ft., bowsprit to end of mainboom, 57ft. 6in. Area of mainsail 795ft., area of jib, 250ft.

THE LAUNCH OF THE WHIM.—The schooner yacht Whim, designed by Mr. A. Cary Smith, was launched from Poillon's yard on Wednesday last, and is now fitting out for a trip to Florida. She is a curious craft, built with the idea of obtaining good accommodations with very little draft. Her length is 55ft., beam 10ft., depth of hold 5ft. and draft 2ft. 8in. She has over 6ft. of headroom with a high cabin house, and is fitted up very comfortably inside. As soon as she is completed she will start for Florida.

YACHTING NOTES.—Genesta's sails and stores were shipped on the Ludgate Hill last week ... Maggie is laid up at Piepgrass' Yard. Æolus, sloop, laid up this week in the Seawanhaka Basin ... Muriel and Mona are still in commission off the Basin ... Wanda has laid up at Sixth street, Brooklyn.

GENESTA.—The City of Rome reports that on the night of Oct. 13 a small vessel with one mast was passed, which it is supposed was Genesta. The City of Rome was then about 1,100 miles east of Sandy Hook.



"GENESTA" is pronounced with a soft G.

Canoeing.

Address all communications to the Forest and Stream Publishing Co.

CANOEISTS *are invited to send us notes and full reports of cruises, club meets, information about canoeable waters, and other communications of interest.*

Secretaries of canoe clubs are requested to send to FOREST AND STREAM their addresses, with name, membership, signals, etc, of their clubs, and also notices in advance of meetings and races, and reports of the same. Canoeists and all interested in canoeing are requested to forward to FOREST AND STREAM their addresses, with logs of cruises, maps, and information concerning their local waters, drawings or descriptions of boats and fittings, and all items relating to the sport.

AMERICAN CANOE ASSOCIATION.

SECRETARY—Dr. C. A. Neidé, Schuylerville, N. Y. Candidates for membership must forward their names, with $3 for initiation fee and first year's dues, to the secretary, who will present names to the the executive committee. Money should be sent by *registered letter* or money order.

A RACE BETWEEN A CANOE AND A SHARPIE.

AS "Guenn" agreed to Mr. Clapham's acceptance of his challenge the race was sailed last week, starting from the Seawanhaka C. Y. C. Basin. The course laid out was from the basin out around buoy 18, and back, twice around, making 10 miles, the time limit being 4 hours. Mr. Clapham sailed down in the sharpie Plover, having his small sharpie in tow. The latter is a new model, a cross between a sharpie and skipjack, with a bottom a little like a sneakbox. She was 15ft. long and 6ft. beam, drawing nearly 8in., thus being wider than the ordinary sharpie. Her floor was convex, like a sneakbox, but to a less degree, and her sides were each of one board, flaring outward. She carried a catrig of over 200 sq. ft. She was in every way a larger and more powerful boat than the Guenn, and the latter was also fitted with only a cruising sail in place of her racing rig. Both started well, Guenn going over first and holding a lead for a short time, but the S. W. wind, dead aft, was very light, and the high sail of the sharpie soon took her ahead. She rounded the buoy nearly a minute ahead and started on the wind for home, both going down on starboard tack to midchannel, with the last of the ebb, and then going inshore on port tack in the flood. The wind had freshened at the buoy and sent them along, Guenn doing very well, but she had not breeze enough for her reduced rig. At the end of the first round she was so far astern that she gave up, and the race was called. It was no test, as a canoe has no business with a large sail boat; and all that it proves is the fallacy of a length rule, under which they would be rated alike.

MOHICAN C. C. RACES.

THREE races were set for Oc. 15 as follows: 1, Championship, twice over a course of 1½ miles. 2, 75ft. limited sail. 3, Oliver cup race, 60ft. limit of sail; 2 and 3 once over the course. Thetis, P. M. Wackerhagen; Annie O., H. L. Thomas; Snake, R. W. Gibson, and Marion B., R. S. Oliver, presented themselves as competitors and it was decided to sail No. 3 first, a fresh N.W. blowing. Messrs. Palmer, just returned from Europe, and Fernow acted as starters and timekeepers. The Annie O. crossed the line at 2:43½, closely followed by the Snake, 2:44, Marion B. 2:44¼, and Thetis 2:44½. The Annie O. kept the lead throughout, also once or twice she came near sailing with keel to the wind, and recrossed the line as winner of the cup at 3:02, the Snake following at 3:02¼, Thetis at 3:03, and Marion B. at 3:04. The Snake broke her tiller at the start, and after this race decided not to compete, and as the air was rather too chilly, the others were induced to postpone the races to some more favorable afternoon. FERNOW.

SHATTEMUC C. C. FALL REGATTA.

THE fall regatta of the Shattemuc C. C., of Sing Sing, N. Y., was held on Saturday afternoon, Oct 10, and was witnessed by a large number of ladies and gentlemen friends of the members. The races were called at 3:45 P. M. The following was the programme with the results:

First event, Class 2, Paddling, with the following entries: Dawn, W. M. Carpenter; Cricket, J. K. Hand; Regina, G. F. Secor. Cricket won, with Regina second.

Second event, Class 4, Paddling: Entries were: Gypsie, H. M. Carpenter; Katydid, T. J. Hand, Jr.; Dingbat, W. S. Phraner; Winnakee, G. O. Totten. Won by Gypsie, Winnakee second. This was a very closely contested race.

Third event, Tandem Race. This race brought out the following crews: W. S. Phraner and G. O. Totten in the Dingbat, Messrs. Hand in the Katydid, J. H. Carpenter and G. F. Secor in the Winnakee, and Messrs. Carpenter in the Gypsie. The Winnakee won, with Katydid second. Gypsie fouled Dingbat as they approached the finishing line.

Fourth event, Class A, Sailing, over a triangular course; the entries were: Regina, G. F. Secor; Midget, J. K. Hand; Dawn, W. M. Carpenter. Won by Midget, Regina came in second, Dawn did not finish.

Fifth event, class B, Sailing, over same course as Class A. The following were the entries: Dingbat, W. S. Phraner; Gypsie, H. M. Carpenter; Katydid, T. J. Hand, Jr.; Winnakee, G. O. Totten and Tuneta, J. H. Carpenter. The wind was very light; the first side of the course was close-hauled. Gypsie led from the start to first turn, with Katydid, Tuneta, Winnakee and Dinghat following in order named. Tuneta was doing the best windward work, and was thus gaining on the leaders. Katydid worked to windward of Gypsie and took the lead, and turned the mark first. Tuneta was very close behind, and being nearest to buoy tried to get around first, but there not being enough room between her and Katydid, fouled the buoy and gave up and returned home. Gypsie, after making two furtile attempts to get around the buoy, at last succeeded, and on the second side of the course gained some of the distance she had lost, and turned the second mark only a short distance behind Katydid and gained still more on the run home, coming in about a length behind Katydid, the winner. Winnakee came in third. She was unable to beat to windward on account of her rig, which was improvised on the moment.

The concluding event was an upset race between the Cricket, T. J. Hand, Jr., and the Midget. Cricket did not finish, the crew being unable to regain his boat for some time. After the races the prizes were awarded to the winners by the commodore. GYPSIE.

HARTFORD C. C. REGATTA.

ONE of the most prosperous of the Eastern clubs is the Hartford C. C., whose new quarters were illustrated in the FOREST AND STREAM last spring. Located on the Connecticut River at Hartford, with a handsome and convenient house, the club offers specially good facilities to canoeists, and its growth of late has been very encouraging, the active members now numbering fourteen and the associate twenty, or a total or thirty-four, most of them enthusiastic canoeists. This year the club has cruised extensively on the Connecticut River, and a number of its members have also made long cruises on Long Island Sound. The annual fall regatta, held on Oct. 10, brought out good entries in almost all of the ten events on the excellently arranged programme, and was an entire success. The first event, a boys' sailing race, the first prize being a fishing rod, second prize "Canoe Handling." The distance was half a mile, sailed in a light N. W. wind. The entries were:

A. W. Gilbert	Oahu	13min.
H. L. Williams	Phyllis	15½min.
C. H. Saunders	Petrel	—
George Forest	Quonehticut	—
E. Talcott	Hartford	Upset.

Oahu won, with Phyllis second.

The second event was an open paddling race half-mile; prizes double paddle and toolholder. Won by Venture:

L. O. Jones	Venture	L. Ingraham	Joker
W. F. Girard, Jr.	Phyllis	E. B. Gaylord	Kismet

The Petrel won the third race, a boy's paddling race, 220 yards, the prizes being a flag and camp knife.

C. H. Saunders	Petrel	A. W. Gilbert	Joker
H. L. Williams	Phyllis	E. Talcott	Hartford

No. 4 was a novice's sailing race for members only, distance 1 mile. The prizes were a flag and a Chester anchor. Only two canoes entered, the Leilah leading over most of the course, but being beaten at the last by the Quonehticut.

C. R. Forest	Quonehticut	19 min.
W. G. Abbott	Leilah	not taken

The standidg paddling race, 100 yards, was open to single and tandem canoes, the prize being a single blade paddle.

W. F. Girard, Jr.	Kismet	L. Ingraham	Joker
A. W. Dodd	Vision	John Bowles	Gluck
W. B. Davidson		L. O. Jones	Venture

Eight canoes entered for the sailing race, 1 mile, with no limits, the prizes being a flag and a copy of "Practical Boat Sailing."

John Bowles	Gluck	21m. 46s.
L. O. Jones	Venture	22m. 26s.
A. W. Dodd	Vision	28m. 48s.
A. W. Gilbert	Oahu	34m. 19s.
W. F. Girard, Jr.	Phyllis	35m. 26s.
E. Hart Fenn	Rambler	38m. 50s.
L. R. Ingraham	Rambler 2	47m.
C. R. Forest	Quonehticut	did not finish

Mr. Bowles is a member of the Springfield C. C. The hand paddling race, 100yds., prize a camp axe, was quite exciting and was a new feature in the programme. Venture won with Gluck second;

L. O. Jones	Venture	1m. 20s.
John Bowles	Gluck	
G. H. Saunders	Petrel	
E. B. Gaylord	Kismet	Did not finish.
L. R. Ingraham	Joker	Did not finish.
A. W. Gilbert	Oahu	Did not finish.
W. F. Girard, Jr.	Phyllis	Did not finish.

The tandem paddling race for one-half mile was well paddled, the Vision finally winning. Phyllis, Messrs. W. F. Girard, Jr., and H. T. Stancliffe, Jr., did not finish. The prize was a pair of Poncho blankets.

W. B. Davidson and A. W. Dodd	Vision
John Bowles and Emil Knappe	Gluck
C. H. Saunders and A. W. Gilbert	Petrel
E. Talcott and Geo. Forest	Hartford

The paddling race for all canoes, prizes double paddle and hunting knife, came next, with three entries:

W. F. Girard	Quonehticut	S. W. Burchmore — Kismet
L. O. Jones	Venture	

The wind was so light that the final race for the Commodore's Cup was postponed until Wednesday. The races were managed by Messrs. L. O. Jones, E. Hart Fenn and C. R. Forest, Regatta Committee; Dr. C. B. Parmele, starter; Mr. C. H. Lawrence, judge, and Rev. Francis Goodwin time keeper.

At half-past 4, Oct. 14, the race for the Commodore's cup was called, when four contestants appeared ready to cross the line: The Vision, sailed by W. B. Davidson; Phyllis, by W. F. Girard, Jr.; Rambler, by E. Hart Fenn; Quonehticut, by Geo. Forest, a lad of sixteen years, son of her owner. The wind now dropped to a gentle breeze, until were entertained of being able to finish. The Phyllis was given a time allowance of 20sec. and the Quonehticut 43sec. The Phyllis led strongly on the beat to windward, and it was supposed by all that she had the cup, as she was the first to round the buoy, a mile from the club float, but the Vision gradually crawled up on her on the run home and she crossed the line after a close and exciting contest, and the Phyllis lost the cup (deducting her time allowance) by just 20½ sec. The wind continued to decrease, so the remaining boats made very poor time:

	Start.	Finish.	Elapsed.	Corrected.
Vision	4 37 00½	5 00 12	0 23 11½	0 23 11½
Phyllis	4 36 31½	5 00 23½	0 23 52	0 23 32
Rambler	4 37 00	5 23 08¾	0 46 08¾	0 46 08¾
Quonehticut	4 37 17	5 42 07	1 04 50	1 04 07

CRUISE IN A CANVAS TANDEM.

BEING a constant reader of the canoe columns in the FOREST AND STREAM I could not fail to notice a short account of the cruise made by my friend and myself during the month of August, and I thought perhaps the log of the cruise would be interesting to some readers of the FOREST AND STREAM.

We started from Washington, N. J. on the morning of Aug. 4 in our tandem canoe Mischief, with a shelter tent, cots, provisions, and all other articles needed by a camping party that we could stow away under the deck and along the gunwales, leaving just enough room to sit in comfortably. After bidding good-by to the numerous friends who had assembled to see us off, we made the first mile in good style until we came to plane No. 7 West, where we had to make a portage, as there was nobody at the plane who could take us over in the car, but we had no more trouble of that kind until we came to plane No. 10 and had to hunt up the plane tender, who at first said he had orders not to let any more boats over on account of a bad break in the canal near Hackettstown, but after we had stated the circumstances to him and showed our permit, he carried us over all right, and everything went smoothly until we arrived at Phillipsburg, where we gave up our permit and were carried down to the Delaware River on the plane car at the terminus of the Morris Canal.

The river was very high, on account of the heavy rains the day before so that we had no difficulty in running the rift just below Easton, soon after which we went into camp on the Pennsylvania shore in a very pleasant spot near a good spring of fresh water, which is something not always to be found, at least we have had that experience heretofore. After putting up our tent and getting everything ready for the night, we cooked a good hot supper of ham and coffee which soon disappeared under the influence of a good healthy appetite. We turned in about 9 P. M. and slept the sleep of the weary until 5 A. M. the next morning.

Aug. 5.—After eating a good hearty breakfast and packing our dunnage in the canoe we started on down stream stopping now and then to visit some small town or to take a look at some rift before we ventured to run it, as the river is very much broken by rapids or rifts, as the old raftsmen call them. The worst one passed was called Old Sow, near Riegelsville, N. J., where the river makes a very sharp turn. After taking the proper course for our propeller the most of the time we arrived at Frenchtown about 4 P. M., where we soon attracted quite a crowd who did not make any odds of asking pointed questions, but we answered them all to the best of our ability.

After leaving Frenchtown we soon found a good camping spot on an island where we soon had our tent up and were preparing our supper when we happened to notice some young ladies on the other side of the river, watching us very curiously, and when they saw that we observed them they commenced waving their handkerchiefs at us and we returned the salute by waving our tablecloth and giving them a very cordial invitation to come over and eat supper with us, but they declined with thanks, much to our sorrow.

Aug. 6.—This morning dawned bright and warm, and as the sun got higher in the heaven it commenced to tell on our arms and faces, making them quite sore before night. About 10 o'clock we arrived at Point Pleasant, Pa., opposite Bull's Island, N. J., where the Trenton Feeder has its head, and between there and Lambertville, N. J., we passed several small rifts, but none so bad as the Well's Falls or New Hope Falls, as they are called sometimes, these are considered to be the worst rifts on the river by old raftsmen, and we were advised to carry around them, but we found out the channel and ran them with no more inconvenience than a slight wetting, which did not bother us a great deal. About 4 o'clock P. M. we ran another bad rift called Dunkerman's Falls, about six miles above Trenton, and in another hour's time we had arrived in sight of the State buildings, and went into camp quite near the road.

Aug. 7.—We were awakened this morning by the produce wagons going to Trenton, and after eating a camper's breakfast we started for the city also, where we soon arrived after running Trenton Falls, left our boat in the care of a boatman and made the tour of the capital of our little State; then called upon some friends and passed a very pleasant day, starting down the river again about 5 o'clock and going into camp at Morris Island, about two miles from Trenton, which is a very pretty spot.

Aug. 8.—We started this morning on the slack of ebb tide, and when we got to Bordentown the wind came up from the east, so we got out our sprit sail and made first-rate time till we got as far as Bristol, Pa., when the tide commenced to run in so strong against us that we stopped and got our dinners and took a good rest before we put off again, which we did about 2 o'clock. As the wind was stronger than ever, it did not take long to leave Bristol in the distance, and after passing some very fine residences on the banks of the river we arrived at Philadelphia and put up near the Chestnut street wharf, then proceeded to find a hotel.

Aug. 9.—After spending the first part of the day looking around the city and taking in the sights, we again took to the canoe and put her bow up the river. With a good sailing breeze we arrived opposite Florence Heights and began to look for a camping spot, but could not find any to suit us, until it began to threaten rain; then we soon found a place near the Penn House, where we procured some very good milk.

Aug. 10.—On getting out of bed this morning we stepped ankle-deep in water, for when we had landed the night before it was low tide, and we did not get far enough from the water's edge. Some of our stuff got wet, so we laid over until 10 o'clock to get dried out. Made Bordentown at noon, and after stopping at the collector's office of the Delaware and Raritan Canal to procure our permit, we paddled on through the canal to Trenton, but did not stop until we found a bridge tender who would take care of our canoe while we went back to the city.

Aug. 11.—Last night we spent at a hotel on Broad street, Trenton, and this morning we met a young man at the table who offered to show us through the State House, and we were not slow in accepting the invitation. Started in our canoe again this afternoon on the canal, where we passed numbers of steam barges, sloops and schooners, besides many canal boats, all going either to or from New York. We came across one bridge tender who refused to open the bridge for us, but on showing our permit he soon came to terms, and we passed on till near sundown, and went into camp at Rocky Hill.

Aug. 12.—Although it was a pretty rough place we slept well and felt ready for the day's paddling ahead of us. This morning we started about seven o'clock and soon passed a number of boats, most of them being schooners. After paddling a couple of hours we came to the small city of Millstone, where we stopped for a few minutes, drawing quite a number of young men, who informed us that a couple of canoeists had just passed. Leaving the town behind we soon had the pleasure of meeting a canoeist and his son from Paterson, and after passing an hour or two very agreeably with them we passed on, as we wished to reach Perth Amboy by night. We soon arrived at New Brunswick where we entered the Raritan River at nearly low tide; after a hard paddle we reached what we thought a good camping spot near Perth Amboy just as the tide began to flow.

Aug. 13.—By the time daylight had put in its appearance we were satisfied that the mosquitoes were more at home here than we were, so left the place as soon as possible. We soon passed through Raritan Bay with a strong breeze which filled our sail and laid our boat well on her side, taking us up the Sound with flying colors, entering Elizabethport about 12 M., where we stopped for dinner, after which we soon entered Newark Bay, hoping to pass through it with the good breeze, but we were disappointed, for as we passed under the railroad bridge it began to blow a small gale and threatened rain.

We had gone hardly a mile when we were struck by a squall which nearly swamped us, but we got before the wind and ran up on the meadows, not stopping for anything, but jumping out over the deck and hauling the canoe clear up out of the reach of the waves, which were very rough. After spending a couple of hours very comfortably sitting on our boat in a heavy thunder shower, we concluded to try the waves again, as the wind had gone down a little, and it had stopped raining. At first the boat pounded considerably, but after we had passed the lighthouse the wind was more in our favor, and we arrived in Newark all safe, but very wet. We put our boat in a boathouse and started off to find our friends, for we intended to spend a few days in the city.

Aug. 20.—After spending a very pleasant week in Newark we started for home on Thursday morning. Entering the Morris Canal through the Deep Lock (near Center street) we passed under the market at Broad street and stopped at the High street plane and had our permit sealed and dated, then bidding good bye to some friends who had come to see us off, we soon left Newark behind and after an hour and a half of paddling we pass through one side of Bloomfield. Stopping a few minutes to fill our water vessel, we resume our paddling and soon reach Paterson, where we replenished our larder and took dinner just outside of the city. After stopping at Little Falls and viewing the falls and scenery, we got under way again. Reaching Boonton quite late in the afternoon, we found a very nice spot to pitch our tent near the town, and after supper we walked over to see the place, which did not take very long. We were soon tired of it and went back to camp.

Aug. 21.—We awoke early in the morning to find the air cold and damp, with indications of rain. After eating breakfast and packing away our dunnage we proceeded toward home and had no adventure of note until we crossed the plane east of Stanhope, and broke our rudder, which we had to repair when we reached Stanhope. After an hour's delay we were again on our way, not stopping (except for planes and locks) until we reached Hackettstown, near where we stop for the night. As it looked very much like rain we got out our rubber blankets, thinking we would surely need them before long,

but we were very agreeably disappointed as it did not rain where we were but passed to the north of us. Early the next morning we had our last meal in the woods, and it was eaten rather sorrowfully, for we both would have liked to prolong what had been a very pleasant trip. The country we passed through this morning was quite familiar to us and soon we began to see familiar faces at every lock and plane we passed, and had to answer innumerable questions, but cutting them as short as we could, we kept on until we reached Washington, the end of our trip of over 284 miles by actual measurement. Here ended our outing of 1885, and if nothing interferes we expect to make a more extended tour in 1886. THE CREW OF THE MISCHIEF.

A GOOD IDEA.

Editor Forest and Stream:

I beg to offer for consideration by the A. C. A. and its committees the following proposition:

Whereas, One of the chief impediments to general competition in the regattas by the majority of members has been the probability (almost certainty) that the prizes would be secured by members already known as experienced and skillful sailors or paddlers. Experiment (in 1883) has proved that the attempt to provide separate subdivisions in each race for these, complicated the programme beyond practical use. Yet the regatta aims and should aim to stimulate competition among this majority of members, especially to promote perfection of rig and equipment, and of skill among cruisers and general canoeists. Further, the regatta committee and its staff is charged with duties so onerous that they should be lightened rather than increased. Therefore, I propose to relieve the general races of the few insatiable experts by reviving the old distinction of "seniors" and promoting them into it. At the same time the regatta committee can be eased of further labors by allowing seniors to make up matches upon their own arrangements. Of course, it is not advisable to entirely separate the crack canoeists, so they should surrender not the right to race, but only the right to take the prizes.

I can hardly suppose that seniors will be reluctant to pass prizes in the general races; but in order to make it clear that it is a promotion and not a disqualification only, I suggest the giving of a pennant to sailors and flag to paddlers upon their attaining the distinction of winning four first prizes in either one (not both) of the methods of propelling a canoe.

On the other hand, it should be distinctly understood that members not so graduated are in no wise slighted. They should not be called juniors, and perhaps a better word than seniors can be found for the graduates to prevent any such inference. Champions will not do, because only one or two among them can be fairly entitled to that.

The adoption of this system can hardly fail to increase the interest among less fortunate racers to a very great extent. I hope it may in any case be tried. But the first need is discussion, and little time remains before the committees meet.

Now, my dear reader and comrade in canoeing, please take time by the forelock and hold him until you commit your ideas to paper for the printer. In the multitude of counsellors there is wisdom. The following is a draft of the necessary rules:

A. C. A. RACES.

1. Members who have won four first prizes in A. C. A. sailing (paddling) races shall be passed into a separate class, and shall be awarded in token thereof a white pennant (flag) with a blue star.

2. They will not be eligible for prizes in any regular programme sailing (paddling) race or for record, but will arrange matches by challenges with one another, and will select their judges and timekeepers for such events, who shall report them to the regatta committee, and arrange them with due regard to the committee's authority, and the regular sailing courses shall only be used at such times as the committee or their judges permit, so as not to interfere with the regatta staff, but rather to relieve them of excessive duty.

3. The members of the special class shall be known as seniors.

4. Seniors shall be entitled to enter and sail (paddle) in all races as heretofore, and their records shall be registered and announced, but the prizes shall be awarded in all regular programme races as if no seniors had competed.

5. Seniors shall be eligible to receive special prizes unless distinctly barred by the conditions of any such event.

6. Seniors may arrange for flags as prizes in their matches, and such prizes shall be presented to the winners at the regular presentation.

7. Any member not being a senior may, of course, challenge and race in such matches, and seniors shall have no privileges or rights over other members except to carry the pennant. R. W. GIBSON.

MOHICAN C. C., Albany, N. Y., Oct. 19, 1885.

WHY I DO NOT RACE.

Editor Forest and Stream:

I suppose I am the "friend of the humble, but convenient sneakbox" alluded to in your editorial of the last issue, who "fled ingloriously from the field with the assertion that, though his boat was the fastest, he was not a racing man," after the sneakbox canoe controversy of last year. Now sir, let me remind you that the controversy of last year arose from the query in your columns of a gentleman who wanted to know the best craft for cruising on open waters. You told him he wanted a canoe; I told him he wanted a sneakbox. Then a whole lot of us had a friendly squabble over it which ended by some canoe man challenging me to race—as if a race could determine which was the better for cruising purposes. When a man writes to FOREST AND STREAM to know what boat he shall buy for a racer, I won't put my oar in at all, for I never was in a race in my life, and have no sympathy with racers or racing machines; but when a cruiser asks for information my heart goes out to him at once with sympathy, for I am a cruiser myself, and if my thirteen years' experience of single-hand cruising in canoes, yawl-rigged sailboats and sneakboxes has taught me something that I can in turn impart to a brother cruiser, it affords me the greatest satisfaction to do so.

When a racing canoeist asserts that the canoe will outsail the sneakbox in the average weather encountered on open waters, he states what I know to be untrue. I have cruised in sailing canoes of the best model of the Nautilus, Shadow, Pearl and Sunbeam build, and also in sneakboxes. I am never in a hurry when cruising, but I have noted that my sneakbox has left the miles behind as rapidly as the fastest canoe I ever sailed, and in rough weather much more rapidly and far more comfortably. Yet I will not pit my sneakbox or Barnegat cruiser against a canoe in a race, and I will tell you why.

When I owned my first canoe (a Rob Roy) in 1872, there were very few canoeists in this country, and we followed the lead of McGregor, the father of canoeing, and were cruisers. We corresponded with one another, exchanged hints on outfits, etc., and initiated all our friends whom we knew to be lovers of grand old Nature into the quiet, gentle pastime of canoeing. Like McGregor, too, we were solitary cruisers. Sociable, company-loving fellows we were ordinarily, but there were times when, to appreciate and fully commune with Nature, and worship her in the solemn quiet of the woods and stream, we felt that to be accompanied by a chattering companion would be sacrilege. Therefore we loved the little canoe, which only permitted a solitary occupant. But some of the friends whom we initiated into canoeing also initiated some of their friends, and some of these last novitiates couldn't see "any fun" in poking around all alone in a boat. They didn't love the woods, and the rocks, and the marshes, and the streams for themselves, they only looked upon them as of a certain utility for picnicking, or for killing game. When they went cruising alone they were "lonesome," and therefore their cruises were short. They were nice fellows, all of them, but they didn't have it in them, that "it" which drives a man who is a true lover of Nature, a man who is neither a hermit nor a misanthrope, back once in a while into a state of semi-savagery to worship alone at the altar of great Nature, alone with his fellows the beasts, and the birds, and all wild things. Well, we couldn't put that "it" into these fellows, so we watched them with some dismay as they built tandem canoes that would carry two, and went off chattering and shouting together on what we called "picnicking" excursions. Then they tired of this and looked around for other uses for their canoes, and they took up racing. We watched them with increased dismay as they put on their craft such things as rudders and deck tillers, foot steering gears, innumerable ropes for downhauls, topping lifts, reefing lines, forestays and backstays, with decks covered with cleats and blocks. When they also introduced tabernacles, double centerboards and lead-weighted keels we said, "Well, such things as these can never be called canoes, after all. Why should we grieve? Our little simple craft will still and always be *the* canoes, and these racing machines will have to take another name." But we were mistaken. The men who couldn't see "any fun" in poking around all alone in a boat were numerically in the ascendant. They called their machines "canoes," and canoes they still remain. We old fellows (old in canoeing, I mean) know that for racing these machines are well enough, and that for sailing or paddling about a harbor of an afternoon they will do; but we also know that for cruising on small streams they are too heavy and cumbersome, and for cruising on open waters they are too dangerous and uncomfortable. What we do not like is the application of the term "canoe" to these craft. We have seen "canoeing" degenerate from a romantic, quiet, cruising pastime to a hurly-burly, helter-skelter racing sport; and naturally we are sore over it. We confess it; we are, if you like, "sore-heads," just as the devoted musician might be if his beloved Cremona were used by a multitude of sports as a base ball bat, and if these sports, who couldn't see "any fun" in music, should therefore call themselves violinists. I am one of these sore-heads, and that is why I will not race.

I object to your calling the man who enters for the International Challenge Cup a canoeist, and placing me alongside of him as the canoeist's critic, and therefore, presumably, not a canoeist. I am canoeist's critic, and therefore, presumably, not a canoeist. I am still and always a canoeist, and shall never criticise true canoeing. You will hardly class McGregor as an anti-canoeist, yet when McGregor cruised in the open waters of the Channel and the French coast he did so in a flush-decked yawl 21x7x3. Did you ever hear of the father of canoeing taking part in a race?

N. H. Bishop is the "father" of the A. C. A., and a solitary canoe cruiser like McGregor. Yet when he cruises on open waters he uses a sneakbox, as he did on his memorable voyage down the Ohio and Mississippi and through the Gulf of Mexico.

"Nessmuk" has probably done more canoe cruising than any man in the country. Yet he uses the simplest form of canoe, simpler than those of McGregor and Bishop, because it has no deck. Do you think if "Nessmuk" were to cruise through the great lakes or the Gulf of Mexico that he would do it in one of the machines nowadays styled canoes, with lead keel, tabernacle and complicated gear? In my opinion he would use either a Barnegat cruiser or a sharpie.

I give these three instances because they are canoeists known by repute to every man who handles a canoe; but if you will con over in your mind the men who cruise in canoes for the love of nature, and hence go alone, who are not "hotel cruisers," but men who stay out when they go out, rain or shine, you will find that these men do not enter races for cups; that they adhere to the same simplicity in a canoe that McGregor's Rob Roy had and still has, and that when they cruise on open waters they do it in some other kind of craft.

I still own, after a trial of all kinds of canoes, my ideal of the perfect cruising canoe, the Rob Roy Gypsy; but when I cruise on the open I find the Barnegat cruiser the "some other kind of craft" that suits me best. SENECA.

AN EXPERIENCE IN A SQUALL.—A correspondent of Dr. Neidé's sends the following account of a novice's experience in a squall which may serve as a caution to others who are just learning to use centerboards. We have seen several similar cases where the boards have been badly damaged and even the keel and garboards injured by beaching the boat with board down: "I have had a delightful time with my boat and tested her so thoroughly, disproved so many derogatory estimations of her that I can fully understand your meaning to the remark that you 'fairly loved your boat.' I did not sail from New Orleans but have used my craft all along the eastern shore. That she has been admired, praised and her value guessed at, you may well be assured. I shall never forget the scene the evening I first launched her on the bay. The entire number of guests at the hotel, with the denizens living 'along shore,' lined the wharf, and my start off was in a moderate gale and a heavy sea. To me at the time it was an exciting moment, but I came through creditably. I must explain to you why it was I did not house my centerboard. In the morning I was sitting patiently eying a cork in the trustfulness that something would pull it down or eat the rod up, when a sailor friend addressed me, 'I say, Mr. K., what is all this nonsense I hear you have been telling these people you could go to windward?' The crowd standing on the wharf laughed in great glee at this mode of attack, and I, quite nettled, bet $50 I could point within two points of where his cat rig, an 18-footer, pointed. So with considerable chaff we finally arranged that we would try it, and I immediately invited the heaviest man in the hotel to sail with me. He weighs at least 210 pounds and 6½ft. high. About a half an hour before time I hoisted sail and got ready in spite of the heavy squall coming up and white caps rolling in with a big surf. My heavy weight not with me but coming in on the steamer just landing. The squall struck me like a blizzard, and without a reef in either sail you can imagine how I climbed over and went through the water. It was coaming down and 195 pounds to windward. Heavy weight and the lawyer stood on the wharf and watched me, and the brilliant idea seized me as I grit my teeth if I can only make a successful jibe I will convince that duffer my boat can do something. I took my chance between two puffs, jammed hard down and the tiller split the yoke, or rather tore away one side of the notch. It was all hands lively then, and as far aft as possible; the jigger flew around, sheet rope eased off, and then the mainsail quivered, hesitated, and got over on the other side about as quick as anything I ever saw. The jibe was done, and in grand style, and I was calculating how long she could stand the terrible pressure on the bow, when a flaw, and then whizz, and the tornado had me. The lower jaw on the mainsail gave way, and like a seagull wounded and folding its wings the boom started a curl on the top of the mast. The shore was a quarter of a mile distant, and no mistake. Hard-a-lee with one leg as a backwater, and antics of a tight rope walker, till within water shallow enough to go overboard and unship foremast. As I walked ashore through surf Heavy Weight came down to me and we jerked the boat up out of serious danger, but alas the centerboard had been forgotten. I have had the most amusing adventures. One was while my sails were up drying, three female pirates in bathing costume untied the boat from the stake and proceeded to cruise over sandbars, stakes, etc., and answered the troubled skipper ashore with, 'Go way you horrid thing,' and 'We will never speak to you again.'"

SPRINGFIELD C. C. RACES.—The report of the Springfield C. C. regatta was received too late for insertion this week.

Answers to Correspondents.

☞ **No Notice Taken of Anonymous Correspondents.**

KELPIE.—The season for deer in Lower Peninsula of Michigan begins Oct. 1.

E. D. B., Kissimmee City, Fla.—Is the sheldrake a North American bird? I do not see it in Coues, hence this question. Ans. Yes; the name is given to several birds of the genus *Mergus*—round-billed fish-ducks—but is most commonly applied to the red-breasted merganser (*M. serrator*).

JAY BEBE, Toledo, O.—Is there any reliable test by which the male ruffed grouse can be distinguished from the female? To say that the plumage of the female is the same as the male, "only a little duller," as do some of the books, amounts to less than nothing, where birds of widely different localities are compared. Ans. We know of no certain method by which the sex of ruffed grouse can be determined except by dissection.

L. J., Tunkhannock.—Does the black bass spawn twice a year or not? I caught four last week, Oct. 11, that had eggs in them nearly ready to spawn. It is evident that some of the bass spawn in the spring and some in the fall, or else twice a year. Ans. The black bass spawns in May and June, possibly a few late ones in July. The eggs you saw in October were probably developed for next spring's spawning. This fish is not active in the winter in Pennsylvania, and to judge of the ripeness of eggs is often a difficult matter to one not a practical fish-culturist. We know nothing of any black bass spawning in October or later.

FORESTS AND CLIMATE.

THE third number of Petermann's "Mittheilungen" for this year contains an article by A. Woeikof on the influence of forest on climate. The commencement of a scientific investigation of this subject was made when the Bavarian forest meteorological stations were established, and when Prussia, Alsace-Lorraine, France, Switzerland, and Italy followed the example. As a general rule it may be laid down that in the warm seasons as between forests and places close at hand which are treeless (1) the temperature of the earth and air are lowerd in the former, (2) their variations are less, (3) the relative humidity is greater. After examining observations as to evaporations, Herr Woeikof states that the influence of forests in diminishing evaporation from water and the soil is so great that it cannot be accounted for alone by the lower temperature of the hot months, the greater humidity, or even by the shade. An important influence, which has hitherto been but little appreciated, is the protection from the wind afforded by the trees, and this the writer regards as more important than all the others together in reducing the degree of evaporation. With regard to the influence of forests on rain and snow-fall, there is yet only a single series of observations supplying comparative statistics, and extending over a sufficiently long period. These were taken in the neighborhood of Nancy, and they show an important influence of forests in increasing the rain-fall. It might appear that the effects of forest on rain in the climate of central Europe in winter would be small, for the difference between the temperature and humidity of the forest and the open is very little, and the quantity of moisture in the atmosphere is small. But the observations show that it is more at this time of the year that forests get much more rain. This the writer attributes to the clouds being lower, the resistance which the forest offers to the movement of the air and to the moist west wind. Forests retain rain by the undergrowths of grass, moss, etc., much better than open ground, and let water off superficially only after a heavy rain-fall; the remainder filters upward slowly, and much of it is used for the evaporation of trees. Although forests, especially thick, luxuriant forests, cannot exist without certain supplies of moisture, yet it is the same to them when the supplies come, for they retain what they get, and use it over a long period. One example of this is the Lenkoran forest, on the west coast of the Caspian, where the vegetation is more luxuriant than in any other part of Europe, yet very little rain falls in summer, but the rain-fall in autumn and winter is great. The water is stored up by the forest, and is used in evaporation during the heat of summer. Humidity of the atmosphere, however, is not inconsistent with a high temperature, as the Red Sea shows; but in the forests the humidity is due to the evaporation of the leaves—in other words, to a process by which heat is converted into work, and hence the coolness.

Herr Woeikof then endeavors to ascertain the influence of forests on the climatic condition of their neighborhood of the western parts of the Old World, between the 38th and 52d degrees north latitude, the place selected being in all cases in the open. Thus for the 52d degree eight stations are taken between Valencia in Ireland on the west and the Kirghiz steppes on the east; for the 50th, Guernsey on the west, Semipalatinsk on the east, and 13 stations, and so on for each two degrees of latitude, to 38 degrees. The general result of the observations in 50 stations in six different degrees of latitude, is that in western Europe and Asia large forests have a great influence on the temperature of places near them, and that by their influence the normal increase of temperature as we travel eastward from the Atlantic ocean to the interior of the continent is not merely interrupted, but they give places far removed from the coast a cooler summer than those actually on the sea. A striking example of this is Bosnia. An examination of the statistics show (1) that in Bosnia the summer is 2.5 degrees to 4.5 degrees cooler than in Herzegovina; (2) even on the island of Lissa, in the full influence of the Adriatic Sea, the summer temperature is more than a degree higher than that of Bosnia, which is separated by lofty mountain ranges from the sea. Bosnia owes this comparatively cool summer to its great forests, while Herzegovina is almost disafforested. To sum up: Forests exercise an influence on climate which does not cease on their borders, but extends over a larger or smaller adjacent region according to the size, kind and position of forest. Hence man by afforestation and disafforestation can modify the climate around him; but it is an extreme position to hold that by afforestation the waste places of the earth can be made fertile. There are places incapable of being afforested, which would not give the necessary nourishment to trees.—*Nature.*

POT LUCK FROM EXCHANGES.

Hooking and lying are the fishermen's crying sins.—*St. Paul Herald.*

The father of lies—A fishing expedition.—*Pittsburg Chronicle-Telegraph.*

Amateur Fisherman to Owner of Pond—"You said there were plenty of fish here." O. of P.—"There are millions of 'em." A. F.—"Then I must say they are very stupid." O. of P.—"Stupid?" A. F.—Yes, they don't seem to catch on."—*Boston Courier.*

Professor Brugsch has just returned to Berlin from Persia, where he spent some time collecting notes and material for a work on that country. The Persians are very fond of wild beasts for pets. One day the Professor met on the sidewalk a man leading a full-grown lion by a rope; and such sights he says are not uncommon.

George Washington went fishing at least once. And on that occasion he caught a trout four inches long. While down at the corner grocery in the evening, after returning from his angling tour, he was asked how much the trout weighed, when he uttered those memorable words, viz: "I cannot tell a lie. It weighed seventeen and a half pounds."—*Norristown Herald.*

The Berlin Aquarium has at last accomplished the difficult feat of showing a school of live herring in its sea-water basin. These fish are so delicate that when caught in their native element even a moment's exposure to the air will kill them. They had therefore to be caught under water and to be carefully transported from the seaboard. Ten out of the nineteen which were taken in the Baltic, near the Island of Rügen, reached Berlin alive.

A remarkable circumstance is reported from Whitstable, England, by a local naturalist. Recently two or three oysters were put away in an earthen pan, and during the night a couple of young mice found out the dainty dish and inserted their hungry mouths within the open shells of one of the bivalves. In the morning they were found fast held by the closed shell of the oyster, and of course quite dead. The oyster continued its firm hold on the intruders, and the trio having been handed to Mr. Sibert Saunders, a member of the East Kent Natural History Society, were at once immersed in spirit, and will in due course be placed in the local museum.

The eels of the ponds in the woods of Vincennes, France, leave them every spring in large numbers, making their way to the Seine or the Marne, several kilometres distant. They take advantage of rainy weather, when the herbage is wet, and their instinct guides them directly to their destination. New species have been repeatedly introduced into the lakes, but in vain; all seem to have this disposition to leave. Some have thought that the water of these ponds, having been collected by hydraulic engines, has undergone some change which drives the eels away. But the phenomenon of such migrations by eels and some other fishes is not uncommon. Thus in the marshes of Picardy eels are often found on the grass, going from one pond to another.

A sudden and melancholy ending (the Paris correspondent of the London *Daily Telegraph* says) has befallen the lion Sultan, who so imprudently broke away from his cage and took to inhaling the sea breezes on the beach of St. Brévin l'Océan. His keeper spent three days scouring the country in search of him, but without any result. Sultan, however, unfortunately for himself, was observed roaming about the beach by three bathers who happened to have guns in their possession, having come out on a shooting excursion, preparatory to which they were enjoying a swim. Alarmed at the extraordinary apparition of the wanderer, they ran for their guns and discharged a volley of slugs and shot at the unlucky beast. Sultan succumbed to his wounds in a short time, and was borne away from St. Brévin in a cart, amid the wonder of the inhabitants.

The following curious freak of some water rats was observed by a Plymouth gentleman a few days ago in the Exeter canal. On the side which he was walking a dead dog was lying in the water. A rat emerged from a hole on the opposite side of the canal, and, taking to the water, appeared soon to be sniffing something. The rat at last reached the dog, and after smelling about it a short time, appearing quite satisfied with its examination, swam back again to its hole. Our correspondent then moved the dog with his stick a short distance from where the rat examined it. Presently, the rat again emerged from its hole, followed by several other rats. They all took to water, led by the pioneer, and swam across to where the dog first lay. The leader again indulged in sniffing around in an excited state. He swam round about the spot for some little time evidently hunting for the dog. At last the poor rat seemed completely

puzzled as to what had become of his and his friends' dinner? He appeared to give up his search, and gave one long ann piercing scream, which quite startled the observer: and in ae instant the other rats set upon the leader and killed him. Th poor thing seemed aware of what was awaiting him. He had apparently told them a lie, had led them out on a false errand, and for this it was death by Rat Law.—*Western Morning News.*

An experiment of much interest is now being made by the maritime province of Canada in the introduction of live lobsters to the English market. The steamer Clifton, from Miramichi to England, recently took out a tank containing 500 live lobsters, and if they reached England in good condition a large buisness is expected. There is already considerable trade with Great Britain in preserved lobsters. Although the fishery was almost unknown in Canada ten years ago, it is now third in point of importance. It is carried on in over 600 factories, which send annually to British, United States, and other markets between 16,000,000 and 17,000,000 cans, representing a value of between two and-a-half and three million dollars.

A Russian paper gives an account of the circumstances which have led to a most unique lawsuit. A rich lady at her death placed her pet dog Gypsy in the hands of a friend, with the request to provide for her with the annual interest on 1,000 rubles, set aside for that purpose in her testament. The other day Gypsy died, and the lady who had charge of her took it for granted that the money was now her own. Another lady, however, appeared on the scene, who owned a son of Gypsy, and who claimed that her dog was heir to the income of the 1,000 rubles, since nothing was said in the testament regarding the disposal of this money after the death of Gypsy. The result of the trial will be awaited with interest.

An Opportunity to Study Sharks.—The *Ceylon Observer* of the 13th of June gives the following narrative of the only survivor of the steamer Speke Hall, which recently foundered: "When I came to the surface after being washed off the bridge, I and Quatermaster Usher were clinging to the same lifebuoy, and I saw the funnel of the Speke Hall just going under water. Boats and everything had been smashed to pieces and washed away; and, indeed, if the boats had been available, they would not have lived in such water. Catching a spar, I abandoned the life-buoy to Usher. It was dark at the time, and I could not see him, and I saw nothing more of him or any one else. At daylight I managed to secure another spar. I lashed the two spars together with my belt, crosswise, so that I was able to sit on the centre. I could not have held on much longer to the single spar, because every now and then the spar would fall above me, and my head would go under water. When daylight set in the sea and the wind had gone down, it came on to rain. I had a sou'wester on, luckily, and I held it up till I caught about a cupful of water. I believe that saved my life; for I had swallowed a good deal of salt water, and my mouth was parched. I saw nothing that day except pieces of wreck floating about. On the morning of the second day I saw the smoke of a steamer a long distance off. She passed on without seeing me. I saw one or two others during the day, but they were too far off. About the middle of the second day a shark came rushing along at a great speed. It was not a very large one—about nine feet long. I was sitting on the cross-piece with my feet underneath. The shark rushed over one piece of wood, and I fancy he got the other arm of the raft in his teeth, because he stopped suddenly. I had a piece of stick about three feet long which I picked up, thinking it might be useful for hoisting my cap on as a signal. I poked him with this stick and he cleared off at once, and I never saw anything more of him. That night a steamer passed quite close to me. I could see all her lights, but, the night being dark, she did not observe me. I hailed her, but she was too far off to hear me. I dozed off once or twice, but whenever I dozed, I fell into the water. I didn't feel much inconvenience from the sun. My hat saved me. On the morning of the third day I saw a steamer and a sail. I took my coat off and hoisted it on a stick, and tried to attract her attention. She altered her course, and came staight toward me, and I fancied she had seen me; but presently she altered her course, and steered away from me. I had almost given up hope then. Later in the day another and much larger shark visited me, but did not come within circle of the raft. He was a tremendous fellow, twenty feet long at least, and I gave myself up for lost when I saw him. Nothing more occurred till the evening. The sun began to get low, and I could not see anything all around the horizon, and I made up my mind for another night. I must have gone off into a longer doze than usual, for I fell off the raft on my face, and when I got up again the French steamer Periho seemed close on me, as if it had sprung out of the water. I had nothing to signal with but my hat. I held it up as high as I could, and one of the soldiers on board saw me. A boat was lowered and an officer and four men came over to me, and took me on board, where they treated me very kindly."

Lieutenant Allen's Journey on Alaskan Rivers.—Chicago, October 15.—General Nelson A. Miles, who is in the city, received a telegram yesterday from Lieutenant Henry T. Allen, of the Second Cavalry, stating that he had arrived safely at San Francisco after his Alaska explorations, having completed a journey through the regions of the far north which in the opinion of General Miles excelled all explorations on the American continent since Lewis and Clarke, and the world's record since Livingston. Lieutenant Allen left Sitka last February and journeyed to the mouth of the Copper River, which he followed until he reached the great Alaskan range of mountains. These he crossed on snow-shoes to the head of the Tennah River—in itself a marvelous accomplishment. For 700 or 800 miles he followed the Tennah until it emptied into the Takon, the great river of the North, and that to its mouth, a distance of 400 or 500 miles more. Upon the completion of his great journey, Lieutenant Allen repaired to Fort Michel, on the Behrings Strait and returned on the steamer Corwin. The exploration of the Tennah and Takon Rivers has been the ambition of explorers since long before Alaska came into the possession of the United States, but the Russians failed each time it was attempted. Since then, several explorations by American officers have ended in failure, until among the army officers of the Pacific Coast the feat came to be considered well nigh impossible. Lieutenant Allen's companions were a sergeant and an officer of the Signal Corps, together with the Indians whom he persuaded to join him.

Jacob Beller of Hamtramck, away back wherein the memory of man runneth not to the contrary, became the possessor of the original bear which prowled over the present site of Detroit when forest trees grew in the streets and Indian canoes were the only aquatic vehicles which disturbed the waters of the river. The animal, at the time it came into Mr. Beller's possession, had reached the prime of life but has nevertheless furnished lessons in natural history to every generation of Detroit small boys. As time passed on, the bear began to feel the irritability of age and within the past year has manifested so much petulance that a duly appointed committee finally examined it and agreed in the verdict that the animal was no longer in its right mind by reason of its weight of years. Mr. Beller was advised to kill his venerable pet as a precautionary measure against it killing some one else. An old Rocky Mountain hunter—Mr. Charles L. Schmitt—was employed to do the slaughtering. He recognized, with the prescience born of long experience, the difficulties he would have to encounter. Age had hardened the skin and flesh of the bear until they were as impregnable to ordinary weapons as though hewn out of solid boiler iron. Mr. Schmitt, however, owns an ancient blunderbuss he claims to have found in the fastnesses of the Rockies, clutched in the skeleton hands of what was evidently the last of some pre-historic race of giants. This weapon he charged with dynamite, gunpowder and one dozen bullets nearly the size of grape shot. On Friday afternoon he entered the inclosure which imprisoned the old bruin, placed the muzzle of the weapon close to the bear's eye and pulled the trigger. The experiment was in every sense a great success. When the din and smoke of the explosion cleared away and the little crowd of spectators recovered consciousness, the old bear was seen stretched out before them. The balls, a post mortem showed, penetrated far enough into the skull to cause death. The carcass was immediately purchased by Mr. F. X. Kolb of Michigan Grand avenue, who, as s oon as he can get the machinery necessary to cut it into steaks and roasts in working order, will serve it out to the patrons of his establishment.—*Detroit Times.*

"Tis sweet to sit on the verdant bank,
Between two mossy boulders,
And to feel a bite at the end of your line,
And another between the shoulders.—*Ex*

Tuesday last two Indiana mine sports, Joe and Pete, borrowed a gun from a friend and started off in search of a deer. They hadn't gone far before one was sighted. A cartridge was produced which they tried to force into the muzzle of the gun, but the dodgasted thing wouldn't go down. Joe, who is a Cornishman and had seen the militia in the old country tearing off the end of the old-fashioned paper cartridge with their teeth, tried the method on the one he held in his hand. He chewed, and chewed, but to no purpose, and in the struggle finally broke one of his teeth off short. Then Pete, who is from Canada and don't know any more about a gun than a horse knows about his grandmother, tried his hand at it. He got a club and tried to drive it in, but after pounding until he had battered the cartridge out of all shape gave the job up in disgust. In the meantime the deer had got tired of waiting and left. The two finally concluded that the fellow who gave them the cartridges made a mistake, they were too big for the gun. So they returned to the location to get cartridges that would fit. The trees out that way are said to be laughing yet—the gun was a breechloader.—*Norway Current.*

An American Makes Trouble.—Glasgow, Scotland.—While England is having its unsavory social scandals, and Ireland its perennial land agitation, Scotland is being wrought up by a matter of equal importance and magnitude. An American is the disturbing element, and if all reports are true the average Irish landlord could not be more aggressive. This gentleman is lessee of one of the largest deer forests in Scotland. It is situated at Kintail, Ross-shire, and comprises about 220,000 acres, the rental of which is about $100,000 a year. The man arrogates to himself the privilege evicting the tenants from the few farms in the huge tract, so that it may all be devoted to the sport for which he pays so well. Naturally this action is provocative of intense indignation. The quantity of land converted into deer forests since 1860 is about two million acres. The ordinary farm rental of the moor is one shilling per acre, while if cleared for deer it is nearly or quite twice that sum. To show the difference an illustration may be used. The Duke of Sutherland is the largest landed proprietor in the highlands, owning and renting 1,326,453 acres. The income yielded him by these estates is about $325,000, or one shilling per acre over all. The American tenant already alluded to pay $100,000 for 220,000 acres. Notice the difference, and do not wonder that the people strongly object to the present system of converting the land into forests for preservation of deer and game. It was alleged that the obnoxious Brooks has deprived people of their lands to such an extent that they found it to their interest to leave, until even the lands previously cleared for large sheep farms are now run upon by deer. The commission, after hearing the complaints in full have arrived at the decision that from the forests gain has accrued to the proprietors and their dependents, and no injury has resulted to farming and to farmers, but that there is a limit beyond which the extension of the forest system should not be permitted to go. They recommend that further appropriation of land to such purposes be prohibited below a prescribed contour line of elevation. The result is that the reformers are not satisfied, and everywhere is heard the peculiar howl for disafforestment. Meanwhile the "ould Yank at Kintail" is determined on having the eviction go on. —*Hartford Times.*

The St. Lawrence Gang.

(Pat. England and United States, 1881.)

This cut shows No. 1-0 (or Black Bass size) with living Minnow attached.

MANUFACTURED IN ALL SIZES FROM No. 5-0 TO No. 4, SUITABLE FOR

Muskallonge, Pickerel, Black Bass, Lake Trout, Etc., Etc.

All have patent treble hook with baiting needle, adjustable lip hook and treble swivel, and best silk metal wound gimp.

This is the most ingenious invention and radical improvement in trolling tackle yet made. Its manifest superiority to all gangs now in use is evident to every expert angler. A few of its peculiar excellences are:—It is the only gang on which a bait can live. It is the only gang which can be adjusted to any sized minnow instantly and perfectly. It is not only the simplest but also the strongest gang made. It does not scare away the big and wary fish by a long array of treble hooks. The treble swivel insures perfect revolution of bait and reduces to the lowest possible point the liability of kinking the line.

If your dealer does not keep our goods in stock, or will not order them for you, send 50 cents for our 128-page folio illustrated catalogue.

SMALL YACHTS.

Their Design and Construction, Exemplified by the Ruling Types of Modern Practice.

By C. P. KUNHARDT.

The Forest and Stream Publishing Company takes pleasure in announcing the immediate publication of a magnificent folio volume, bearing the above title. This book is intended to cover the field of Small Yachts, with special regard to their design, construction, equipment and keep. The opening chapters are devoted to a consideration of the model and the draft, their relations to one another, and the purposes which they subserve. Full directions are given for producing the plans of a yacht with reference to the chief points in design, and the method of taking off the lines of a boat already built is likewise described in detail.

All elements entering into design, such as Resistance, Stability, Balance of Rig, Handiness, Displacement, etc., are dealt with in separate chapters. The rules necessary for the mathematical computations, and a review of theory and practice close the first division of the book.

The second portion comprises the description of the Plates, covering the whole range of type in small yachts, from the shoal catboat and American centerboard sloop to examples of the narrowest and deepest British cutter yet built. These yachts have their lines, build and fittings depicted in the Plates, which are drawn to scale. With their aid and the specifications presented, the reader is placed in possession of accurate information concerning the mould, accommodations, rig and characteristics of all styles of yachts which have received favorable recognition. Sporting boats, combination row and sailboats, and various examples of special form are introduced.

The third division offers a comprehensive review of single-hand sailing, to which small yachts are especially adapted. Directions are given as a guide in selection of type and sail plan, and subsequent equipment and proper management.

The iron work of yachts, their gear, yawls, stearing apparatus, boat building and much other closely related matter is entered upon. The new International Rules of the Road, Signal Service, and a bibliography appear in the Appendix.

The work is profusely and handsomely illustrated with 150 illustrations inserted in the text, besides the sixty-three plates as follows:

LIST OF PLATES.

I. The Sloop Yacht Schemer.
II. The Nuckel.
III. The Windward.
IV. A Newport Catboat—Portable Catboat.
V. An Eastern Catboat.

"FOREST AND STREAM SERIES."

DEER HUNTING.

BY JUDGE JOHN DEAN CATON.

BY and by it will be time to hunt antelope and deer. It is always time to read about them. Judge Caton's book on the antelope, elk, deer, moose and caribou of America discusses in a readable way the life history of these animals and the methods of their capture. It is the work of an enthusiastic sportsman who has had a wide experience and has devoted the leisure of years to studying these interesting game animals. The volume is very fully illustrated, and is a perfect storehouse of information and entertainment. The first edition was sold by the Boston publishers at $4. Price $2.50.

WOODCRAFT.

BY "NESSMUK."

A COMPACT pocket handbook of condensed, boiled-down, concise, clear, comprehensive, sensible, practical camp gumption. "Nessmuk" has been "in the woods" in Michigan, New York, Pennsylvania, and South America, and this is a book for outers, wherever they kindle their camp-fire. The author believes in "smoothing it." He has learned how; now he tells others. It is much easier to learn from "Nessmuk" than from Dame Experience. We should not be surprised if "Woodcraft" completely revolutionized the methods of camping out. If you are going to the woods, read "Woodcraft" before you go. It may add to your trip a hundred fold. Price $1.00.

DOG TRAINING.

BY S. T. HAMMOND.

HE was a promising puppy, and when you turned him over to the breaker to be educated, you thought he was bound to make "the best dog in the world." And you'll not soon forget how disappointed and disgusted you were when the dog, the breaker and the big bill—all three turned up together, and you saw that the animal's spirit was broken and it would take a steam calliope to make him mind. Now, this could not have happened if you had been wise enough to buy a copy of Hammond's book, and in your odd leisure moments *train* the dog yourself instead of having him *broken* by some one else. We are selling edition after edition of this book, and it is revolutionizing the system of preparing dogs for work in the field. Price $1.00.

SHORE BIRDS.

A PAMPHLET for those who "gun" along the shore. Tells of: I. Haunts and Habits—Where the bay birds live and what they do at home. II. Range and Migration—Where they go to breed and where to spend the winter. III. A Morning Without the Birds—An episode of shore shooting. IV. Nomenclature—A list of our American species of *Limicolæ*, with a description of each species. V. Localities—Where to go to shoot them. VI. Blinds and Decoys—How to shoot them after you have reached the grounds. 45 pp., paper. Price 15 cents.

ANGLING TALKS.

BY GEORGE DAWSON.

AS a political writer of conceded power, Mr. Dawson wielded a trenchant pen; when he terned from the conflict of parties to the praise of the favorite pastime of "simple wise men," his essays, limpid as the crystal streams, are aglow with the soft summer sunlight and melodious with the songs of birds. When angling was the theme, he wrote from a full heart and in closest sympathy with the scenes and pursuits described. These "Talks" are brimful of manly, wholesome sentiment; there is in them all not a particle of cant. Their sincerity and overflowing spirit at once win the reader, and he perforce shares the author's enthusiasm. The effect is magical, like that of the mimic players in Xenophon's *Memorabilia:* he who reads, if he be an angler, must go a-fishing; and if he be not, straightway then must he become one.—*Extract from Publishers' Preface.* Cloth, price 50 cents.

CANOE "AURORA."

BY DR. C. A. NEIDÉ.

A CHARMINGLY written and always entertaining account of a canoe cruise from Lake George, New York, down the Ohio and Mississippi Rivers to the Gulf of Mexico, by the Secretary of the American Canoe Association. To read the cruise of the "Aurora" is the next best thing to having made it; and the reading is decidedly more pleasant than would have been participation in some of the misadventures related. 216 pp., cloth. Price $1.00.

F. A. ALLEN'S SPECIALTIES.

MONMOUTH, ILL.

ALLEN'S DUCK CALL—Improved, Nickel Plated; the most natural-toned, easiest-blowing, smallest and only Metal Duck Call ever invented and the only one that perfectly imitates the *wild* duck. Sent by mail on receipt of $1.

ALLEN'S BOW-FACING OARS—Can be attached to any boat in five minutes, shipped instantly in the roughest water; work much easier than the common oar. In duck shooting they are invaluable; you see the bird the instant it leaves the water. Sent by express on receipt of $8.

ALLEN'S SHELL SWAGE—Will reduce brass shells to their original size in one-half minute, making them as smooth and solid as when new. On ordering mention gauge wanted. Sent by express for $1; by mail $1.30.

ALLEN'S DECOY DUCK FRAME—Is a simple device for holding the dead duck in a natural position in the water. Price $4 per doz. SEND FOR CATALOGUE FREE.

CANOE HANDLING.

By C. B. VAUX ("DOT").

A complete manual for the management of a canoe. The author begins at the very beginning, describes and explains the rudiments in the simplest and plainest way possible. Everything is made intelligible for beginners: and besides this A B C teaching there are so many hints and wrinkles that the oldest canoeist afloat will find pleasure and profit in the study of these. The book is complete and concise—no useless duffle between its covers. The subjects treated are the choice of a canoe, paddling, sailing, care of the canoe, recipes and rules. The text is further elucidated by numerous practical drawings, and the beauty of the book is enhanced by the many ornamental vignettes. Pages 168; uniform with "Canoe Building." Price, postpaid, $1.00.

CANOE

THE FOREST AND STREAM began a year ago the publication of a series of papers on canoe construction, by Mr. W. P. Stephens, of the New York C. C., widely known as an expert on canoe design and building. These papers, having appeared through the year in our columns, have since been rewritten, and with numerous additions are now published in a handsome volume under the title of "Canoe and Boat Building for Amateurs." Mr. Stephens is peculiarly fitted for the preparation of such a work, beginning as an amateur, and having after a long experience of the difficulties attending a learner, taken a prominent place among canoe builders, due both to the model and workmanship of his canoes. Realizing fully the difficulty of examining to a novice an art in itself far from easy,

AND

and with which he is entirely unfamiliar, the book begins with a description of the various classes of canoes in general use, with their main features and dimensions, and definitions of the terms used in connection with them. Numerous examples of canoes are given, and in connection with them, such plain instructions in designing as will enable the beginner to select intelligently the proper craft for his pur-

BOAT

pose, and to plan her dimensions, details and fittings. To this end designs of all classes of canoes are given, with full dimensions and details. The object has been not merely to enable the tyro to build one boat as described, but to teach him the principles of designing and building in such a way that he may construct such a craft as he desires. Following the chapters on designing, the construction of a canoe is taken up in detail, the tools and appliances being first clearly described, as well as the various materials, after which follows the actual work of building. Every operation is taken up in order, from the selection of the keel to the varnishing of the finished boat, and illustrated with numerous diagrams.

A chapter on sails describes all the varieties in use by canoeists, down to the new Mohican settee, with directions for making, rigging and measuring them, while the method of proportioning the sails to the boat is clearly explained, all the calculations

BUILDING

being worked out in detail. The many minor points of a canoe, paddles, steering gears, rudders, aprons, and camp outfit are also described at length, while a chapter is devoted to canvas canoes.

The subject of boat building is fully treated, a rowboat of the usual construction being taken as an example, and described in all its parts in such a manner as to make clear the principles involved, and their application to any form of boat, either lapstreak or carvel build. Each of the numerous technical terms belonging to the subject is defined clearly when it first occurs, and as the index is full and complete, the book is in itself a glossary.

In addition to the numerous diagrams in the body of the work, twenty-four large plates are printed on bond paper, containing the working drawings of canoes for paddling, sailing, cruising

FOR

and racing, with their sail plans, rowing sailing boats, large canoe yawls, and various boats for special purposes, such as gunning boats, yacht boats, and the widely known sneakbox.

The canoe yawl, a boat between a canoe and a yacht, is illustrated by examples of various craft from 17 to 20ft. long, and suitable for a crew of two or three on a cruise. This class of boat, while little known among us as yet, is admirably fitted for cruising, and will meet the wants of many who object to a canoe as being too small, and yet desire a boat with the same excellent qualities. The boats and canoes illustrated are in all cases among the best of their class, the list of canoes including English, Scotch and American craft, and are all drawn

AMATEURS.

to scale, so as to be available as working drawings. The plates, for convenience in using, are placed loose in a tough manilla envelope and accompany the book.

Pp. 168, with 24 plates of working drawings. Price $1.50. Address,

Canoe and Camp Cookery.

By "SENECA."

A practical cook book for canoeists, Corinthian sailors and outers. Practical because the author gives explicit and intelligible directions for preparing such dishes as he has himself actually tested in camp and on a cruise. This is just where the recipes differ from the absurdly impracticable dishes given in some so-called camp cookery books. The cooking outfit is described, and numerous hints on camp economy add to the value of the work. Cloth, 96 pages. Price $1.00.

FOR SALE.—TEN VERY FINE BRED FOXhound pups, bred from Bryn Mawr Kennel. Address JOHN L. MATHER, Bryn Mawr, Pa. oct22,2t

PURE COCKER SPANIELS.

Two fine liver, white and ticked cocker bitch pups, 6 mos. old, full pedigree, for sale cheap; first-class stock. Write for particulars and pedigrees. Address E. HOLLEY, JR., Liberty Kennels, Rhinebeck, N. Y. oct22,2t

FOREST AND STREAM.

A WEEKLY JOURNAL OF THE ROD AND GUN.

TERMS, $4 A YEAR. 10 CTS. A COPY. SIX MONTHS, $2.

NEW YORK, OCTOBER 29, 1885.

VOL. XXV.—No. 14. NOS. 39 & 40 PARK ROW, NEW YORK.

CORRESPONDENCE.

THE FOREST AND STREAM is the recognized medium of entertainment, instruction and information between American sportsmen. Communications upon the subjects to which its pages are devoted are respectfully invited. Anonymous communications will not be regarded. No name will be published except with writer's consent. The Editors are not responsible for the views of correspondents.

ADVERTISEMENTS.

Only advertisements of an approved character inserted. Inside pages, nonpareil type, 25 cents per line. Special rates for three, six and twelve months. Reading notices $1.00 per line. Eight words to the line, twelve lines to one inch. Advertisements should be sent in by the Saturday previous to issue in which they are to be inserted.

Transient advertisements must invariably be accompanied by the money or they will not be inserted.

SUBSCRIPTIONS

May begin at any time. Subscription price, $4 per year; $2 for six months; to a club of three annual subscribers, three copies for $10; five copies for $16. Remit by registered letter, money-order, or draft, payable to the Forest and Stream Publishing Company. The paper may be obtained of newsdealers throughout the United States, Canadas and Great Britain. Newsdealers in the United Kingdom may order through Davies & Co., No. 1 Finch Lane, Cornhill, London. General subscription agents for Great Britain, Messrs. Sampson Low, Marston, Searles and Rivington, 188 Fleet street, London, Eng. Foreign subscription price, $5 per year; $2.50 for six months.

Address all communications.

ANSWERS TO CORRESPONDENTS.

THE INDIANS AND THE WAR DEPARTMENT.

IT is reported that the President has determined to recommend a change in the method of purchasing supplies for the Indians, and that he will advise that in future this duty shall be entrusted to the army.

It is to be hoped that this report is true. The manner in which their provisions have been supplied to the Indians has long been known to be disgraceful, and the record of the Government in this respect is a sorry one. Although the misdeeds of contractors and Indian agents have often been exposed, the old-time methods still prevail in very many cases. Out in the Western country it has passed into a proverb that the easiest, surest and quickest way to make money is to get an Indian contract. Does such a contract call for provisions? The persons furnishing them send on rusty pork, damaged flour, and spoiled bacon. For clothing? The cloth is rotten and the workmanship of the poorest kind. For beef? The contractor gathers all the lean Texans, all the big-jawed and otherwise sick steers that he can find and delivers them. Too often all this material is accepted by the complaisant inspector and paid for at prices which would furnish good articles of each kind.

Sometimes, it is true, the Indians became restive under this system, and then the army was called upon and the chase of the hostiles began. Meantime the contractors and their employes had had time to get out of the country, and, regarding the war as none of their business, they pocketed their profits and made arrangements to get another contract.

The story is familiar enough, and it is quite time that the system under which such a state of things was possible should be changed. Among the people of the West, with the exception of those who expect to, or are now making money out of the Indians, the sentiment has long been unanimous that the charge of these tribes should be turned over to the army. We have urged this, and no longer than two weeks ago spoke of it as something which ought to be done. We are glad to think that the administration takes so wise a view of this subject as reported.

There are many reasons why such a change should be made. Obviously the army is most nearly interested in the proper guardianship of the Indians. Most of the Indian wars have been brought about by ill-treatment of some kind, and the Indians would not be ill-treated if in the hands of the army. Fighting Indians is not particularly pleasant work, and there is no glory to be got by chasing a few bucks over the prairie or through the mountains for a week or a month. For this, if for no other reason, the army would treat the Indians well and so avoid such expensive wars as of past years. It is evident, too, that the Government can furnish supplies more cheaply when the purchasing power is lodged in one bureau instead of being in two.

The most important reason, however, for making such a change as the one recommended lies in the fact that the Indians will in this way be better supplied. It is no secret that in the past there has been a vast amount of corruption in the Indian Department, which a change to the army would entirely do away with. Notwithstanding the occasional lapses of which we hear among army men, it is still the fact that the officers of the army are as a rule gentlemen of high standing, and are thus far better able to withstand the temptations which are likely to assail those who have to deal with the Indians than is the average civilian, who may have received his appointment as a reward for political work done for his candidate at the polls, nor would the conduct of officers in charge of Indians be at all influenced by those political considerations which oftentimes have so great weight with the civilian. There will be no cases where an army officer to make a good record with his department will try to manage his agency so economically as to starve the people who have been placed in his charge.

The present movement is a long step in the right direction, and, if carried into effect, will do much to better the condition of the Indians.

THE FOREST AND STREAM'S TRAJECTORY TESTS.

WHILE our expert is busy computing the figures necessary to reach conclusions on our trajectory tests, we can only ask our readers to be patient, assuring them that the returns will be made at the earliest possible moment. To those of our readers who have written that they would defer making contemplated purchases of rifles until after the report of tests, we would say go on and make your purchase; any of the standard and well-established makes of American breechloaders are good enough for any hunter. He must, of course, exercise discretion in his selection. He must not expect a squirrel rifle to knock over a bear; but a rifle from any of the well-known armories, used as the experience of its makers shows it should be used, and where the buyer knows how to load and aim a rifle, there need be no grumbling at the piece. The fixed error of the weapon is so much less than the average probable personal error of the shooter that, until the latter is corrected, there ought to be less complaint at the former.

Of course each make of rifle has its advantages and also its disadvantages, and there is need of great care in picking out a weapon; but when the fault-finding period comes, let the shooter acknowledge that he does not know how to shoot the rifle as well as the rifle knows how to shoot.

A NEW RACING CLASS OF CANOEISTS.

NO similar body of sportsmen here or abroad have taken the high standard regarding racing that has characterized the American Canoe Association. It has from the first encouraged racing as the principal factor in the improvement of boats and rigs and the encouragement of skill in handling; and also as the most interesting feature to outsiders at the meets, and the one most likely to promote interest in the sport. At the same time it has so hedged in the races with such restrictions as prohibit any professionalism, but encourage all present to enter races. Racing for anything but honor and the satisfaction of making a creditable performance, is strictly discountenanced, and the prizes given are of little intrinsic value.

Last week we published a suggestion by Mr. R. W. Gibson, last year chairman of the regatta committee, looking to a still further extension of the same idea. His plan is to establish a class open only to men who have won a certain number of paddling or sailing races, these men to be entitled to carry a distinguishing flag. No member will be allowed to take a prize in a regular Association race, though he may enter and be accorded first place if successful. By this plan the few expert sailors who would take most of the prizes are by degrees removed and the prizes are open to the majority, while the presence of the veterans in the races, working only for the honor of first place, will be an additional incentive to the regular contestants who will not care to be beaten badly, even though they win a prize. The extra class itself offers the highest incentive to the amateur sailor, as the simple flag he will be entitled to fly is in itself a warrant of his skill as a sailor or paddler, and will be valued more than any cup or other trophy. It really increases the number of prizes without the usual objection, that when too numerous the value is lessened. Admission to the class itself would be one of the highest prizes to be raced for; the field of entries in the general races would be a large one, and the mere honor of beating it should content a man, even though no prize went with it, as his reputation would be known to all canoeists; while among the juniors to take first prize would be something, but the honor of beating the seniors would be still greater. No extra labor would accrue to the regatta committee who already have enough to do. A number of extra races would soon be arranged among the first class men only, which would add still further to the attractions of the meet. On the whole, the scheme is an excellent one and we hope to see it accepted by the Association this fall

THE TIME LIMIT IN RACES.

A CASE has lately occurred in one of our local yacht clubs in which, according to the testimony of a number, a race was not sailed within the time limit set forth by the club rules, but was nevertheless decided to have been within the time by the judges' watch. Club members on shore, others on the various boats, and the reporters on the club steamer, all timed the start and the finish and made the time of the first yacht considerably over the time allowed. In spite of this the judges at once announced that the race had been made and declared their time correct. As the matter was widely discussed within a few days after the race, the feeling was general that the official time was not correct and that the officials had, to avoid the trouble and expense of a resail, stretched the limit, a state of affairs that has created a great deal of dissatisfaction among many of the club members. The matter was considered at a club meeting, the regatta committee declined to question in any way the return of the judges, and though one of the latter declined to act, the other two stood by their first decision, and in spite of much opposition the sail was declared a bona fide race and the prizes awarded. As no outside boats were entered it is simply a family quarrel which the club may be left to settle among themselves, but it will interest all yachtsmen who may be inclined at any time to enter the regattas of this club to watch the outcome of the dispute. If a time limit means anything at all it must be observed; if the club can have one race only, or if it is to be decided, race or no race, at the will of a few officials, the sooner the limit is wiped off the books the better for the reputation of the club. Members who enter a race under certain definite stipulations may well object if these are thrown overboard at the will of a few, and contrary to the laws and customs of the club. If for any reason the time limit was exceeded, but it was impracticable or undesirable to order a resail, the matter might, if none of the contestants objected, be referred to a general meeting of the club, as to whether the race should stand, but every man who starts in a race has a right to demand that all the conditions shall be complied with, and any trifling with this right must bring discredit on the club countenancing it.

A CONTRIBUTION TO HISTORY.—The account of elk and deer killing in Wyoming, published elsewhere, is not a record of exhilarating sport. It is a cold blooded story of cold-blooded butchery for winter meat. We give it as a contribution to the history of the extinction of American big game. The meat hunt of the Colorado party has its parallel in a thousand other holocausts of the same character. There is one thing for which the writer of the account deserves credit; he does not attempt to magnify the butchery into sport, he is honest enough to call it by its right name. We print it, not for the pleasure of the reader, simply as an illustration of how and why the game of the West is fading from sight.

PASSADUMKEAG PEDAGOGY.—They are slowly learning some things up in the Maine woods. One lesson is that if deer are killed out of season the privilege must be paid for. Another is that it does not pay to net trout on their spawning beds. Instruction to this effect, in the shape of a fine and costs, has just been given to a Clear Stream poacher by a Passadumkeag justice of the peace, whose pedagogical methods are worthy of all praise.

MORE STARVING INDIANS.

WORD comes to us from the Northwest that the Chippewa Indians about Leech Lake are starving.

To news such as this we ought by this time to be accustomed, and no doubt most people who read the paragraph will dismiss it without a second thought. Others will congratulate themselves on the prospect that the Indian question is in rapid process of solution. Certainly, if the United States Government can kill off by starvation a few thousand Indians every year, a simple and inexpensive method of dealing with the race has been discovered. To those who consider that the Indians have some rights, the present case appears a peculiarly aggravated one. Certain improvements connected with the storage of water are being carried on near the head of the Mississippi River, and these have resulted in the backing up of the water over a large area of country, and the overflow of the wild rice and cranberry fields, from which these Chippewas gather their annual crop of winter food. A white man who had a farm in a river bottom would think he was rather hardly treated if in the course of some public improvement a big dam was erected below him, and his land overflowed so that he could take no crop off it. No doubt he would think that he had a claim for damages against some one. But if he and his family starved during the next winter, it would not help them much if his claim were allowed in the following spring. So it is with these miserable Indians. An effort will, no doubt, be made to secure help for them when Congress assembles; but between now and December there will be many deaths in the Leech Lake country; deaths from starvation; deaths for which we must all of us feel some measure of responsibility.

Just as, two years ago, the Piegans and the Assiniboines starved in Montana, so the Chippewas will this winter starve in Minnesota. These tragedies have been so often enacted before us that we have grown hardened. Our hearts, which would readily enough respond to a call for help from a white settlement in distress, feel no throb of pity for agonies suffered by the red men. They are "only Indians," we say.

To send supplies to a distant Indian reservation takes weeks always; more often it takes months. If help is denied to these Chippewas until the assemblage of Congress, the United States Government will have slaughtered them just as surely as if it had sent troops there and shot them down, men, women and children. Only if food is withheld the order of the killing will be reversed. It will be children, women and men.

In years gone by it would have been vain to hope that any steps would be taken to save these people from death by hunger until authorized by Congress. But the Indian question seems to be comprehended by the present administration better than by those which preceded it. We are thus encouraged to hope that help may at once be sent to these Chippewas. If there is no contingent fund which may be drawn on to furnish them food for the winter, it is surely possible to purchase the supplies now, and trust to Congress to appropriate the fund to pay for them soon after it comes together. The President and the Secretary of the Interior, if they consider the question, cannot fail to see the necessity of prompt action, and they may feel sure that any measures taken for the relief of these Indians will receive the unqualified approval and support of the whole people of the country.

Let them remember that in this case the delay even of a few days may mean suffering and death.

GRIZZLY BEAR AND BUFFALO.

IT is hard to crush out popular delusions. In another column a correspondent quotes "old Californians" and Western hunters as making the statement that the grizzly bear is never found east of the main divide of the Rocky Mountains, and the buffalo never west of it. We have never before heard the buffalo part of this saying, and it is remarkable that any one who has had even a slight experience in the West, should make a statement which is disproved by the universal testimony of Western men.

Old Californians and Western hunters are much like other men in other parts of the country. Some are intelligent and observant, and some the reverse. We have had hunters tell us that a two year old mountain ram was an ibex, an entirely different species from the bighorn (*Ovis montana*), and to this belief they would cling until it was demonstrated to them in the clearest manner that the "ibex" was merely a young mountain sheep.

The range of the buffalo formerly extended far to the westward of the main divide of the Rocky Mountains, and their remains may be found to day scattered over the great central plateau of this region. There seems to be little doubt that in ancient times their wanderings reached the Sierra Nevada Mountains of California, and extended beyond the Blue Mountains of Oregon. This was in the old days when there were buffalo.

The error with regard to the range of the grizzly bear is much more widespread than the one about the buffalo. In fact, it is about as general as the belief that the "blacktail" of the plains and central mountains—the true mule deer—is the real blacktail deer. These two are fairly entitled to be called *pseudodoxia epidemica* of the West. We have frequently defined the bears of temperate North America, but this seems to be one of the things which must be done over and over again.

In North America there are three species of bears—namely, the polar bear (*Ursus maritimus*), the black bear (*U. americanus*), and the grizzly bear (*U. horribilis*). The first of these is never found within the borders of the United States. The second is characterized by short claws upon his front feet, not much if any longer than those on the hind toes. In color he varies from glossy jet black through dark and light brown to pale yellow. He is found throughout North America at large. In shape he may be short or long, stout and roly-poly, or slim and slab-sided. The third species, the grizzly, has long claws upon his front feet, much longer and stouter than those behind. He is larger than the black and occupies the western half of the continent. He may be of almost any color of the rainbow, and for each color there is a local name. In California, and in the mouths of well-informed people generally, he is a grizzly wherever he is found, but in Idaho, Colorado, Wyoming and parts of Montana he is a "cinnamon," a "range bear," a "gray bear" a "silver tip" or a "bald face," according to the ignorance of the man who sees him or his hide. He is, however, just as truly a grizzly as his California brother, and he can be distinguished always by his long fore-claws. Color is absolutely valueless as a specific character in the grizzly and black bears.

A WORD ABOUT EDUCATION.—Occasionally we receive a letter like this: "Having been reared in the backwoods, and consequently not having many literary advantages, I cannot make much pretentions to style of writing. But if you can have patience to reduce my manuscript to a form suitable for publication, I should be glad to contribute freely to your excellent journal." No reader of the FOREST AND STREAM can have failed to observe that many most valuable communications to its columns have come from men who have not had "literary advantages," but have had peculiar opportunities to learn the lore of the woods and the ways of nature. We always welcome such communications—written because their authors have something to say. We never judge a correspondent by his handwriting, spelling, nor grammar, but only by the interest of what he has to tell us.

The Sportsman Tourist.

THE BULL FIGHT.

OUT from the city whose humane decrees
Forbid the sport, the crowds in happy mood
Stream toward the bull pen raised at Huizachal.
A pleasant ride, and not too long, for those
Who drew the lines that shut the bull fight out,
Wisely conceding to the popular heart
A ready way to gratify its loves,
Kept their hard limits just outside the gates
Of the old amphitheatre whose sands
Had reeked for years with bloody sacrifice.

It may be that Italian skies are blue
With tints as deep as ocean's soundless flood;
And Colorado lifts its pine-clad hills
In endless swells of heaven-reaching peaks,
Through air that thrills like pleasure's first full draught.
But oh! the ridged Sierra's mounting waves,
Rising enormous, cloudy range on range,
Whose notched and wrinkled mountains seem as smooth
As crumpled velvet through the softening haze;
The wide green plain hedged off with stiff maguey;
The half mirage that hides the shallow lakes,
Yet points to where they lie; the clumps of trees,
Waving strange foliage in the gentle wind;
The arching line of the long aqueduct!
Southward, above the giant cedars' fringe,
Gleams the white castle of Chapultepec;
Beyond again the brooding city lies,
Its thousand towers half seen through hovering smoke;
And farther still, floating in misty blue,
Glitter the twin volcanoes' silver domes.

Favored of God, the vale of Mexico
Has been the prize each new invader grasped,
From the poor Austrian whom France betrayed,
Back to remotest history's faintest tale
And eldest dream of legendary time.

Toltec and Aztec glide from cloud land back.
Again stern Cortez cleaves his fiery way.
Wrong and rebellion follow. Then at length
The Great Republic sends its fearless sons
To sweep in conquest from the distant gulf
And crush together all the wrangling bands.
Where is the peace that should have come with Christ?
Who tells the triumph of good will to men?

The Indian's savage war god drank for years
The blood of murdered victims; after him,
On the same marsh where his clay temple stood,
Rose the cathedral built by Christian hands,
And prayers went up, and holy words were read,
But the unpitying Spaniard's cruel greed
Kept up the barbarous idol's hecatombs.

'Tis Sunday now, and somewhere in the North,
Where curving earth catches no tropic ray,
Good men are telling to their listening flocks
The praise of meek, sincere self-sacrifice,
And great rewards in happier worlds to come.
Here on the glistening fortress' lofty walls
The black-mouthed cannon yawn in grim array.
Hark! The apostle of a different creed
Thunders his gospel from another mount,
And from that iron throat and tongue of flame
Come arguments that leave no room for doubt,
But, falling in destruction's graceful curve,
Compel consent. Almost with one swift glance
You see where Churubusco's ramparts tried
To hold the impatient Northmen back in vain,
Where eager stormers climbed Molino's walls
And the forlorn hope rushed on Chapultepec.

Not far from sight the now unbroken street
Still bears the name of Alvarado's leap,
And a time-shattered tree recalls the night
When the foiled conquerors in wild dismay
Fell back before the Indians' fierce despair.

Following the clew of labyrinthine thought
Through paths that endlessly go branching on,
I find myself, like Theseus, face to face
With the horned monster. Opens wide in front
The portal of the ring, and, stepping fast,
Already pricked by the sharp barbed rosette
Upon his shoulder, eager for the fight,
The tyrant of the hills comes proudly on.

Some say that in our modern sapless days
The spirit of sham mines even our brutal sports;
That bruising fighters now have lost the thirst
For victor glory, and the quarrel lies
Only as to who shall rob the public most.
This may be true in our commercial States,
Where smartness is the idol of the mob
Even more than bodily strength, but here at least
No mild domestic animal was loosed
For lazy picadors to prod with poles.
Fierce and untameable as grizzly bears
The destined victims faced their clustering foes,
And every man that fought the savage beasts
Played for his life with smiling cheerfulness.

A lean gray horse guarded with leathern shields
Carried the picador, whose buttoned spear,
Firm in the neck or shoulder of the bull,
Parried and lifted off his first attacks.
Pain adds to anger and soon boring in,
Careless of the sharp lance that bars the way,
The frothing creature rips the leather off,
And gores the breast of the poor patient horse.
Then gushing blood flows down the trembling legs,
But the insatiate bull keeps lunging on,
Lifting and lifting till the struggling limbs
Hang limp, and with a mighty surging push
Backward upon his rider falls the horse,
While still the furious bull goes charging on.
In rush the fighters with their purple cloaks,
And the bewildered savage leaves his prey,
To lose his strength in profitless careers,
Chasing his lithe tormentors all in vain.
If he but levelled his now dripping horns
And blindly dashed amid the scattering crowd
Revenge were his, but ever when he comes
Where flashed the red that caught his blood-shot eye
He heaves his head into the empty air,
Or finds but yielding cloth; and, tossing high
His horns and shoulders raised in angry prance,
Stops in his course to seek another foe.
Wearied with fruitless efforts then the bull
Turns slowly round, and scanning the great crowd
Piled in the sunshine, where serapes gay
And glittering bullion flash, and where the shouts
Rise with the clangor of the hoarse-voiced sea,
He clears the palings with a mighty bound,
Yet hangs half caught on the strong, tense-stretched rope
Till freed and driven harmless back again.
Now to refresh the victim's waning powers,
They bring the banderillas, whose sharp goads
Spur all the fury of the flagging brute.
As when a shrunken river, straining slow,
Dwindling in its long course beneath the sun
That dries its level channels, meets a stream
Filled high from deep, cool ponds and icy brooks
That drain the heart of forest-guarded slopes,
Swelled with the tribute waters moves along,
Sparkling and foaming with the joyous pride
Of freshened power, so his courage rose.
Many the feats of daring and of skill
Done by the wielders of those gaudy darts,
Which now hang trailing plumes and streamers down
Along dun flanks spotted with dust and blood,
Till at the last the people are content
And call the espada for the final act.

Careful he stands spreading his scarlet flag
On the stretched point of his red-hilted sword,
And swerving always from the lumbering charge
Till chance be given for the fatal blow.
Even then for once he fails—the ill-aimed blade
Slips on the shoulder, glancing on the bone,
Comes bent and bloody from the ragged wound
That serves but to enrage; and now at length
With better nerve he points the mortal steel
Right where the crested withers leave the neck,
And leaning forward drives the weapon in
Up to the quivering hilt. The startled bull
Gives back surprised a moment. Then he starts,
Reeling and staggering, with protruding tongue
And staring eyes, like a great ship misstayed
In heavy seas; rolling at last convulsed,
Till stiffened by the poniard's mercy stroke.

Then come the mules to drag away the slain,
And the loud band begins a triumph peal,
While the round walls, doubling the joyful sound,
Toss back with wanton grace the gay accord.
Somehow, I know not why, when in my ears
Vibrate the strains of stirring harmony,
I lose the music, and on fancy's wings
I roam through realms brighter than earth e'er knew,
Or joy in memories of the happy past.

So now, the bugles strike their swelling notes,
And at the sound, as by enchanter's charm,
From my rapt senses fades the busy scene.

Gone is the bull ring. Gone the shouting crowd.
Through cedar shades that wrap the castled steep,
Over the hot turmoil where purple cloaks
And whirling dust and flying fighters mask
The rush and terror of the fierce advance,
Float forms that claim no blood from old Castile
Nor boast descent from Aztec emperors.
And clear amid the blare of rhythmic brass
Soft voices whisper low and precious words
That echoed once in my far northern home.

H. G. DULOG.

BLEATING FOR DEER.

I HAVE killed two deer to date. Deer are very plentiful, but it requires some knowledge of the Indian mode of hunting before one can be successful in shooting them. I had a number of unsuccessful long-range shots at them before we went to Kash-an Bay. There we took on board a Haidah Indian as hunter and guide. The first time he went out I accompanied him to get his style. He halts at the edges of the clear spots, which are quite frequent in the timber. These places have no undergrowth, though there may be trees and there are usually pools of water scattered about, and the grass is green and plentiful. There he conceals himself and uses the deer-call, which is two bits of wood, slightly concave on their approximate faces, and in the space thus made there is secured a thin ribbon of the inner bark of the cedar tree. If you have ever made music with a blade of grass between the two thumbs brought together you will have a clear idea of a deer-call, held horizontally.

Well, this day he took me a fearful tramp up and over mountains, where he said the largest deer were to be found at this season. Finally we halted at the edge of a space nearly at the summit of one of the mountains, and we had not been there long when a deer, in response to the call, came rushing out of the underbrush at the side into the midst of the opening. The Indian got in the first shot and missed, but as we were well concealed and did not move, the deer stood his ground, only moving around partially, startled by the noise. I then put in my shot, but he bounded away as if a pack of hounds were after him. The Indian was so disgusted at his bad luck that he said the deer was not hit, and he sat still blowing his call. His gun is a miserable affair, but mine I knew was good and would shoot straight if held straight, and I did not believe it possible that I would miss such a deliberate shot. After sitting still a few moments I concluded to go and see if there were traces of blood about. Sure enough drops of blood were very evident, and we followed up the trail without much difficulty and found the deer lying dead about 300 yards away, shot through the lungs. It was a magnificent doe, fat, and weighing about 150 pounds. As the Indian had to pack it down to the beach, this was the end of our hunting that day. I was sure I never could get one out of the timber without cutting it up and bringing it out by piecemeal.

On Saturday we went out again, another officer and myself, with the Siwash Indian. We saw a number of deer, and we all got a shot around and missed. The Siwash got a second chance and killed. The day was misty and raining, and we jumped most of the deer from their forms. We saw five in all. The first got away without being fired at. A short distance off a second got up and my mess mate fired a point blank shot at it standing, and scored a clean miss. As I ran around to get a shot at the same one two came into a clearing. They did not seem to be in a hurry. They were not running, but walking, and I was not more than seventy-five yards away. I shot and knew at the time that I had not good aim, but I was flurried with running and with fear that they would get away before I could shoot. It is needless to say that I missed. About 10:30 the Siwash got his second shot and killed a doe, and we returned to the ship at 1:30. Two days after I went out again with another mess mate without the Indian. We were paddling along in a canoe when we saw a deer on the beach. They come down to the beach at low tide to get salt. We pulled in for him, but he ran off the beach before we were near enough to shoot. Deer in this country are so little hunted that they are not very timid. They don't fear danger from the water and are not usually frightened at the sight of a canoe, if it is to the leeward of them. This fellow walked the whole length of the beach parallel to the water and stopped occasionally to look around. As soon as he disappeared in the timber I landed above him and ran back from the water several hundred yards until I found a clearing. Here I concealed myself and began calling. It was not long before I heard a rushing through the bushes, and then everything was still. To save my eyes I could not see the deer. I knew he was close by, but I continued calling and searched the bushes on all sides. Presently I again heard a rustling, and turning my eyes to the left I saw him in the bushes about thirty yards off, standing stock still shaking the deer flies from his head. He had circled half way round me; I had expected him from the other side. It did not take long to draw the bead, and I knew I had him by the way he bounded off, wobbling from side to side. I went to the spot and took up the trail of blood and followed it a few hundred yards to where the deer was lying down, shot through the back part of the abdomen. It was a spiked horn buck, in velvet, in good condition, and he won me the reward offered for the first deer killed by one of our mess and brought aboard ship. This reward—of five dollars—was posted on our way round from New York by one of the officers who had made a cruise in Alaska and who does not have much faith in the hunting skill of the average naval officer. I had not claimed the reward on the other deer I killed because there were two shots fired at it and I did not wish that there should be any doubt in his mind when paying it, and I knew it to be only a question of time.

Our experience has corrected a great many wrong impressions about this country, which we got second-handed. First the impenetrable character of the country and the Indian mode of hunting. We were told that it was impossible to get back far from the waterways and that the Indians stationed themselves at the end of a deer trail where it comes down to the water and waits there until the deer comes if it takes a week. They tell a story of an Englishman who came up here to hunt. He hired an Indian to go with him. He was stationed on a trail and told to keep quiet. He soon got cold and wanted to build a fire, but the Indian said, "No, scare deer." Then he wanted to smoke. Siwash said, "No, scare deer." After a while he asked when the deer was coming. Indian said, "Maybe to-day, maybe to-morrow; no come to-morrow, come next week."

Now, this officer on our ship had faith that no white man would have patience to hunt in this fashion, and he was right; but he has lost his five dollars.

The Indian hunts with a deer-call.

There is another story which I have heard as frequently repeated, this is, that Alaskan trout will not rise to an artificial fly. Only in the last batch of FOREST AND STREAMS which you sent me did I read an article about trout fishing near Fort Wrangel, signed "Reel-Plate," in which he reiterates the old navy tradition. Now I have fished with nothing but artificial flies since I have been here, and my score to date—from June 3 to July 9—is 134. In this time I have been out but eight times, and it is remarked by every fisher on board that I have more rises than the bait-fishers. I give you my score for one day, and it was not my best either in point of numbers; but it was the only time that I weighed them: Total, 19, weighing 11 pounds. Of these eight weighed 7 pounds, one weighed 1 pound 10 ounces and another 1 pound 8½ ounces. I know no more exhilarating sport than fighting a two-pound trout on the end of your line and playing him skillfully until he is exhausted. You are obliged to do this because you cannot land him with your light rod until he is played out. I have had them sulk on the bottom so that all the strain I could put on my rod without breaking it would not move them, until I would think my hooks were foul on the bottom. Then to see them dart off, carrying out nearly all the line on the reel, shooting the rapids, leaping high out of the water in their struggles to escape, is exhilarating enough. When you have landed one of these fellows you feel very proud.

I am well pleased with the performance of my rifle. It is a .45-caliber and shoots 70 grains of powder and 405 grains of bullet. I have enough confidence in it to face even a grizzly bear. I have had very little use for a shotgun, as it is not the season for ducks and geese; but I hope to put in some good work with it later in the season. I have had some grouse shooting, and in every instance have used my rifle. The caliber is too large for these, especially if one wants the bird for the table afterward. I will add that all of my birds have been in good condition for the table after shooting. There are several kinds of grouse found here, but I have killed only the spruce or Canada and the sooty grouse. The latter is as large as a year-old hen, or what we call a spring pullet. It is good sport shooting these with a rifle. They sit in the tall spruce trees and make a booming noise which can be heard at a long distance. But it is not so easy to see the bird as it is to follow up their call. I have walked around a spot where I knew there was a grouse for a half an hour, and the bird was booming all the time, before I could locate it. They are gifted with ventriloquism, it is said. They sit on the larger limbs close to the body of the tree, and are very difficult to discover. I hope to go on a bear hunt as soon as we return to Kash-an village, and I may get a chance at a mountain goat when we get to working along the mainland. They are never found on the islands off the mainland.

Another tradition about this country is that, although it rains or is cloudy three hundred days out of the year, yet clothes dry quickly under an awning and things never mildew. I cannot say how true this is, but in our experience there has been plenty of sunshine and there has been no need of awnings to dry clothes. It has been so dry that forest fires have been common; but then the oldest inhabitant comes along and tells us that we are having an exceptional season.

Natural History.

RANGE OF THE GRIZZLY.

Editor Forest and Stream:

I have not seen Mr. Roosevelt's article, "Still-Hunting the Grizzly," and don't wish to enter into the discussion of the petty points raised by some of your correspondents; but I would like to ask one question of your bear editor while the subject is up. Is the true grizzly of the Sierras and mountains further west ever found east of the main divide of the Rockies, or even as far east as Idaho? Old California hunters whom I have met this summer declare not. With them it is a saying that the buffalo is never found west of the divide and the grizzly never on the eastern side. I have not been hunting myself, but an extended trip through Western and Central Montana has thrown me in contact with some of the oldest and best hunters in the Territory. I have seen bear skins by the bale at Fort Benton, and have heard the matter discussed scores of times by men who have traded for years with the Indians and "breeds," but have as yet discovered no trace of the true grizzly in Montana.

The silver-tip, brown or cinnamon, and the smaller black bear are all here, the first named being the most common, and from what I can learn probably the animal that fell to Mr. Roosevelt's gun on his still-hunt. They grow to a great size as compared with the black bear of our northern woods, sometimes, when in good condition, running up to 1,200 pounds, and are often savage and dangerous to attack, even when they have a chance to run, but if we can accept the current stories of the live grizzly's disposition, their comparative ferocity would be about as between a bob cat and a tiger.

Mr. R.'s article has called forth some criticism from old-timers, but nothing in comparison with the remarks indulged in when Wm. A. Baillie-Grohman and his mountain goat are led into the ring.

The goat is plentiful in the Bitter Root Mountains, owing to the fact that his pelt is too coarse for the furrier and his hide is not considered valuable by consumers of deer and antelope skins. In other words, he has no market value as yet and so holds his own in plain sight of the thickly settled valley extending from Missoula to the headwaters of the Bitter Root. At all times keeping near the snow line, his capture in summer entails a hard climb, but later in the year the hunt is attended with no particlar hardships or uncertainty as to result.

The confessions of a buffalo butcher in your issue of July 16 show up the hide hunter in one of his mildest forms. Up to within three or four years ago the true professional worked differently. A couple in partnership would hire five or six laborers to skin, go on to the range in summer, make a permanent camp, put up hay for their horses and await the coming bands. Hundreds of carcasses piled in a small area show where they succeeded in getting a band to stand. Riding around them continuously kept them "milling" in a densely packed mass, while the slaughter went on until all were down or a break was made. When this occurred, a chase of a few miles enabled them to round up again and thus whole bands were wiped out. The suddenness of their extinction is something surprising, even when we take their treatment into consideration. In 1883 one firm of post traders on the Missouri handled over 6,000 hides, the next year not one.

The fertile, thickly grassed plains of Central Montana were undoubtedly their favorite feeding ranges, for you find their remains here, scattered almost as thickly as in Wyoming you meet with the bones of starved beef steers.

T. M. W.

UBET, Mont., Oct. 28.

[The old-timer who says that the grizzly is never found east of the main divide of the Rocky Mountains, and that the buffalo is never found west of it, is neither more nor less than a particularly ignorant man. There is little use in talking with such an one.

ABOUT SPONGES.

WHAT we are familiar with as the sponge of ordinary use is, of course, only the skeleton of the animal. This skeleton, as any one may see from an examination, is made up of a great number of fibres interlaced and interwoven together, but leaving very many holes and canals between their bundles. Some of these holes are quite large, but the great majority of them are exceedingly minute. It is these smaller holes which retain the water when a dry sponge has been dipped into it. We shall see presently that in the living sponge the smaller and larger apertures have precisely opposite functions.

Now, when the living sponge is taken out of the water, its skeleton is covered all over, inside and outside, with a soft jelly-like matter, much like white of egg to look at. This constitutes what may be called the sponge flesh. A bit of it placed under the microscope is seen to be made up of distinct cells, and further examination will show that while the flesh appears to cover the skeleton in a single layer it really consists of three layers. These we will call the inner, middle and outer layers. Each layer is made up of cells of its own kind, and each has a distinct function to perform in the life of the animal. The work of the inner layer is to secrete the skeleton. The work of the outer layer is to procure food for the animal. The middle layer is concerned in the reproduction of the species.

Let us now consider a little more in detail what the function of each of these layers is and how it is performed; we shall then have a good idea, not only of how the sponge is made, but also of how it lives. Beginning with the outer layer, let us see how it accomplishes what is mainly its part, the procurement of food. The aid of the microscope is required to determine this. For it is only by the use of this instrument that it can be seen that many of the cells of the outer layer are provided with short vibrating hairs or cilia, which project out into the canals by which the sponge-mass is everywhere pierced. Now these hairs are constantly lashing to and fro, and as they move in one direction (say forward) more rapidly than in the opposite direction (backward) it is readily seen that the effect of their motion is to cause currents of water to flow through the canals. We have now only to observe that these ciliated cells line only the smaller of the pores of the sponge-mass to understand why it is that in the living sponge currents of water are all the while passing out of the large openings and into the small ones. No mechanism is required to cause the water to flow out of the sponge-mass; the cilia which line the small pores causing the inward current, the outward current takes care of itself.

It used to be a great puzzle to naturalists to tell what caused the currents of water to flow in and out of a sponge. The discovery of the ciliated cells solved the riddle.

A living sponge, then, has all the while currents of water flowing through and through it. It is in this way that the sponge gets its food, for the currents are laden with small food particles, and as these flow along past the cells of the outer layer the latter appropriate them to themselves as food. Think of each cell as a minute lump of jelly, and the food particle as being received into it (probably by the action of the cilium) in the same way as a marble may be thrust into a ball of clay, and you have an idea of the way in which the sponge cells take in their food. The food having thus been received into the substance of the cells, it undergoes digestion and assimilation—that is to say, it is built up into the living tissue of the cells. Should any part of a food particle be composed of indigestible matter it is discharged from the cell into the passing current, and so finds its way to the outside of the sponge. A due portion of the food matter taken up by the outer layer of cells finds its way (probably by a process of absorption) to the cells of the middle and inner layers. A part of that which reaches the inner layer goes to build up the tissue of its cells, while another part furnishes the material out of which the skeleton is made.

This brings us to a consideration of the work of the inner layer of cells. Their office, as stated above, is to manufacture the skeleton. The skeleton of the ordinary sponges is composed of a material closely allied to horn in its chemical composition. Now, these cells have the power of transforming the food matter of the sponge into this horny material. This is done by a process of vital chemistry called secretion. It is in the same way, of course, that coral is made by the coral polyp.

It remains to consider the function of the middle layer of cells, viz., the reproduction of the species. At the proper season of the year (toward the approach of winter in the fresh-water sponge) both the male and female elements—sperm-cells and ova—are developed in this layer. The ova undergo fertilization and partial development before leaving the sponge. When first set free the young sponge is a small ciliated organism capable of swimming about freely in the water. Thus for a time it enjoys an independent and locomotive existence, and it is in this way that sponges are distributed over wide areas. After a time they attach themselves at the bottom of the sea and are henceforth fixed animals. I have never seen any explanation of the different forms sponges assume in their growth. Some are decidedly plant-like in appearance, consisting of a central stem or axis from which branches are given off in symmetrical arrangement. Others acquire the form of a hollow cylinder, and still others are cup-shaped; the latter are often called basket sponges. Many grow according to no definite pattern; in other words, are amorphous.

Not all sponges secrete the kind of skeleton which forms the sponge of common use. There are, in fact, three classes of sponges, the classification being based on the nature of their skeletons. First, there are the horny sponges, being those of common use; second, the calcareous sponges or those whose skeletons are composed of lime, and third, the siliceous sponges, or those having skeletons of a flinty nature. Sometimes there are two kinds of material in the skeleton of the same sponge. In some of the coarser horny skeletons of common use, grains and lumps of limy matter are often present. A very beautiful example of the siliceous sponges is the Venus flower basket, which has been described as resembling a goblet of spun glass. They are found near the East India Islands, and are said to live anchored in the mud at the depth of about ten fathoms. Most of the sponges of commerce are obtained from the Mediterranean Sea. Many are also imported from the West India Islands, but are of inferior quality, being coarser. Soft, brittle sponges of no commercial value abound everywhere on the sea-shore attached to stones, shells, etc., between and below tide marks I have seen large quantities of them taken up by a dredge at a distance of a mile or so from shore. When taken out of the water they have a peculiarly disagreeable ordor. All sponges are marine except one, the spongilla. This occurs in nearly all parts of the world, in streams and ponds, attached to stones, sticks, etc. Sometimes it grows in sewer

pipes, and there is one instance, at least (in Baltimore a few years ago), in which it grew in this situation in sufficient quantities to make necessary its removal.

Those who gather sponges go out in small boats provided with a water glass and grappling hooks. The water glass is simply a hollow tube having a plate of window glass set in one end. Its use is to enable the men to see clearly objects at the bottom of the sea. By simply placing the closed end a little below the surface of the water and looking through the other end, the disturbing effects of the waves are avoided. The grappling hooks, or grapnels, consist simply of long poles, in the ends of which long hooks are fixed. They are used to tear the sponges loose from the bottom and bring them to the surface. After a sufficient quantity has been collected they are thrown into an inclosed space of shallow water near the shore and left to die. After having lain a few days the men go in and tread upon them with bare feet until the dead flesh has been squeezed out. They are then taken up, thoroughly bleached by acid, and sent away to market.

For a long time sponges were thought to be plants. It will, therefore, be interesting to consider for a moment the characters by the discovery of which they were relegated to a place among the animals. In the first place, it may be remarked that whatever resemblance they may bear to plants are only superficial. Some of the branched forms are plant-like in shape, and all, in being attached permanently in one place, are like the great majority of plants and unlike the great majority of animals. However, there are some plants which have the power of locomotion, and there are many species of animals besides the sponges that are fixed; and so there is nothing anomalous in the sponge-animal in possessing these two characters. It is when we consider the more fundamental characters of the nature of their food and the chemical composition of their body substance, that we discover their affinities to be with animals. Sponges require organic matter for their food. Plants, as is well known, live upon inorganic substances, such as water, carbonic acid and ammonia. In the matter of chemical composition sponges contain the most characteristic element of animal tissues, viz., nitrogen; and they lack the most characteristic vegetable compound, viz., cellulose. -S.

Manatee in New York.—A live manatee was on exhibition for two or three days last week at Mr. Blackford's place in Fulton Market. It was brought from the Amazon River by the captain of the ship Lisboneuse, and reached here Oct. 24. When it arrived it was in good condition and seemed to greatly relish its diet of lettuce and celery, but owing to its unexpected arrival no provision was made for heating the water in its tank, and it died on Monday last, Oct. 26. Its carcass was sent to Mr. Burt G. Wilder, the anatomist, for dissection. It is a great pity that, owing to the lack of facilities of those having the animal in charge, the temperature of the water was allowed to fall so low. Sunday night was quite cold and the mercury fell to about 32°. The manatee was not protected in any way and could not survive the chill.

Game Bag and Gun.

RANGE OF THE WHITE GOAT.

Editor Forest and Stream:

Having been "in at the death" of three mountain goats, I will furnish, if you are not weary of the subject, the tale thereof. These were killed Aug. 22. 1883, on the borders of Lake Chelan, Washington Territory. Lake Chelan is an expansion of Stahaken River, and is a fissure lake, that is it occupies a rift in the lava and granite, which extends from the summit to base of the Cascade Mountains, and for nearly seventy miles transversely through them. It is walled in many places by almost perpendicular cliffs of basalt and granite 2,500 to 3,000 feet high. Here and there the wall is broken into precipitous slopes, scantily timbered and tufted with grass and chapparal. The foot of the lake is 250 feet above the Columbia and about two miles distant from the river. The altitude of the Columbia at the mouth of Chelan River is 524 feet, so the lake is 774 feet above the sea. A large clay deposit now twenty to twenty-five feet in height at the foot of the lake shows incontestably that the water has stood at a much higher level, this, too, since the occupation of the Indians, as rock paintings at the head of the lake now far above water line attest. The convulsions of nature which tore away so much of the barrier and loosed the pent up waters must have been tremendous.

The mountains which border it are snow-capped. Good harbors, where even a small boat or canoe can find refuge during the storms which often sweep over the lake, are infrequent. Grander scenery cannot be found on this continent. Cascades leap from untold heights. Cañons reverberate with the roar of their mountain torrents, while the narrow valleys are filled with the music of babbling brooks, the hum of insect life and the rush of the startled grouse. The timber frequently shows signs of bear. Poplar and fir are lacerated for seven to eight feet from the ground by the claws of some monster. On seeing them the Indians would shake their heads and say, "Hy-a's maserche Itsook." At an altitude of 6,850 feet, near the head of the lake, hoary marmots ("sewelel" of Columbia River Indians) and white weasels were abundant. The former is a very interestsng animal. Its clear whistle re-echoing among the rocks at that altitude seems uncanny, as if the dwarfs of the mountain were calling. Black-tailed deer frequented the lake and lakelets on the mountain's side. Grouse—blue, ruffed and Canada—were plenty. Fine trout are found everywhere in the lake, but best at mouths of streams.

While sailing up the lake we saw seven goats in one bunch and several others singly or in pairs. One was shot at on the very border of the lake. Three were killed a few hundred yards up the mountain, not more than 500 (1,500 feet), so their range was from 800 to 2,300 feet above tide water, and very far below snow or timber line. I send you a bit of the skin of one of our quarry. The horns of the male, which I now have, measure just seven inches. None of our goats were as large as those reported by Mr. Baillie-Grohman.

The Rocky Mountain sheep, according to the Indians, is not found here, but large flocks exist further north, near the boundary. I have a horn from Lake Osooyoos. The sheep was killed about twelve miles west of that. Our specimens of goats did not have their winter coats, so there is a lack of wool. We found the meat excellent, better than full-grown venison. T. E. W.

HUNTING FOR MEAT.

On Oct. 23, 1883, myself and my son, a boy of 12, left our home in Colorado for a four weeks' hunt in Wyoming, to secure our winter's meat for my family. Our outfit consisted of a team, saddle horse, 9x10 wall tent, supply of warm bedding, emigrant stove made of sheet-iron and supply of provisions, such as flour, lard, potatoes, sugar, coffee, molasses, etc., with few cooking utensils, tin plates and cups, stowed in a large mess-box.

Our road to Laramie Plains passed through the Front Range of the Rocky Mountains. At Dale Creek Ranch we saw a large mountain lion that the ranchman had shot the previous night through a window while the beast was trying to purloin a pair of antelope saddles hanging at the end of the log house. Crossing Laramie Plains, between Laramie City and Laramie River, we became lost in a snowstorm, and after driving some time after dark we came to an old sheep corrall, in which was a large stack of hay. Here we camped for the night, giving our horses a good supply of hay from the stack, but we could find no water, so we had to make what is called in the West a dry camp. The following day was cold and windy, but we succeeded in finding water, and having come upon our road again reached the river at sundown, where we made camp on a nice grassy bottom, with but little snow on the ground. A cowboy came to our camp just at dark, riding one horse and leading another, and desired to camp with us for the night, as it was too late for him to make the next ranch. We gladly offered him hospitality, and the evening was passed very pleasantly in conversation around our camp-fire.

When about 175 miles from home we came to a large cattle ranch, known as the "49 Ranch," and owned by the Scotch Company, of Edinburgh, Scotland. Here we fell in company with three Scotchmen who were going on a hunt to Bates's Hole, some fifty miles west of the "49 Ranch." There was no road from here to the Hole except the "round-up" road, which we followed until after crossing the Little Medicine River a few miles, at which point we left the road and followed a dim trail made by hunting parties. All along the road from the "49 Ranch" antelope had been continually in sight in large bands, like flocks of sheep, but most of them kept at a good distance from our wagons and out of range of our rifles. After two days' drive from "49 Ranch" we went into camp in a deep valley on Bates Creek. Here we found the snow all gone and fine grass and water for our horses. If one horse is picketed out with a long lariat rope and an iron picket pin, the other horses will remain near by. Wood was also abundant, and we were soon settled in a comfortable hunter's camp. On the night of our arrival here we found another party preparing to start for home with their loads of game, of which they had a fine lot of both elk and deer. The deer of this section are of the blacktail and mule-deer species, somewhat larger than the deer of the Eastern States, while the elk is almost as large as a cow, weighing when dressed from 300 to 500 pounds. They roam over the hills and plains in countless herds, it being no uncommon thing to find a band of from 500 to 1,000 elk quietly feeding like so many cattle.

The next day after going into camp on Bates Creek the three Scotchmen and myself struck out over the hills for a day's hunt, and left my son, Elzy, in camp to look after the horses and secure a good supply of camp wood and get everything in good fix about camp. Shortly after leaving camp we divided our party. Billy and I struck off to the left, while Mack and Jack kept to the right up over a high pine ridge. Billy and I kept on over the hills until we came down on the creek bottom again, where we found a lot of elk skins hanging up high in some cottonwood trees, evidently left there a year or so before by hunters who had not been able to pack them out and had hung them up for safe-keeping until their return. Then we bore off to our right and came out on a mountain side covered with snow, and, being tired from our long tramp over the hills, we here sat down to rest and take a view of the beautiful picture spread out before us of hills, valleys, pine ridges and huge rocks of immense proportions and all forms. After ten or fifteen minutes we suddenly discovered some three hundred elk feeding among the rocks in the glade, a quarter of a mile below us. As we were sitting within full view of them, a little skulking was necessary for us to get back over the ridge out of their sight, and just as we had accomplished this we discovered another band of about the same size coming out of the pines upon the opposite ridge, followed by Mack and Jack. They, being inexperienced hunters, did not follow the elk with as much caution as they should, but came dashing down the mountain side in full view of the game, and soon had the entire band, which now numbered about six hundred, on a trot down the glade, and at the same time began to fire at them at long range. Billy and I, seeing that the elk were making down the glade and would be likely to cross over the lower end of the ridge we were on, hurried off a run as fast as we could toward the lower end of the ridge, which we reached after a hard run of about one and a half miles, and were just in time to meet the elk as they were about to pass over the point. I was some distance ahead and to the left of Billy, and as the elk saw me those in front stopped, while those behind came crowding up so as to make a "pack" of the herd. I instantly drew sig.t on a fine heifer and fired. The herd turned and ran. The one I had fired at made a few jumps and fell, and another one soon went down, and I found on examination that my ball had passed through the shoulders of the first one and into the body of another one standing directly in range. In the meantime Billy and I had fired several shots at the herd as they ran, and Billy succeeded in bringing a fine one down with a broken back. We now made all haste to dress our dead elk, which done, we filled them full of clean snow. We then hastened on after the herd, which had turned to our left and crossed over another ridge and across a large flat before going down into the Hole. Mack and Jack had intercepted them on this flat and killed one fine heifer, which we soon helped them dress, and we then all followed the trail to the edge of the Hole, where we discovered the band of elk feeding on a bench or flat about one mile distant.

It was now 4 o'clock in the afternoon, but Billy and I at once decided to give them another chase before dark, so we struck off to the right to try and get in ahead of them, while Mack and Jack remained on a high ridge near by to see the fun of the chase and then to return to camp, as it was now some distance off. After a hard trip of slipping and sliding, we reached the bottom of the ridge and placing another ridge between us and the elk, we hastened on as fast as we could for some distance and then crawled to the top of the ridge to reconnoiter a little, but found that the game was still some distance ahead of us. We crawled back again and hurried on, when we again approached the top of the divide. After looking for some time as we lay flat on the top of the ridge, we discovered a large bull elk and a bunch of heifers a short distance to our right, quietly looking at us and trying to make out what sort of animals we were. I whispered to Billy to lie still and I would slip back and try and get in ahead of them and at the same time he should follow up the band but keep out of their sight as much as possible. I soon succeeded in getting in advance of the band by taking a circuitous route; and placing myself behind a large rock I waited for their approach. As soon as they came within seventy-five yards I opened fire on them and did not cease firing until I had exhausted all the cartridges in my magazine. One large bull elk I had fired three shots at, for I desired very much to secure his head as a prize, his antlers being very fine and large. By this time they came in range of Billy's gun, and he opened fire on them, but being at long range he only succeeded in killing one. On going out from behind my rock I found that I had killed three fine ones, two heifers and one spike buck; and that the big bull I had fired the three shots at was badly wounded through the back and was slowly going down the gulch toward the creek in company with a fine heifer that had one hind leg broken up close to the hip. I fired one shot at the bull but missed him, being down hill. I then discovered that I had but one shot remaining in my gun and my belt was empty. I called to Billy to "Shoot the two elk going down the gulch," but he replied that "he had no cartridges." So I gave him my gun with the one remaining shot in it, and told him to follow the bull down to the creek bottom and kill him and I would try and catch the wounded heifer. I soon succeeded in overtaking her and with one vigorous shove pushed her into a washout about eight feet wide and some four feet deep, thinking this would impede her progress so I could kill her with my hatchet, but she could make about as good speed here as before, so I sprang in on her back and had my first ride on the back of a wild elk. I now drew my hatchet from my belt, and getting a good hold in the long hair on her neck I reached forward and struck her several hard blows between the ears and eyes, which soon brought her down. I then whipped out my hunting knife and cut her throat. At this instant I heard Billy fire, and knowing that my elk was secure I hurried on down the gulch to see if he had killed the bull. I met Billy coming back and said "he had shot the big elk but did not know whether he had killed him or not. We hurried down to the creek and in a short time found him lying in the middle of the creek, stone dead, and in water about twelve inches deep. We now had a big job of dressing on our hands, having six dead elk in a radius of less than half a mile. When we had finished dressing the last elk it was almost dark; this being our first day in the hills we had some misgivings about reaching camp that night. We were tired, hungry, and for my part, wet feet and no coat.

We started for camp; and night coming on, we took our course by the stars. The mountains and gulches all looked alike in the darkness, and finally Billy gave out and lay down, and begged of me to go on and find camp and leave him there until morning. This I refused to do; and at last succeeded in getting him started when I offered to carry his gun. We felt somewhat "shaky" as we passed through one creek bottom thickly timbered with cottonwood and underbrush, for we were out of ammunition and had nothing to defend ourselves with except my hatchet in case of an encounter with a silvertip, for these bears are quite numerous here on Bates Creek. But fortune favored us in that respect, for after climbing to the top of another high ridge we discovered our camp-fire burning brightly away down on the creek bottom about a mile off, and could faintly hear the report of a signal gun that the boys at camp were firing for us. In due time, almost played out, we reached camp. We soon had a pot of steaming coffee and a panful of fat elk stake frying over a hot fire, as we had taken the precaution to bring in a tenderloin for our supper.

The three days following were spent in packing our game to camp. Then we turned our attention to the blacktailed deer. Elzy and I struck out one morning for a place in the Hole seven miles below our camp, where a hunter had informed me deer were to be found among the pine gulches. Reaching the edge of the Hole we picketed our horses on a nice grassy slope there being no snow here, and then clambered down the steep sides of a chalk bluff. Reaching the bottom, we were slowly walking down a narrow cañon, when glancing up another cañon to our left, we discovered a bunch of deer looking at us. I raised my gun and fired, but too quick, and missed my mark, and the deer went bounding off up the mountain side. We both fired again, and this time with better results, for two deer fell dead. We dressed them quickly and hung them up as high as we could on a dead cedar tree, out of reach of the bears, for this was a wild gorge and bears were said to be plenty here. They had the night before devoured two deer which had been killed by a hunter who camped near us. Elzy was now in high glee, for this was his first deer; and he was eager to be off on the chase again. We now started on a circuitous route for our horses, thinking to take our game to camp with us that night, but after climbing to the top of another chalk bluff we suddenly came upon a band of ten or twelve deer. Elzy had dropped behind and sat down on a large rock to rest. I at once opened fire on them and emptied my repeater as they went over the ridge some one hundred yards distant. Going up, I found that I had three dead deer and one large four-point buck had his back broken; him I soon despatched. It was some time after dark when we reached camp, but Elzy's horse being a good leader we came in without much trouble; a horse that is good to follow a trail is a fine thing to have in these hills after dark.

On reaching camp we found that we had new neighbors. Two brothers of the name of Gregg, of my acquaintance, had got on our trail and followed us in to the hunting grounds, so on the following day they went with us on a deer hunt. We all rode our horses to the Hole and picketed them on the same grassy slope as before, and then took an elk trail down on to a bench in the Hole. I soon spied a band of deer feeding on a slope of the hill some distance below us. I told the boys to remain where they were, and I would get around below them and drive them back, but the boys, in their eagerness to secure a shot, had ventured too near the edge of the bluff, and had startled the deer, for I saw them go bounding around a point below me. I ran as fast as I could around the next chalk ridge, and came out on the point overlooking the glade into which I had seen the deer go. Crawling out cautiously I saw the deer, six in number, standing some distance below me looking back at the boys, who were now coming down the glade. I raised my gun and fired and wounded one. They sprang forward

a few paces and again stopped, not knowing whence the shot came, but thinking it was from the boys below. This time too fine deer stopped side by side, and taking very deliberate aim I fired, and had the satisfaction of seeing both deer fall dead on the spot, which is something that seldom happens, as a deer is very hard to kill instantly. I have known them to run more than 100 yards after being shot through the heart. I fired several more shots in rapid succession as the deer bounded away, and succeeded in killing one more and breaking the leg of the fourth one, which was soon overtaken and shot by Chas. Gregg. The Gregg boys killed three more before night, and it was again long after dark when we reached camp. The next day we succeeded in reaching the top of the ridge above the Hole with a four-horse team, and Charles Gregg killed another fine buck, making fourteen in all. Then we packed out to our wagon, and reached our camp late that night with a load of deer.

The next day was stormy and we lay in camp. The following day as I was unloading an elk pack from my pony I saw a large blacktail buck going over the hill about half a mile above our camp. I called Elzy to take my pony while I hurried off down the creek, intending to head him off. This I succeeded in doing, and killed him after firing three or four shots at long range. He was a very fine, fat fellow. The next day we went on an elk hunt for the Gregg boys, as we had all the game we could haul. Some five miles from camp we came in sight of a herd of three or four hundred elk. I and Elzy went to the left of the herd, while the Gregg boys passed around to the right. The elk getting the wind of us, passed over a ridge and came into range of the guns of the others, when they opened fire on them and after a hot chase they found that they had five fine elk dead on the mountain side, where, by "snaking" them a short distance with a horse, we could drive to them with a wagon. This made it much easier to get them to camp than to pack them in on our horses.

Having now two full loads of game, we at once made arrangements to pack up our wagons and start for home, as we were very anxious to get over the plains before the bad storms set in, which so often happen here at this season of the year. On our journey down we shot a number of antelope, and Elzy had some fine sport shooting sage hens with a small squirrel rifle. After nine days' hard traveling we reached home. A. A. K.

Berthoud, Larimer County, Col.

TEXAS ATTRACTIONS.

I SEE in the columns of your paper many communications from the Southern States and the Pacific coast, each setting forth the advantages of some particular locality as a winter resort for Northern sportsmen. I do not know that this part of the republic possesses any marked advantages over all the balance of the globe, but if any of our Northern brethren are casting about with the view of selecting a place where they can find reasonably good shooting and fishing during the winter months they will certainly not be disappointed by a trip to the Gulf coast of Texas. Almost any spot on the coast, away from the vicinity of the cities and large towns, will furnish all the amusement the most ardent "outer" could desire. The great drawback, however, is the inaccessibility of most of the favored locations. I have shot and fished over many a mile of the coast; and, in my opinion, Indianola, on Matagarda Bay, offers the best inducements to a sportsman, as the place to establish his headquarters. From there short excursions can be made in different directions accordingly as one may be seeking waterfowl, bay birds, deer, turkey, alligators (on sunny days), or quail (partridge, Bob White, etc.—take your choice). The waters of the bay teem with several varieties of excellent fish, including redfish, weakfish (called trout here), pompano, etc. I have eaten the bivalve from Maine to California, but nowhere found them superior to Matagarda oysters.

Market hunters and skin butchers are warned not to come here. You are not wanted to begin with, and it would not pay if you were. It is not a question of game but of markets. There is no market nearer than Houston or Galveston, and all kinds of game can be bought in those markets for less than the freight charges from this place. Two hunters came here last winter and in less than a week killed over 1,200 ducks, geese, and other water fowl, which they shipped in a refrigerator car. One of the men told me subsequently that they lost sixty dollars on the venture, notwithstanding their ducks arriving in good condition, and struck the market at the best possible time—a week before Christmas. I will take pleasure in furnishing more extended information to any one who will drop me a line and express a desire for it. Dago.

Victoria, Tex., Oct. 20.

WIRE CARTRIDGES.

Editor Forest and Stream:

In your issue of Oct. 1 "N." wants to know whether the use of wire cartridges will injure his gun. "C. A. R." in reply, Oct. 8, says they will, and "Accomac," in same issue, rather indorses that opinion of "N.'s" gunsmith. To me, this is very amusing. I have used the wire cartridge ever since I have done any shooting, and used them extensively, too, when in pursuit of the larger game especially, if extremely wild and difficult of approach, when long shots were a necessity. Most of the time I used a muzzleloading double gun of 11-bore, but I have shot the cartridges from my breechloader cylinder barrels. I never observed the least injury or any undue wear on the gun; the notion that injury would result is all bosh. How a charge of shot, packed in soft bonedust and inclosed in a soft copper wire case, could injure a gun barrel is a question that would puzzle "N.'s" gunsmith or anybody else to solve.

I will admit that it will not do to use a wire cartridge, a thread-wound cartridge, or, in fact, any prepared shot cartridge in a "full choke" gun, for the shooting, instead of being improved thereby, will be actually ruined, both in force and pattern; and the reason of this is obvious, for the shot cartridge, the instant it is put in motion by the powder, is "jumped up," as it were, to the full size of the barrel at the chamber; upon reaching the "choke," where the barrel is smallest, it must of necessity, if I may use the term, be jumped back again, or elongated and reduced in diameter sufficiently to pass the "choke." This undue force at the muzzle is apt nearly every time to tear the cartridge asunder and utterly destroy its efficiency.

In a cylinder-bored gun the wire cartridge performs admirably. It is more certain and effective in its delivery than any other shot cartridge I know of, and I have tried most of them; one can make long-range shots where a loose charge would be fruitlessly thrown away. Backwoods.

MINNESOTA GAME NOTES.

A STRANGER, leaving the train at Swanville and driving to this village (two miles) might easily imagine that two immense armies confronted each other and a lively skirmish was going on. Crack! bang! sound rifle and gun from every stream, lake, slough, valley and hillside. Every man carries a gun of some description, and every dog with life enough to bark or "tree" anything is in active demand. Notwithstanding the wholesale slaughter of the past two years, ruffed grouse are even unusually plenty. Yesterday L. La Rue, with a singlebarreled muzzleloading gun, bagged twenty-five, Henry Aleshire fifteen, and from ten to twenty in an afternoon are only considered fair sport.

Rice Lake and Big Swan are teeming with ducks, principally mallards. The wild rice crop is the largest we have had for many years, and birds are found in prime condition.

Lumbermen and others who have been back into the woods report having seen many deer and lots of "sign."

Some ten or twelve bears have been killed in this county within the past month, and almost every day brings the report of one having been seen here or there. Last week I was in high glee, a report having been brought in that a young man named Ireland, while out after the cows, had been attacked by a bear and sustained a fracture of one arm and other injuries. Of course I was sorry for the young man, but then I'd been waiting twenty years for an authentic instance of a black bear wantonly "pitching into" a man, and of course felt elated that the hour had arrived when my doubts would be removed and the ferocity of the beast fully established. I waited in suspense for the messenger to arrive—he was said to be on the way—who would summon me to afford surgical relief to the sufferer. No messenger arrived until the day following, and then the terrible catastrophe was narrowed down to the fact that Ireland's dog had had a fight with some animal, name and antecedents unknown.

Small fur-bearing animals are plenty, and I notice that the sagacious muskrats are building four-story houses; so of course we are in for an open winter and floods of water.

The weather is simply delightful, and I wish all Eastern readers of the grand old Forest and Stream could have a week's shooting in Minnesota. J. Frank Locke.

Pillsbury, Minn., Oct. 14.

SIDE-HUNTS.

THE annual side-hunt of the Lowell (Mass.) Rod and Gun Club was participated in by twenty-seven members. The game was counted as follows: Deer 500, eagle 200, coon 150, fox 150, mink 150, duck 100, snipe 25, hawk 25, bluejay 5, ringneck 10, rabbit 50, red squirrel 5, porcupine 50, muskrat 10, partridge 100, woodcock 100, quail 100, plover 100, yellowleg 100, wild pigeon 50, crow 25, owl 25, sandpiper 5, hare 50, gray squirrel 50, woodchuck 25, weasel 10, fresh water fish or eels, per pound, 25. The agreement was that the hunt should begin at 12 o'clock Wednesday night and continue until 12 o'clock Friday night, all the fish and game to be counted that should be delivered at 7:30 Saturday night, when the count began. The hunters were not restricted as to territory, and some of them went up into New Hampshire as usual, and others down into Maine, while the hunting places in the woods around Lowell were thoroughly scoured. The contest was won by the Wheeler team, score 31,383 points, the Frost team securing 22,903 points. The latter lost a great many points by the failure of five members to deliver their game before 7:30. The person into whose charge it was given misunderstood his instructions. However, the loss by this mistake was not enough to overbalance the score of the Wheeler side, if it had been counted. The game captured was as follows: Fox, 1; coons, 6; gray squirrels, 191; red squirrels, 180; rabbits, 36; hare, 1; woodchuck, 1; hedgehogs, 3; muskrats, 110; woodcock, 14; quail, 47; plover, 3; yellowlegs, 2; ducks, 151; snipe, 3; crows, 38; hawks, 7; bluejays, 87; sandpipers, 11; ringnecks, 1; fish, 219 pounds. The fishermen who were notably successful were Frank H. Harris and J. F. Hayes, who secured a 25-pound string of pickerel, some of them weighing 2½ pounds each; Peter Corcoran, who also caught a fine string of pickerel, and George A. Marden, who brought in a string of twelve bass which weighed 26 pounds, the largest turning the scale at 4¼ pounds. His pickerel, perch and other fish brought the score up to almost 1,400.

Wheeler's side.—Morrison and Sawtelle—31 red squirrels, 73 grays, 3 partridges, 7 bluejays, Score 4,140. A. Crowell—1 crow, 4 bluejays, 9 red squirrels, 4 grays, 3 partridges, 590. Geo. A. Marden (fish)—12 black bass (weight 26 pounds) 9 pickerel, and perch, etc., total score 55¾ pounds, 1,393. Charles Runels—1 hawk, 24 crows, 8 red squirrels, 11 grays, 1 partridge, 8 bluejays, 1,355. H. E. Hartford—1 partridge, 1 hawk, 4 bluejays, 6 reds, 1 gray, 1 plover, 325. Peter Corcoran—28 pounds fish, 1 gray squirrel, 5 rabbits, 950. F. E. Putnam—3 red squirrels, 2 partridges, 215. W. H. Hope—11 gray squirrels, 1 red, 5 rabbits, 1 partridge, 7 bluejays, 940. S. C. Smith—5 gray squirrels, 1 red, 255. Partridge and Young—4 partridges, 2 red squirrels, 3 grays, 1 rabbit, 1 bluejay, 615. F. S. Berry—2 hawks, 1 woodcock, 2 quail, 1 bluejay, 8 red squirrels, 295. Henry Boynton—4 partridges, 8 quail, 1 hawk, 2 bluejays, 1,235. Sargent and Gay—7 partridges, 7 grays, 1 black duck, 1 muskrat, 1,160. L. A. Derby, S. H. Jones, Charles Wheeler, J. A. Faulkner, W. H. Burton, J. G. Favor, W. H. Bagshaw, N. Brown, George Moore—8 partridges, 11 gray squirrels, 7 reds, 26 quail, 1 snipe, 2 woodcock, 1 sandpiper, 2 rabbits, 136 ducks, 17,916.

Frost's Side.—Hartford and Derby—82¾ pounds of fish, 2 ducks, 3 partridges, 4 bluejays, 3 crows, 26 red squirrels, 10 grays, 3,258. Hayes and Harris—31 pounds of fish, 24 red squirrels, 3 grays, 10 rabbits, 6 partridges, 2 ducks, 1 woodcock, 11 bluejays, 1 crow, 1 woodchuck, 2,550. F. H. Parker—22 pounds fish, 4 red squirrels, 11 grays, 2 partridges, 1 crow, 1,346. C. F. Foss—4 red squirrels, 5 grays, 4 bluejays, 6 woodcock, 5 partridges, 1 rabbit, 1 crow, 1,465. E. Whitman—4 red squirrels, 10 grays, 5.0. J. H. Joyce—16 red squirrels, 10 grays, 5 bluejays, 2 snipe, 1 plover, 1 partridge, 855. Richardson and Smith—5 red squirrels, 10 bluejays, 4 partridges, 1 hare, 1 hedgehog, 575. G. C. Bates—1 muskrat, 12 bluejays, 29 red squirrels, 8 grays, 1 yellowleg, 1 rabbit, 1 sandpiper, 10 partridges, 6 crows, 2 hedgehogs, 1 fox, 2,170. Downs and Varnum—4 sandpipers, 1 bluejay, 1 red squirrel, 1 gray, 7 partridges, 1 duck, 1 yellowleg, 6 quail, 1,580. A. J. Derby—5 partridges, 6 quail, 1 gray squirrel, 2 reds, 1 rabbit, 1 bluejay, 1,215. Frost and Morrill—4 rabbits, 21 partridges, 5 ducks, 1 ringneck, 5 sandpipers, 1 bluejay, 2,840. S. Farrington—15 red squirrels, 4 grays, 1 rabbit, 1 partridge, 1 crow, 4 bluejays, 479. M. J. Brown—1 red squirrel, 1 bluejay, 3 rabbits, 2 partridges, 1 hawk, 335. Stiles and Owen—7 red squirrels, 7 grays, 3 rabbits, 3 bluejays, 1 hawk, 9 partridges, 1,425. E. B. Conant—4 woodcock, 400. Stevens and Runels—6 coons, 900.

Worcester, Mass., Oct. 22.—The following are the results of the annual hunt yesterday by the members of the Sportsmen's Club of this city:

Capt. A. H. Perry.—W. S. Perry, 5 partridges, 1 woodcock; E. S. Knowles and G. J. Rugg, 2 partridges, 1 woodcock; A. H. Perry, 1 partridge, 5 woodcock; W. L. Shepard, 2 quail, 1 woodcock; R. L. Golbert, 8 partridges; M. A. Linfield, 7 partridges: W. H. Cole, 2 partridges; J. F. Davenport, 5 partridges; B. Mann, 9 partridges, 1 rabbit; A. B. F. Kinney, 1 fox, 4 partridges, 1 woodcock; D. S. Jackson, 9 partridges, 1 woodcock, 3 rabbits, 1 gray squirrel; M. D. Gilman, 2 partridges, 1 gray squirrel; R. J. Healey, 5 partridges, 2 woodcock; V. Sheldon, 12 partridges, 2 woodcock; A. O. Benoit, 4 woodcock, 2 partridges; F. A. Knowlton, 2 partridges; E. E. Frost, H. B. Verry and W. G. Strong, 7 partridges, 2 woodcock; E. W. Sweet, claim by telegraph, 8 partridges; W. L. Davis, claim by telegraph, score of 680.

Capt. J. A. Titus.—L. J. White, 2 quail; Alzirus Brown, 4 partridges, 1 gray squirrel; E. T. Smith, H. M. Quimby and C. B. Holden; 8 partridges, 2 woodcock, 1 rabbit; L. E. Divoli and W. Thayer, 4 partridges, 2 woodcock; J. A. Titus, 3 partridges, 1 quail, 1 woodcock.

The total amount of game brought in was 101 partridges, 20 woodcock, 5 quail, 5 rabbits, 3 gray squirrels, 1 fox, 1 owl.

ANOTHER DAY WITH THE SQUIRRELS.

ON the morning of Sept. 4 three boys of the old school (one of them being past seventy years of age) might have been seen starting out on a squirrel hunt. Two of them carried rifles, while the eldest one was armed with a stout cane. Uncle John was so highly elated over our success with the ducks the day before that he concluded to take another holiday and let the "crops" take care of themselves. During the tramp to the "oak lot," as Uncle John called it, the conversation turned upon sharpshooting with rifles, upon ancient and modern arms, etc. He said that in his younger days he had practiced off-hand with his rifle at a burning candle (the purpose being to enable him to shoot at the eyes of wild animals at night in "fire hunting") and had snuffed the candle three times out of five at thirty yards with the old muzzleloading rifle and globe bullet. Also he informed us that he had "driven the nail, shot after shot, when in practice, while barking off squirrels was an every-day affair." "Yes," he said, "old men are always telling what they did when they were young, but I believe that I could shoot now if my eyes were all right so that the sights on the rifle would look plain to me, but it is of no use, my rifle shooting days are over." I mentally made a note of his remarks, for knowing that the Lyman sight is just the thing for "old eyes," I determined to get the old man at it in competition with Jack before night.

We turned into a pasture where there were a few oak trees growing alongside of the wall, and upon nearing one Jack signaled us to stop. He raised his repeater, and as he did so I saw a large gray squirrel crouched upon a limb about fifteen feet from the ground. The bullet struck the limb, but struck it too low, and although it knocked the squirrel off on to the ground, he quickly ran up the tree again and mysteriously disappeared. We looked the tree all over as well as we could from the ground, but could see nothing of him. "Gone into a hole," suggested Uncle John; "climb the tree and punch it." Jack was soon up the tree and found the hollow where the squirrel had hidden. "Give me one of those long sprouts from that apple tree," said he, and as soon as he ran that into the hole the squirrel started for the ground. Uncle John shied his cane at him and shouted to me to "take after him" and drive him up the next tree, which was some forty yards further down the wall. I started after him as fast as I could run; but being rather corpulent I presume that I did not make a very graceful appearance. "Whoop-la, whoop-pee!" yelled Jack, "go it, Maud S.; bet you a dollar that you don't tree him." About twenty-five yards down the hill another stone wall with a rail for a top rider ran at almost right angles, and for some unaccountable reason the squirrel turned and ran along the top of those rails. This maneuver was too much for Uncle John to witness and stand around with his hands in his pockets, for promptly catching up my muzzleloader, and taking aim at him on the run he fired and the squirrel came to the ground shot through the hips and scrambled into the wall, but we soon had him out and in the game pocket. The old man was excited over his shot and said that my sights were the best for quick shooting that he ever saw. John said he wanted Uncle John and I to run a race of 100 yards, and he would "bet five dollars on Uncle John." The old gentleman declined with thanks, however. "Jack," I said, "I propose that after lunch you and Uncle John shoot twenty paces at acorns stuck upon the end of a stick and the acorn to be fairly struck or not to count. Uncle John may use my gun and we will again test the old muzzleloader against the modern breechloading repeater for accuracy. If you win I will pay for that box of cigars at Smith's, and if he wins you may have the same privilege." "All right," said he, "it's a bargain, ten shots each and use a rest over the lower fence rail."

As the day was warm we did not get out of the shade much, but kept in the woods. Jack killed two gray squirrels, while I succeeded in getting one and clipping off the head of a ruffed grouse. Uncle J. used my rifle on several red squirrels and chipmunks, and the execution that he performed upon them clearly foretold the result of the acorn match. We were passing through an orchard when Jack discovered two hedgehogs up in a sweet apple tree. He went to work on them with stones, but they seemed to enjoy the sport as much as he did, and the stones bounded from them like a rubber ball, but after a while a stone struck one of them in the head and down he tumbled, while Uncle J. finished him with his cane. "Now," said Uncle J., "let's see you shoot the other one. Do not hit his head and you will have a target the rest of the day." Crack went Jack's rifle; *ker-klut-uk* went the lever—bang goes the gun again, and five bullets were used before he was dislodged from the tree, and again Uncle John's cane was used to finish him with. They are the most disgusting animal to look at that I ever saw.

After a lunch which we enjoyed with keen appetite we found a suitable place for a rest, and the shooting at the acorns began. Uncle J. hit eight of them fairly, one cut off the stick below the acorn, and one missed it. Jack hit five fairly, cut the stick three times, and missed twice, the bullets making a good line but going over. Thus ended the shooting, part of one of the most successful as well as one of the most enjoyable outings that I ever enjoyed in my life.

I have not written letters the past few weeks for the purpose of a free ad. in the FOREST AND STREAM, for I have had more work than I can do already, and write over a *nom de plume*, and always have. My experience has been that a muzzleloader will shoot closer at short range than a breechloader, consequently it makes a better squirrel rifle. There is plenty of time to load. Regarding the Lyman rear sight, I have no pecuniary interest in the manufacture or sale of them, in any form whatever, neither have I ever had the pleasure of meeting Mr. Lyman, but what I have written has been for the benefit of the reader, as my own shooting has been very much improved by using it, especially in the woods or in bad light.

Why can we not have more mechanical notes regarding the making and repairing of rifles and guns in the columns of FOREST AND STREAM. I think that the exchange of ideas upon the subject would be a benefit to gunsmiths as well as amateurs, for the days of "trade secrets" have passed. I for one would be willing to contribute toward it, and although I do not pretend to know it all have tried to learn all that I could about it during the past twenty years, and having one of the best rifle makers in the United States for a teacher years ago, perhaps I might suggest something that would be of interest to some that are anxious for information upon the subject. IRON RAMROD.

LOST IN THE MAINE WOODS.

Editor Forest and Stream:

This morning I met a friend whose face always brings to my mind the good and hard times I had in the Maine woods. The first thing he said was, "Fred, there is a fine story about you in the FOREST AND STREAM." I hunted my paper over until I struck "Camps in the Wilderness," by "Kohog," and it was with pleasure I read the names of places I have not seen for years. The guide's story about the young chap from Massachusetts is good, but it would have made a more interesting story if he had staid somewhere near the fact. The guide was about fifteen years old, and the "pard" he speaks of was a peddler who had strayed away up there, seeking whom he might devour. It is also true, alas, I did think I could make lots of money up there trapping, but instead of being there only a week, as the story states, I had been there ever since September. We did not start late the following day, but early one cold morning after Mrs. Flint had kindly put up some lunch for us, and he forgets to say how he forgot his gun, leaving it standing in the snow against a stump. That day about sunset we struck solid ice, a little below where you start in for Upper Metallic's Pond. We made camp and ate almost all our lunch. Although we had a roaring fire, the water in a tin pail froze, though standing but a few feet from the fire. Early next morning we broke camp, and after eating the rest of our lunch, we hauled our boat on the ice, intending to shove it along till we came to open water, but we had not gone far when I broke through the ice. Then we pulled for shore again, to our old camp, and built a big fire, at which I was drying myself while the peddler was cruising around to get the lay of the land. I remember we were all very hungry by this time. I was just thinking and toasting my shins when I heard the peddler sing out, "Walter, bring the rifle and ammunition!" W. B. grabbed my rifle and powder and ball and ran off, and pretty soon I heard my rifle crack four times in quick succession. I soon heard them coming back, and when W. B. came in sight I saw to my joy that he carried three plump partridges. We fried two right off in my frying-pan. By this time it was nearly noon. We held a council of war, and neither the peddler nor W.B. knew how to get back to Spoff. Flint's camp; but finding we were but a short distance from Metallic's Pond, I knew we were all right; for I knew there was a spotted line from there to Lincoln Pond, where I knew there was a boat hidden, and a camp, with possibly some grub in it, and another spotted line from there clear through to Sunday Pond Camp. That cheered them up amazingly. We reached Lincoln Pond late that afternoon, as hungry as wolves, and tired to boot. Having left my pack behind, to be able to show them where the boat was, I now started back, while they worked the boat over the ice to the open water. Well, after a while we got over to the camp, and all we found was a bottle of tar oil and a box of candles.

Did W. B. tell your correspondent how we all, himself included, tried to eat some of these candles? Woke up cold and hungry next morning, cooked our remaining partridge—hardly a fair mouthful apiece—and shoved off. It was cold enough that morning, for the wind blew the water on our hands and it froze on my mittens. We struck the shore at last and started up hill, keeping our eyes open for blazes on the trees. We began to suffer in earnest by this time, for we were half frozen and faint with hunger and Walter was crying like a good one, while the peddler was washing the boy's hands with brandy and I begging him not to carry on so, telling him we would soon be all right. I acknowledge leaning against a tree once and saying something about sitting down, and remember hearing the peddler say something about switches, but they were not needed, nor were their feet either, as W. B. states with zeal worthy of a better cause and twisting up of facts truly diabolical. Then the idea of carrying my baggage. I remember distinctly how heavy my eleven or twelve-pound rifle got about this time, so I left it standing by a tree. When we got to the river we found a little raft. It was not big enough to take us all over at once. I crossed first, and ran to camp, telling Spoff. to go down and help them over, which he did by felling a tree across the river, on which they crossed, and by the time the peddler and W. B. got to camp there was a square meal on the table for them, and no cold nor warm venison about it, nor a bit of venison about the house in fact. Having on only a pair of moccasins I froze my feet badly, my left foot being nearly black. I thawed them out in a tub of ice water. A day or two later Nahum Bennett came up from the settlement through the woods to find us, the report having got out that we had started days before, and our non-appearance naturally made them think we were lost in the woods; and old Nahum Bennett, dear old soul, was the first to volunteer to find us. John Danforth came up from the settlements, and on the way to his camp called on us, and I followed his tracks through the woods for 16 miles (I was told it was) arriving at an old lumber camp about sunset, where I camped that night, making the settlement early next morning.

Quite a little difference in the two stories.

I have been in the West for nearly three years and a half, have only been home some months, roughed it in the Rockies and on the plains. I don't believe W. B., "Kohog's" guide, knows what a tenderfoot is.

THE YOUNG CHAP FROM MASSACHUSETTS.

GAME ABOUT SENECA FALLS.

Editor Forest and Stream:

Winter ducks have made their appearance here and a fair number have been brought to bag by our local sportsmen. Cayuga Bridge, at this end of the lake, has for many years been a noted ducking ground and a favorite resort for wildfowl during spring and fall flights. Its former glory has, however, largely departed during the last decade, as the incessant fusillade kept up on the ducks from their arrival to departure, and perhaps other causes have driven them to wilder and more remote feeding grounds. Still through all manner of both fair and unsportsmanlike devices, a large number are killed every season. If more interest were manifested by lovers of sport in this section, hunting and fishing could be much improved.

Two flourishing sportsman's clubs formerly existed here and were prominent at all meets of the State Association, numbering in their delegations some of the best shots in the United States. The olden, spirit, however, seems to have died out and the ranks are disbanded. The Phœnix Club, like its ancient prototype, went out without a flicker, and as yet no signs of a revivification. The Seneca Gun Club expired of inanition about a year since. The members of the two defunct organizations, to a certain extent, keep up the old traditions of "flood and field" within the cozy precincts of Lawrence's "Cottage," where many of the trophies and specimens of the old clubs adorn the walls. Mr. Lawrence is an expert taxidermist as well as an enthusiastic naturalist, and his place of business is a veritable museum of quaint artillery, curiosities and specimens of natural history, forming a very unique and interesting amateur collection.

At this time coon hunting is the prevailing rage, as the "ringtails" are unusually numerous and fat this fall, and scarcely a week passes that two or more parties do not devote a night to the fascinating pursuit of Davy Crockett's friend. Lawrence usually heads the hunters, being equipped with a number of well-trained hounds and all the requisite paraphernalia for such expeditions. A dozen sportsmen with as many hounds, axes, torches, etc., *ad libitum*, are a familiar sight here, on an early moonlight evening, and enough to "make Rome howl"—as well as the men who own the cornfields and forests where the coons "do most congregate." The largest number brought in so far, as the result of a single night's foray, was eight—headed by a noble patriarch of 20 pounds, and tapering down to a plump 8 pound "kitten." Last night three were brought in, weighing respectively 19, 16 and 15 pounds. A large and ambitious party of hunters are preparing for the warpath to-night, and sally forth determined to "clear out all the coons left in the county. The invariable wind up of these expeditions is a coon barbecue at the "Cottage," prepared by a sable son of the sunny South in true Virginian style, to which appetizing "layout" a free invitation is extended to all.

A few quail are shot here every fall, but the demoralizing effects of an occasional cold winter keeps the number down of this beautiful game bird. Rabbits are abundant and promise good sport for the approaching season. The heavy timber in this part of the State (one of the earliest settled portions) is largely cut off and cleared, so that there is little suitable cover for ruffed grouse. Nuts of all kinds are abundant this season, but squirrels are very scarce. The longtails were quite plenty in 1884, but the severity of the weather and heavy snows of last winter seem to have killed them off or caused their migration. L. G. S.

SENECA FALLS, N. Y., Oct. 24.

HE PAID HIS FINE.—Game Warden Allen of this city was at the Maine Central depot one evening last week on the arrival of the train from up-river, when he noticed the hides and antlers of a moose and caribou in the baggage car en route to Boston. From their dry appearance he was convinced the animals to which they belonged were killed prior to Oct. 1, the beginning of the open season, and accordingly he took possession. Going through the train he found a gentleman who was apparently returning from a hunting expedition, and questioning him was told that the property seized belonged to him, but the sportsman asserted that he had killed no game during close time. Examining his diary he stated to the officer that the moose in question was killed Sunday, Oct. 4. He was then informed that Sunday was close time the year around, and the gentleman, who is a prominent resident of New York city, finding he was caught, paid the fine for the moose, amounting to $100. Mr. Allen said he was convinced that the caribou was killed in close time, and that he should keep the hide and have the gentleman indicted so that he might be held to answer to the charge whenever he came to Maine. Upon hearing this the New Yorker inquired the name of the Fish and Game Commissioner and left on the train. Several days later Commissioner Stillwell received a letter from the gentleman, acknowledging that both animals were killed in close time and inclosing thirty dollars to pay the fine on the caribou, he having already paid that on the moose. He requested Mr. Stillwell to inform Mr. Allen that the fines were paid and ask him not to institue proceedings against him.—*Bangor Industrial Journal, Oct.* 23. And here is another: Bangor, Oct. 24.—Game Officer French visited Dobsis' club house with a search warrant and found part of the hide of a moose killed in close time. He arrested G. F. L. Ball, the club's keeper, who has settled the case for $100 and costs. Officer French has warrants for two members of the club and two guides who assisted them in violating the law.

PHILADELPHIA NOTES.—Oct. 25.—Quail are very scarce in our markets, and but few sportsmen have gone out, although the close season ended Oct. 15. This is a silent confession on the part of both amateur and professional gunners that the opening is two weeks too early. I doubt if you can find a single sportsman who would not say that Nov. 1 is the proper date for the beginning. Birds, I am told, are more plentiful this year than last; and yet none that I can find are on the game stands. The truth is while the leaves are yet so thick on the trees and the weather so pleasant the quail do not come out to feed. "They do not have to," and will remain indoors until a little sharp weather drives them out to hunt a breakfast. Ducks still arrive in our rivers, the number of stiff-tails that have come this year is beyond anything for years. Twenty-five to thirty per boat are the average returns each day below Chester. Woodcock seem to be very scarce this autumn. Stop summer shooting and we would have more of them.—HOMO.

NEW JERSEY.—The open season for quail and grouse in New Jersey opens usually on Nov. 1. But Nov. 1 this year being Sunday, the shooting will not begin until Monday, Nov. 2.

SNARERS IN CONNECTICUT.—Norwich, Conn., Oct. 24.—Your note of the grouse snarers at Stafford some weeks ago attracted my attention. It has been my custom to go up there for a few days' shooting for several seasons past. I have seen the remains of old snares but never found any set until this season. I was hunting over a long ridge, thickly covered with white birch and sloping off to a brook in the valley. I had started a grouse down the slope and across the brook. I was following, and reaching the brook found a grouse strung up by the neck in a snare, I bagged the bird and kicked up the snare. A short distance on I found another snare. Then I returned to the brook and began a careful search and in less than an eighth of a mile along that brook I found seven or eight snares, one more grouse, and the feathers and head of one that been eaten probably by a fox. I bagged two good birds and kicked the snares to pieces. If I had not been looking for the snares I might have hunted the whole slope without finding one-half of them, for they were so built as to escape notice unless one was looking for them. Reports from all quarters about here say there is a good supply of birds. I have not heard of any large bags, but most all manage to get some. A party of six have just come in with 38 gray squirrels, 8 grouse, 8 quail and 2 woodcock.—J. R. T.

THE LINE OF COOT SHOOTERS.—New York, Oct. 20.—If any of your acquaintances want to shoot ducks "in line," tell them to write to Geo. M. Averill, The Ark, Branford, Conn. The cost of the trip to Branford is ridiculously small, as the men with whom you come in contact are all honest and not anxious to get wealthy. A line is formed almost every day now, and gunners kill from ten to fifty ducks each daily. The ducks which are killed are principally surf ducks, white-winged scoters, black scoters and south southerlies. Occasionally scaups, dusky ducks, sheldrakes, ruddy ducks, etc., are killed, and a stray eider or goose will often make the stem of your boat attractive. The surf ducks and scoters, which go by the name of "coots," and the south southerlies are delicious eating if they are skinned before being cooked and have a layer of strips of salt pork pinned in the breast with wooden toothpicks. Plenty of gravy and apple sauce are called for. As far as excitement goes, our country can furnish nothing in the sporting line to exceed coot shooting. —MARK WEST.

ONTARIO VENISON.—Niagara Falls, Ont., Oct. 21.—Yesterday morning ten or twelve deer were sent from Haliburton, Ont., to Black Creek, Ont., consigned to J. H. Allen and Charles Jenks. Special Constable J. R. Dowd, of Welland, followed, and about 9 o'clock caught Jenks, who was about starting off with a rowboat load of venison, and confiscated the lot, and placed Jenks and Allen under arrest. The venison was sold for what it would bring, and the men will be tried under the act prohibiting deer from being shipped out of the country.

ONE WAY OUT.—*Editor Forest and Stream:* As one way out of the difficulty I propose that we defer to the feelings of all the many men of many minds who read the FOREST AND STREAM, and call the bird by the alphabetically-compounded appellation, Colonbobwhitepartridgequail. It is awkward to pronounce, but there is this advantage, if we can once fasten the name no bird can ever get away with it, and we can then kill at every shot.—ORIOLE.

CONNECTICUT GROUSE SNARERS.—Hartford, Conn., Oct. 23.—The Litchfield County Market, 561 Main street, had 300 partridges on sale this morning. This is the season for these fine birds. But the thousands of snares in Connecticut and Western Massachusetts are evidently thinning them out. This market has probably sold over a thousand partridges this season.

CLEVELAND FIRE-HUNTING DUCKS.—Cleveland, Oct. 23. —Some people here are getting ducks without going far or using guns. During heavy winds here a few ducks are blown with the gale, and at night fly into the electric light masts and guys and are killed. I suppose they are attracted by the bright light.—W. R. W.

GAME IN WATER.—London, Eng.—In my letter about preserving game, which appeared in your paper of Sept. 10, there is a rather important misprint, caused, perhaps, by the indistinctness of my handwriting. I stated that the venison would remain fresh in hot weather for "several days"—not "several months."—J. J. M.

A LOAD OF WILDFOWL.—Casselton, Dak., Oct. 19.—I send you photo of game killed on a two-days' hunt by three sportsmen of this place; total number, 108 geese and brant and five cranes. That's the kind of hunting we have in Dakota.—H. P. UFFORD.

GUNS AT AUCTION.—There will be a great sale of guns, new and second-hand, in this city next Friday and Saturday. See the notice of same in advertising columns.

Camp Fire Flickerings.

"That reminds me."

171.

OLD MAJOR R. bragged very much about his shooting, but no one ever saw him kill a bird on the wing, although he would occasionally go out by himself when the snow was on the ground and bring in a very good bag of Bob Whites. He always said he shot them a-flying, and never missed a shot. But the general impression among the rest of us was that the Major hoofed them, as we termed it, *i. e.*, shot them on the ground. At last we got the Major to take a hunt with us. One Christmas morning found Dr. S., the Major and myself with dogs and guns on the way to Wheat's Valley. The birds were plentiful, and during the day the Doctor and I bagged forty odd, but the Major made never a shot during the whole day. "Well, Major," exclaimed the Doctor, "why did you not shoot at some of the birds to-day? You had a number of fine chances." "Well, you see, Doc., at this time of the season I always pick out the cocks when I shoot and leave the hens for breeding purposes. You may not believe it, Doc., but every blasted bird I have got sight on to-day was a hen, and I could not shoot a hen quail so late in the season when quail are so scarce."

CATAMOUNT OF THE PEAKS OF OTTER.

EDUCATION FOR THE INDIANS.—Washington, Oct. 16—*Editor Forest and Stream*: I was exceedingly glad to read your article in the last FOREST AND STREAM on "Teachers for the Indians." Having seen a good deal of the Indians and studied their condition at their own homes, so to speak, I indorse every word you say.—JEROME BURNETT.

Sea and River Fishing.

THE ANGLING TOURNAMENT.

THE morning of Wednesday, Oct. 21, opened with a drizzling rain that gave no promise of change for the better. At Harlem Mere a dozen enthusiastic anglers had gathered at nine o'clock, and from the door of the wall tent watched other enthusiasts testing rods and getting their arms limbered up for the contests. The rows of benches were empty, and two policemen, detailed for the day's service at the tourney, looked wearied and bored. Half an hour later the party had increased to twenty, and doubts were raised whether the contests would take place that day or be postponed. At ten there were many fresh arrivals, among them President Endicott and Secretary Mather, and to all propositions of postponement these gentlemen said "no," giving as reasons the facts that there was no assurance of better weather next day, and the presence of gentlemen from Baltimore and other cities who had come to cast and who might not return. A brisk wind was blowing from the east, and casting could only be done from the north or south. After much delay it was decided to stretch the measuring line to the north, and it was brought forth, stretched and the position of the floats verified or corrected, the line having been soaked for twenty-four hours previous. The platform was six feet square and one foot above the water. The line was stretched from one corner of the platform and had the usual buoys at every five feet. The judges' boat was on the beach, and the secretary began taking entries for the amateur class in single-handed fly-casting. No doubt the weather kept many who would have cast away, for the report was current in the city that there would be a postponement. There were eight prizes in the class and but four entries were made.

Of the judges appointed for this class, as published in FOREST AND STREAM and in the score book, two were present, Hon. James Geddes and Mr. Fred Mather. The latter declined to serve because a pupil of his, Wallace Blackford, had entered for the contest, and the president appointed Mr. Henry P. Wells and Dr. George Trowbridge, with Mr. Geddes as referee. The contestants drew for the order of casting, and cast in the order named: Samuel Polhamus, of Central Valley, N. Y., who has cast here in former years, and who is known as a very graceful caster, who keeps his line well clear of the water behind; Mr. Ira Wood, the best known of all and an "old timer," whose right to cast was questioned because of prize winnings in State sportsmen's associations or other tournaments, but who was eligible under the ruling that the National Rod and Reel Association had no records of, and recognized no other contests but its own; Master Wallace Blackford, the fifteen-year-old son of the Fish Commissioner, who last year cast in public for the first time and attracted much attention from his youth and skill; Mr. Wm. H. Goodwin, his first appearance. The drizzle increased and the wind became more fitful, being at the right of and a trifle to the rear of the men.

SINGLE HANDED FLY-CASTING—AMATEUR.

Open to amateurs, under rule 2, who have never won a first prize. Rods not to exceed 11ft. 6in. in length.

Scale of points: Distance, actual cast; accuracy and delicacy, 25 each (if a contestant cast 60ft. and is awarded 20 for delicacy and 15 for accuracy, his score will be 95). Delicacy should be judged by the lightness with which the flies light upon the water, and accuracy shall be determined by the judges The casts shall be made for delicacy and accuracy at the same time.

Name of Contestant	Length of Rod.	Wt. of Rod, oz.	Distance, ft. and inches	Delicacy.	Accuracy	Total.
Saml. Polhamus	11.6	9	74.6	20	20	114.6
W. H. Goodwin	11.5	8½	76.0	15	22	113 0
Wallace Blackford	11.6	9½	68 0	22	18	108.0
Ira Wood	11.6	9½	71.0	20	15	106.0

The wind beat down the lines in retrieving and twice tied Blackford's line in a bunch, Mr. Goodwin was scarcely less fortunate. The distances cast were shorter than in any previous amateur contest of this kind.

The salmon casting class was also lacking in entries, there being but three in a contest where five prizes had been offered. The entries were: Ira Wood, a winner in the amateur salmon class of 1883 (there were two classes that year) with a record of 98 feet; Reuben C. Leonard, winner of the expert salmon contest of 1883, with a record of 124 feet, and Ed. Eggert, who won in the single-handed amateur fly-casting last year, but who had never made a record in salmon casting. The drizzle had increased to a pouring rain when the class was called and nobody expected that such good throwing would be done in the beating down of the rain drops. As it was, Leonard exceeded his cast as winner in 1883 by one foot and beat all records in this country except that of Hawes, of 131 feet in 1884.

SALMON CASTING.

Judges: J. S. Van Cleef, John A. Roosevelt. W. C. Harris, Referee. Open to all. Rods not to exceed 18ft. Scale of points as in single-handed fly-casting.

Name of Contestant.	Length of Rod.	Wt. of Rod oz.	Distance in ft. and in.	Delicacy.	Accuracy.	Total.
R. C. Leonard	18	37	125.	18	12	155
Ira Wood	18	33	100.	18	12	130
Ed. Eggert	18	27	109.	10	8	127

It will be seen that Mr. Eggert's weak points were in delicacy and accuracy, but he cast a long line very cleanly. Mr. Wood also cast in a style that might be envied by many old salmon fishers, while Reuben Leonard's cast is perfection itself. He is as clean and beautiful a fly-caster as we have ever seen, his back cast is a marvel of beauty, the line straightening out behind at an angle above his head, and the powerful "swish" of the rod keeping exact time in both the forward and back motions. The only one who approaches him is his cousin, Hiram W. Hawes, who has exceeded him in distance but not in clean delivery. In this contest none of the casters got out more line than they could handle, and the consequence was that there were few accidents and less calls for "time." We thought that Mr. Wood cast exceedingly well in his trial for delicacy and accuracy, and admired the manner in which he laid his flies along the water.

The "Heavy Bass" class was called and the rain poured without intermission. It was proposed to have the trials take place on land in the same vacant lot where they were held last year, when some one suggested the Polo grounds opposite. Fortunately the secretary, Mr. Bell, was present and gave permission. This gave the audience not only cover but raised seats also, and only the contestants and judges were drenched. The lane system of previous years, which combined accuracy with distance, was abolished, and there was therefore a wide latitude allowed to the heavy 2½ ounce sinker to range in. This style of casting is identical with the "Nottingham" of English anglers. The weight or bait is reeled up to within two feet, more or less, of the tip of the eight or nine-foot rod, and is cast from a free-running reel controlled by the thumb. In this contest the records of this or any other country were beaten by the wonderful casting of Mr. W. H. Wood, who caught the big tarpum (Floridian tarpon) last spring.

The entries were: Ed. Eggert, his first appearance in this role; Mr. John A. Roosevelt, the winner of the three previous years, and Mr. W. H. Wood, first appearance in public; they cast in the order named. The following is the score:

HEAVY BASS CASTING.

Judges: C. G. Levison, W. S. Sheafer. W. C. Harris, Referee.

Name of contestant.	First Cast.	Second Cast.	Third Cast.	Fourth Cast.	Fifth Cast.	Average.
W. H. Wood	231	236	235	250	250	240 2-5
J. A. Roosevelt	204	202	186	187	190	193 4 5
Ed. Eggert	50	138	148	133	60	105 4-5

The minnow casting for black bass was called on the same ground as the last class, as it had been decided to have it cast on land instead of in the water, as was done last year. There were five entries in this contest and we know that four of them never cast a minnow for black bass in actual fishing and are in doubt about the fifth. It is a style of fishing not in use in the East and is an advance on bait-fishing with helgramites or dobsous. There were five entries: Mr. G. Poey, who, by the way, was accompanied by his 12-year old daughter who had her rod and would have cast had not the weather prevented; and four others, three of them new to this class, at least in public, while Messrs. Levison and Eggert cast in this class last year.

MINNOW CASTING FOR BLACK BASS.

Judges: W. C. Harris, H. P. Wells. Francis Endicott, Referee.

Name of Contestant.	Distance in feet & inches.	Delicacy.	Accuracy	Total.
A. F. Dresel	127	20	23	170
Dr. Geo. Trowbridge	123	20	20	163
G. Poey	112	20	25	157
C. G. Levison	116.8	20	15	151.8
Ed. Eggert	81	15	10	106

Prof. Mayer won last year with the following score: 97 feet, 25d., 15a.=137; therefore Mr. Dresel beat the record 30 feet, or 33 points. In fact the whole class, except Eggert, beat the record.

The expert class in single-handed fly-casting was called and ten entries were made. It was already 4 P. M. and dusk, rainy, and with every prospect of the last men finishing in absolute darkness. The first man, David Guthrie, was called to the score and cast. He was followed by Samuel Polhamus, and then Ed. Eggert stepped on the platform, when the judges, Fred Mather, Hon. James Geddes and J. S. Van Cleef, came on shore and reported that they could not do justice to themselves nor the contestants because of the darkness and the roughness of the water, and that it was impossible to see where the flies fell. The contestants were called together and they decided to have it out next day, rain or shine. After a meeting for election of officers all dispersed.

On the morrow the fair day brought out many spectators, and Messrs. E. R. Wilbur, C. G. Levison and Thos. B. Mills, all amateur photographers with improved apparatus to catch the fleeting fly. Mr. Polhamus was absent and two new entries were taken. The contestants were as follows: C. G. Levison, cast in former amateur contests and entitled to still, a very graceful caster. Martin Culhane, having a record in previous expert classes, but barred from the amateurs by reason of business. Geo. Landman, cast for David Guthrie, foreman in Malleson's rod factory. Ed. Eggert, winner of amateur contest last year with a record of 75 feet. Thomas Prichard, son of Harry, of 91 feet fame (1882) a weak, delicate boy of apparently 21 years and about 100 pounds weight but with a wonderful private record. Reuben C. Leonard, with a record as winner in 1882 of amateur class (87 feet) and other records. W. E. Hendrix, winner of amateur class, 1883, with 78 feet, and also records in other contests. W. H. Goodwin, first appeared in amateur class this year. Thos. B. Mills, a well-known winner of minor prizes, but never a first.

Eggert and Prichard cast with what is known here as the "rolling cast," the "water cast," "hoop-snake" cast, and in England as the "switch cast," used by Harry Prichard in his famous 91-foot cast in the tournament of 1882. The others retrieved their lines in the old style.

SINGLE-HANDED FLY-CASTING—EXPERT.

Judges: Dr. R. H. Kealhofer, T. B. Stewart, J. L. Vallotton, Referee. Open to all. Rods not to exceed 11 feet 6 inches in length. Distance only to count.

Name of Contestant.	Length of Rod.	Weight of Rod.	Distance Cast.
R. C. Leonard	11	9	92
Thomas Prichard	11.6	9	90
Thos. B. Mills	11.6	10¾	85
Geo Landman	11.6	10	83
Martin Culhane	11.6	9½	83
W. E. Hendrix	10.6	7¾	81
C. G. Levison	11.6	10¾	80
Ed. Eggert	11.6	10	78
W. H. Goodwin	11.6	9	65

In this contest the record was not only beaten one foot by Mr. Leonard, but it was conclusively shown that the height of a man and his muscle had little to do with the distance he could cast, and little Tom Prichard was the best evidence of this. We append the former records as published in the score book:

LIGHT ROD CONTESTS, 1882.

Class A, Rods to be 5¼ ounces or less—H. W. Hawes, rod 4½ ounces; distance 82 feet.

Class B, Rods not to exceed 4½ ounces—H. W. Hawes, rod 4½ ounces, distance 78 feet.

B. F. NICHOLS CONTEST, 1882.

All contestants to use the same rod, 10 feet, 6½ ounces—H. W. Hawes, distance 71 feet.

SINGLE-HANDED FLY-CASTING, AMATEUR.

Class A, 1882—H. W. Hawes, rod 11 6 feet, 9⅛ ounces, 81 feet (R. C. Leonard cast 85 feet, but failed on delicacy and accuracy).

Class A, 1883—H. C. Thorne, rod 11.6 feet, 8½ ounces, 80 feet.

Class B, 1882—R. C. Leonard, rod 11.6 feet, 10 ounces, 85 feet.

Class B, 1883—W. E. Hendrix, rod 11.6 feet, 10 ounces, 78 feet.

Class C, 1883—Thomas Prichard, rod 10 feet, 4¼ ounces, 80 feet 3 inches.

Class A, 1884—C. A. Rauch, rod 11.6 feet, 10 ounces, 80 feet.

Class B, 1884—Ed. Eggert, rod 11 feet, 7½ ounces, 75 feet.

SINGLE-HANDED FLY-CASTING, EXPERT.

Class C, 1882—Harry Prichard, rod 10.4½ feet, 8 ounces, 91 feet.

Class D, 1883—H. W. Hawes, rod 10.3 feet, 4⅞ ounces, 85 feet.

Class E, 1883—R. C. Leonard, rod 11.6 feet, 12 ounces, 87 feet.

Class D, 1884—H. W. Hawes, rod 10 feet 3 inches, 5 ounces (R. C. Leonard cast 78 feet with 5-ounce rod, but failed on delicacy and accuracy).

Class E, 1884—R. C. Leonard, 83 feet.

SALMON CASTING.

1882, open to all—H. W. Hawes, rod 20 feet, cast 116 feet.

1883, amateur—Ira Wood, rod 18.3 feet, cast 98 feet.

1883, expert—R. C. Leonard, rod 18 feet, 2 pounds 12 ounces, cast 124 feet.

1884, open to all—H. W. Hawes, rod 18 feet, 34 ounces, cast 131 feet.

MINNOW CASTING FOR BLACK BASS.

1884, open to all—Prof. A. M. Mayer, rod 8 feet 9¼ inches, 8½ ounces, 97 feet.

STRIPED BASS CASTING (LIGHT).

1882—J. E. Williamson, 2 casts, score 33 3-5.
1883—H. W. Hawes, 4 casts, score 100 4-5.
1884—H. W. Hawes, 5 casts, score 129 6-10.

STRIPED BASS CASTING (HEAVY).

1882—J. A. Roosevelt, 4 casts, score 127 1-5.
1883—J. A. Roosevelt, 5 casts, score 157 2-5.
1884—J. A. Roosevelt, 5 casts, score 204 feet 3 inches.

AUTUMN FISHING IN BARNEGAT BAY.

WHEN our two families planned to spend part of last month (October) by Barnegat Bay we had small hope of much fishing. Weakfish would be gone, and they are all that most persons expect to catch in the bay. Still, we hoped for a few sea bass and blackfish, and perhaps some striped bass. We also had some vague hopes of squidding some bluefish on the beach.

Our particular place of abode was Seaside Park. The Pennsylvania Railroad from Whiting's and Toms River to Long Branch here crosses the bay on a trestle bridge about a mile and a quarter long. A draw is made over the channel near the mainland side. Around the piling of this drawbridge we made our first regular trial of fishing. Our train went back in two hours, and we returned in it with about twenty-four fish, weighing in bulk twelve pounds. We called that very good luck. There was nothing very scientific about it; still, it required some knowledge to find the best places, and some skill to affix properly the crab bait, and constant vigilance to strike just as the bite was felt. Then the reeling up of the fish from the deep water was a pleasant operation, the fisherman meanwhile speculating as to the weight and kind. If the fish pulled with quick, strong jerks it would probably be a blackfish; if it ran here and there without much wriggle it would probably prove a sea bass; if it manifested a strong desire to seek the bottom, first in one direction, then in another, it probably was a porgy; if it struck off toward Barnegat Light or Bay Head, and showed no disposition to stop it might be a striped bass. Finally, when it pulled up like a young calf and wrapped the line around a pile, tied it up and broke it off, we never knew what it was but supposed it was a sheepshead.

And so we filled our creel nearly every day; sometimes it took us two hours, sometimes half a day. Sooner or later our luck always came, yet we caught no more than our families could eat. Our bait was pretty uniformly hard crabs. Mussels were not found anywhere near Seaside Park. Clams could not be found. A few minnows were used, and the sea bass and striped bass took them; but our main dependence lay in crabs. And just here let me put in a word of advice to any one intending to do fall fishing. Get a live-box for crabs, and stock it well when crabs are plenty, for on cool mornings they are always scarce, and may disappear entirely at any time. Several times we were told that the fishing was over now, for we could find no more crabs for bait; but we did, though with trouble sometimes. For a hook let me commend the Chestertown. It is the best thing known to keep a soft bait near to the point, and to hook the fish that bites.

We probably should have done better with striped bass, but the water was so constantly rough that we could not conveniently explore the best grounds in our small boat. The thing which promised best in appearance and turned out least in fact was squidding for bluefish from the beach. The fish came on shore only a few times, and then stayed but a little while. To a novice the throwing of the squid was a tiresome operation, and was very hard on the fingers. When one stopped to rest or to change location, then the fish began to bite. Even when they were evidently within range of our lines they preferred menhaden and weakfish to pewter squids. Once the great fish, six to eight pounders, fairly wallowed in the undertow, but none would hook themselves, though we wore away our finger ends with the sandy line. If we had had a spear or gig, or even a garden rake or a pitchfork, we could have dragged them out, they came so far up on the sand. The writer then and there resolved to cast the squid no more. Before he goes again he will learn to make long casts, and will either throw a weightier spoon or a genuine bait of fish. To play a six-pound bluefish through the surf and then land him amid the breakers would be about as fine sport as often falls to the angler's lot in our latitude.

PENN.

TAUTOG.

ABOUT the middle of September, 1884, I found myself at Brewerton, N. Y., on my way home from two weeks' voyaging on Lake Ontario, having passed several pleasant days among the Thousand Islands, where the crowds became larger and more dense, owing to the intensely hot weather—for autumn drew near only in the almanac—each day adding to the torrid condition of the atmosphere.

Brewerton nestles at the foot of Oneida Lake, a sheet of water covering an area of one hundred square miles, lying in Onondaga county mainly, and possessed of an enviable reputation for game fish, especially *Tautoga nigra*,* pike, pickerel and black bass. The lake is thirty miles long, about seven miles wide, and 369 feet above tide water. It derives its name from a confederation of Indians the etymology of whose title is "Tribe of the Granite Rock," and whose token was a stone set in a forked stick. Their origin is traced to the Mohawks, but they early became a portion of the Iriquois branch of the Six Nations. Their home was the fertile and extensive strip of country lying between Deep Spring, not far from "Salt Pint"—now known as Syracuse, twelve miles distant—and Utica. The lake was, of course, included in their possession, and from time immemorial has been haunted by that remnant of the tribe which remained in New York after the treaty of peace with the French in 1700. Throughout the Revolution they continued faithful to the colonists, as did also the Tuscaroras, although Thyendanega destroyed their homes and church and exiled them for a time. A treaty made at Fort Stanwix in October, 1784, confirmed their title, and in 1812 they once more evinced the gratitude and patriotism which animated them by espousing the cause of the States. There are, I believe, upward of 200 still residing on the reservations set apart for them when New York acquired their lands by purchase in 1785–8. These reservations cannot be sold and only partially leased.

The morning dawned with indications of atmospheric change. A few clouds hung motionless in the far southwest as I stepped out of my room ond surveyed the horizon, but not a breath of wind was stirring, and after breakfast we proceeded leisurely to the boathouse to get everything ready in time for the steamer, which was to give us a tow up the lake, if necessary.

At half-past eight, when I shipped the sculling oar and with a slow, steady motion sent the boat up stream to the marshes, where we "dropped a line" in hopes of getting a bite before nine o'clock, the hour aa which the little steamer would "catch our slack."

Just as the steamer poked her inquisitive bows around the island above us, the bunting at our masthead shook itself in the rising mist and waved itself suddenly out. A puff from the southward swept over the rustling sedge and brought with it a ripple and sparkle from the lake which filled our grateful hearts with exultation. Before the lines were stowed and trolling-spoons made fast to larger and longer lines, the breeze freshened so that we made sail at once and slipped away with alacrity. Once in the open lake a magnificent panorama spread itself before us. Away in the misty distance waved the tall green foliage of Frenchman's Island, still untouched by any visible tint of autumn, but nodding to us and flashing in the oblique rays of the sun as the waves tossed their white foam as far as the eye could discern their motion. To the northward a column of dense blue smoke streamed upward, and, bending sharply before the wind, spread itself over the low, leafless woods in that quarter until it blended with the sky and clouds indistinguishably. So busy was I observing all this that a fish took my hook without my knowledge, and before the eighty feet of line could be overhauled he was dead. It was a small pike, but the first fish for all that.

In a few minutes I had another, a large fine fellow this time, and he objected to the proceeding with such effect that we were compelled to heave to and drift back until I could bring him alongside. Lifting him in and dislodging the hook, which he had greedily swallowed, I felt a touch of his sharp teeth which drew blood on one of my knuckles. "First blood for you," said John, "but the first pickerel for me;" and stopping the slow, steady, alternate hauling and slacking of his line he began to lay it on the deck just aft of the mast in long, irregular coils which gleamed as they whipped clear of the water and shed the silver drops also. "That is not tautog though," he added as the fish leaped out of water ten feet from the boat and dove viciously. I suggested that we had been sailing too fast for them, but he preferred the exhilarating motion to the short tacks necessary for the larger game, and it was finally agreed that we would bear away toward Constantia, rounding the islands in time to make the South Bay House for dinner.

This new course gave us the wind abaft the quarter and the little boat cut the seething waves like a knife under jib and mainsail for a long straight mile. We did not time her and can only guess at the number of minutes required for the run. It was not many, however, as we caught only one fish, John's first pike, and had on new bait before I put the boat about and stood over toward the cat-tails north of Frenchman's Island. I was doubtful about there being water enough there, but John said it could not be less than three feet deep, so we stood on, and as we neared the long white beach several ladies and gentlemen walked briskly to the bluff from the hotel on the island, evidently expecting to see us ground in the channel, but the wind showed me where to steer by reason of being light, the island being to windward and only the deepest water rolled. We went through with a rush, and standing along the western shore, filled away for the bay, about two miles distant, which we made quickly, each taking a good-sized fish while yet some way out. We found other guests there, ten or twelve of them, sportsmen like ourselves, evidently from Syracuse and bent upon having a good time without getting intoxicated.

To fish for tautog successfully is not a difficult art. It is practiced in two ways, from an anchorage with hook and line on rods, or with long trolls, keeping the boat in motion most of the time, but stopping at short intervals to allow the hook to fall upon the bottom. This last was our plan, and to keep the boat in easy motion, heaving to on one tack and then on the other, necessitated the keeping of one hand upon the tiller all the while, with an eye to windward for the purpose of avoiding other boats. There were quite a number in our vicinity fishing like ourselves. The exception was a steam launch owned by the game constable, who saluted us as he passed. He was going swiftly through the water, apparently in pursuit of larger fish. Later in the day he passed within a quarter of a mile of us, having no less than eight or ten seines bunched up on the top of his awning. There are hordes of pot-fishermen infesting this beautiful sheet of water who repeatedly take the risk of losing their nets for the gain realized by their unlawful capture of fish. It is not unusual for the constable to be in serious danger, and many narrow escapes are rehearsed by the local boatman, who justly regard the game constable as one of their best friends. The nets are too expensive to be lost without a struggle, they often cost $100, and the venture is considerable to the average man. Were it not for these scamps two hours' fishing would give a sportsman all he could carry home any day. Although the wind was too high for a first-class catch we took a handsome string, and finally tiring of the sport, began to make sail for a run up the lake toward Oneida.

There is another island almost due south of Frenchman's, quite near the latter, somewhat smaller but possessing finer shores and magnificent timber. People are forbidden to go ashore there, and the almost primitive beauty of its contour is so effectually transfixed in my memory that I look back longingly to it even yet. If Cowper had been exiled to this island he would never have sung as he did of solitude; and even Byron might there have realized his dream of the ideal, the graceful curve "of stirring branches," the "popular solitude of bees and birds," the free spaces reaching skyward, limitless as air, that set a saddened spirit communing with the stars. These are a sportsman's fancies, and they lead us out of finite soundings in a moment. Like Theodidactus, in his asbestos boat, we can cruise on the sun with heliacal freedom, or swim the ether without any regard for the rules of philosophy.*

We hove to and set our canvas, but no sooner done than my line straightened out astonishingly, and seizing it I could feel the peculiar quiver which accompanies the hooking of large bass. Keeping the boat in the wind, I played the fish till he gave up. He was a fine fellow, three pounds at least, and was the only bass we captured that day.

John captured his fifth tautog a few minutes later, and remarking that we had fish enough for all of his neighbors, he coiled his line, changed the water in our bait pail to rinse it, allowing the little bait remaining to go adrift, and then settled himself to enjoy the long sail we had promised ourselves.

The rowboats were coming and going in the bay with their long trolling lines stretching far behind them. We were just rounding the point when a rowboat with two men on board drew near us, and suddenly the fellow in the stern sheets jumped to his feet and sang out, "I've got him now!" He was so much under the influence of "fever" that he did not play his catch at all, but hauled in, hand over hand, so rapidly that the line went scooting off one way then the other, and once I thought I caught a glimpse of a large black fin, while John coolly remarked: "It's an old blackfish, I guess." Knowing that to be another name for tautog and being aware that they sometimes attain the size of a small whale, to which species one class of them belong, I ranged alongside in order to get a good view of the fish. John asked the fellow if he had a landing net, but the latter was too far gone to hear and we could only enjoy the fun by keeping still and watching the line as it zipped about, while the boat careened and dove until everything in her threatened to go overboard in spite of the rower, who feathered and shifted his weight with admirable dexterity. All at once with the rapidity of lightning, the straining line showed more and more of its rigid length and John called: "Look out, now, he's going to give you the dirty shake!" In a second the breach occurred. The water recoiled, flashed and broke as something black leaped two or three feet into the air and fell flat upon the surface, while the man at the opposite end of the line tumbled backward into the bottom of his boat, showing his boots above the gunwale an instant with a groan. "He is hurt!" said I. John laid his hand cautiously on the mast and deliberately getting on his feet, looked at the floating object with a curious grin. In a moment we ran near enough to see that it was a strip of board, and the hook, as it dropped, had caught in a small knot-hole so near the middle that an eager pull to fasten the hook had done it and set the thing on edge defiantly.

The tears rolled down John's cheeks as I trimmed down, and several minutes passed before either of us could articulate a word. John got his breath first and whispered "tautog."

EGO.

* *Tautoga nigra* is a salt-water fish. We are at a loss to know what fish they miscall "tautog" in Brewerton.

* Kirchner's "Extatic Journey to Heaven." There are many poetical fancies in this work. The planet Venus is described as an island of transcendent beauty, peopled with angels.

THE TIM POND COUNTRY.

IT was my eighth annual trip to Tim Pond, Maine. I left Boston the 5th of August. The Farmington & Megantic Railroad has given a new impetus to Kingfield. Smith has very much enlarged and improved his house. We found the trouting at Tim Pond just about as it was in 1878, better than in 1881. The very large number of sportsmen that visit this most famous pond do not deplete the fish as did the natives when they were accustomed to take them by the basketful from their spawning beds before the protection by law. Never did I see finer fly-fishing in August than I enjoyed here last month. We went from Tim Pond to the Seven Ponds on horseback. The fly-fishing on L Pond was fairly good. On Big Island Pond trout did not rise well to the fly, but could be caught of large size in its deep water with bait. At Rock and No'west ponds fly-fishing was excellent for the season. These ponds have not deep water. Taken the season round Tim Pond is the "daisy" of all in this region—or the region of the Rangeleys which have been damaged for years to come by high dams and broken ones—though this may protect the trout for future generations.

Detectives under Com. Stilwell have been at work about the Rangeley and Seven Pond waters to mete out justice to the law-breakers. You may have heard that a man by the name of Soule, after his pocket had become minus forty dollars for shooting a deer, used his shotgun as the detectives appeared in his vicinity a second time. Recently another of the tribe of Soule, doing his nefarious work of poaching on the shores of Big Island Pond, I am informed has enriched the State Treasury. These "guides" or keepers of outpost cabins in lone shadowy places are learning to have fear and respect for the majesty of the game laws. May their vile work and the big slaughters end soon.

Aug. 22 we returned to Mount Vernon to spend a week with the black bass. I had grand outdoor sport, but the weather and the moon were against me. I landed a moderate number of fair size, but my hopes were not fully realized. The great chain of ponds through Monmouth, Winthrop, Maranacook, Readfield, Mount Vernon and Belgrade are well stocked with this gamy fish, and in these clear waters their meat is most excellent for the epicure. I spent my time on Long Pond. Mr. Stilwell thinks Cahbosecontee was stocked first and has some monster black bass. There is good fishing for white perch in this chain of ponds.

During the past year your correspondents have taught me much about snelling hooks, and I have spent time in experiments and practice in the art. The result is, in all my deep water bait trouting and all my black bass fighting I did not lose a hook from fault of "tying." I do not care a fig for the loss of fifty hooks, but I care much for the loss of the "big fish." I took Dobson with me, but I am not sure the bass had ever been introduced to one before. I am sure the native sportsmen had never seen one till those I took. Give us more light about these fish that are locked up in ice four, five or six months a year. Much has been written of black bass in the Middle and Southern States. We need more light about their ways in the colder climate.

Aug. 31 I unstrung my rods, cleaned and dried my tackle and put it in the attic till another year. Sept. 1 I returned to business, a happier, heartier, healthier man. J. W. T.

THE ICHTHYOPHAGOUS DINNER.

ABOUT seventy staid and solid-looking gentlemen sat down to dinner at the Buckingham Hotel on the evening of Wednesday, Oct. 21. To a stranger's eye there was no indication that in the long array of claw-hammer coats and expansive shirt-fronts of the well-groomed diners that any among them had spent the day in the rain and slush at the fly-casting tournament, and only a few hours before had been drenched to the skin. They had met to again sample the uncatable, and in many cases unspeakable, monsters of the deeps and shallows, and while on their invitations they made a jest of indigestion, it was evident that all hastily read the bill of fare with anxiety; for up to the moment of taking their allotted seats no one but the committee had the slightest idea of its contents. The President, Mr. John Foord, with his gavel of walrus bone, sat at the head of the table, while the committee, consisting of Messrs. E. G. Blackford, Francis Endicott, Fred Mather, C. R. Miller and James De Mott, were scattered about. Among the guests we noticed Judge Reeder, of Harrisburg, Pa.; J. S. Van Cleef, Cornelius Van Brunt, Adolph L. Sanger, President of the Board of Aldermen; Dr. E. C. Spitzka, A. De Cordova, Nathaniel Hunting, proprietor of the Murray Hill Hotel; Gordon L. Ford, Gilbert E. Jones, Henry L. Dyer, Amos Robbins, R. B. Roosevelt, Howard Carroll, F. B. Thurber, A. E. Whyland, Louis Liebman, Jules Turcas, G. Wetherbee, proprietor of the Windsor Hotel, and B. F. Nichols.

The tables were decorated with pyramids of horsefoot crabs, lobsters and crayfish, twined with smilax. The following is the menu:

Blue Points.
Vin de Graves.
Extract of Razor Clams.
Bisque of Starfish.
Royal Sherry.
Radishes. Celery. Olives.
Squid, fried (Chondopterygien).
Winkles, Burgundy fashion.
Sea Spider Crab à l'infernal.
Crayfish du Potomac.
Liebfrauenmilch.
Cucumbers. Hollandaise Potatoes.
Skate, Cream Sauce (Acandopterygien).
Crevalle à la Marseillaise.
Sea Robins, Baked à l'Amphitrite.
Salmon (Royal Fish), Parisian Style.
Buisson of Lobster, Tartare Sauce.
Pontet Canet.
Filet of Beef.
Mushrooms and Tomatoes Farcies. French Peas.
Stewed Terrapin, Buckingham Style.
Ichthyophagous Punch.
Broiled Teal Duck.
Lobster Salad. Crab Salad. Lettuce Salad.
G. H. Mumm's Cordon Rouge.
Neapolitan Ice Cream. Fruit Jelly. Assorted Cakes.
Fancy Pyramide. Fruit. Cheese.
Café. Liqueurs.

The novelties were the starfish, winkles, sea-spiders, and crevalles. The latter is an ordinary looking fish and attracted no attention. The spider crabs were devilled and served in the back shell and were quite good, although their repulsive appearance when alive will long forbid their coming into common use. The winkles were, as they always are, tough and unpalatable and were, if not the *pièce de résistance*, the joke of the evening. The bisque of starfish was quite good, and if this enemy of the oyster can be made popular as food it will be a good thing for the oystermen.

Letters of regret were read from Henry Ward Beecher, Charles A. Dana, Amos Cummings, Dr. W. A. Hammond and M. P. Handy. In evident agony the president announced that as a gastronomic delicacy the winkle was a failure, and called on Mr. Roosevelt to explain how he came to recommend it to the club. The latter gentleman, fully conscious of his guilt, wandered off into a description of the beautiful manner in which the winkle lays its eggs, and enhanced on the merit of the winkle for fish bait because it was too tough to be nibbled off, and acknowledged that he had tried to eat it in former years but had skipped it tonight, and tried to throw the responsibility of the winkle on Mr. Blackford. Howard Carroll, Judge Reeder and others argued about the relations of the winkle to nightmare, and Amos Robbins and Fred Mather opened bags of "chestnuts" and put the party to sleep before Dr. Spitzka could speak on the forms of insanity caused by eating the roystering winkle.

THE ROD AND REEL ASSOCIATION.—At a meeting held by the National Rod and Reel Association after the tournament the following officers were elected for 1886: President, Hon. Henry P. McGown; Secretary, Mr. Fred Mather, Cold Spring Harbor, N. Y.; Treasurer, Mr. James L. Vallotton. Before the election Mr. Mather positively declined to accept the secretaryship longer, on account of the press of work; but the members refused to listen to him, and it is very doubtful if it will be possible for him to serve. The meeting adjourned subject to the call of the President.

TWO BASS AT ONCE.—Kansas City, Mo., Oct. 19.—In your issue of Oct. 15 I see your notice of Mr. Leopold's and Mr. Frank Sherman's double catches. July 12, at Detroit Lake, Minnesota, on a light bass rod and an 0206 Abbey & Imbrie reel, I took two small-mouth black bass, one on a minnow and one on a crawfish. Length of each 17½ inches, and weight twelve hours after taken from the water, 3 pounds each.—F. M. O.

THREE TO EACH ROD.—"M. W." asks if the location of the "Parmachenee Belle" had anything to do with the trout showing a preference. I found this fly the most taking in June below the Upper Dam no matter where it was placed on the cast, above or below. Had Messrs. Allen and Maxson used four of the above flies they might have beaten the record.—WILD.

SEBAGO LANDLOCKED SALMON.—Salmon are just beginning to run up the brooks in the waters of Sebago Lake. I saw three handsome fellows on the 19th inst. in a weir in Rogers Brook, North Bridgton, Me. They are being secured to procure their eggs for artificial propagation under the auspices of our Fish Commissioners. This is a new enterprise. The Fish Club of Bridgton Center are building a hatching house, and Mr. John Mead, the fish painter, and Mr. Frank Gibbs, of Bridgton, are securing the salmon at Rogers and Bear brooks. Last year the salmon began to run up those brooks on Oct 25, this year they seem to start earlier. Our Commissioners think by hatching fifty or one hundred thousand every year they can very much increase the supply of these beautiful fish in these waters. In Crooked River, which runs into Sebago Lake, there are now running up a large school of landlocked salmon. By protecting these fish in their spawning season and turning in yearly a large amount of fry, there is no doubt that they will increase continually and give fine sport to anglers who may visit these beautiful waters.—I. G. R. (Bethel, Me.).

Fisheulture.

Address all communications to the Forest and Stream Publishing Co.

SEBAGO SALMON PLANTING.

Editor Forest and Stream:

The following special was published in the Boston *Herald* of Saturday evening, and I have added some facts to it which I trust will be of interest. The people of Maine are slowly waking up to the value of fish propagation. But still much has to be done by private enterprise, as in the case below. The State allows only about $7,000, I believe, for the entire work of the fish and game commission.

BRIDGTON, Me., Oct. 24, 1885.—There is a live movement in the direction of fisheulture on some of the tributaries of Long Lake, one of the Sebago chain. For some time this matter has been of interest to fishermen in these parts; and lately Mr. Frank Gibbs, of Bridgton, has begun the work in earnest. His first move was to get a permit from the Maine Fish Commission to take salmon for breeding purposes. Having obtained this he next put in weirs in Rodger's Brook, the stream where the monster land-locked salmon were found, of which the *Herald* has had previous account. By these weirs the salmon, as they pass up the stream to breed, would be detained, but still allowed plenty of room and water. The same is to be done in Bear Brook, at the head of the lake, in Harrison. The weirs were put into Rodger's Brook about a week ago, but although there were an abundance of large fish lying on the sandbar just off the mouth of the river, still the weir was empty for several days. Within the last four days the fish have begun to come up the stream, and to-day there are at least a dozen in the weir. These are all fish of a good size, and one of them weighs at least 12 pounds; it is 23 inches in length. As it is quite early for salmon to enter these streams, those most interested are sanguine of all the fish they can for before the run is over. The poaching and wholesale slaughter of these fish in spawning time, that has been carried on in former years, is effectually squelched. Just off the bank of the stream opposite the weir is a white tent, and a more substantial building is going up near it. The principal occupant of this establishment is Mr. Rich, a son of J. G. Rich, the veteran trapper and guide of the Rangeley region in years gone by. Mr. R. says he has "come there to stay," and that there "will be no fish for poachers on that stream this season at least."

In the above mentioned streams may be seen every fall one of the peculiar features of the breeding of salmon. Rodger's Brook is a little stream carrying only a few inches in depth of water and so small that a man can jump across it at almost any point. And yet at the breeding season the monster salmon work their way up this little stream, often with back fin and caudal out of water and belly dragging upon the pebbly bottom. The writer saw one of these in November, 1883, which was twenty-four inches long and must have weighed eight pounds. A few days after a monster salmon was found near the waters of the same brook stranded and dead. It measured 38in. in length, 9in. in depth, and weighed 25lbs. It was a male fish and the hooked under jaw was so prominent that it was hung over a stick by that means and brought to the village. It is an established fact that the salmon accept of this little stream for a breeding-place in lieu of a larger one, running up into it, as the season comes on, the same as the sea salmon accept of the large rivers.

In these brooks the salmon have for years been the prey of the most detestable poaching, until this was broken up by the efforts of the Maine Fish Commissioners. The salmon have been watched and even thrown out of the brooks with pitchforks and left to rot or carted off and salted down. In such streams so large fish are utterly powerless and suffer severely from minks and owls, as well as poachers. The fish seen by the writer in 1883 had the back fin stripped, evidently by teeth or claws, and the upper half of the caudal fin was gone, doubtless bitten off. Yet this fish, a female, was alive; had evidently spawned, and was on her way back to the lake below. A few days previous, a bird dog, in quest of partridges, killed a large salmon in the same brook.

Last year some public-spirited gentleman, one of them the correspondent who wrote the above for the *Herald*, took some large salmon, which had evidently bred, placed them in a tank of water and carried them back to the lake. They obtained permission of Fish and Game Warden Mead, of Bridgton, to do this, being fully convinced that the fish would never get back alive, running the gauntlet of so many dangers. It is gratifying to learn that so good a movement is on foot for the preservation and breeding of these noble fish. It will be remembered that the Sebago waters have contained landlocked salmon for time immemorial, and that these there reach a size almost equal to the true *Salmo salar*. Indeed it has been suggested that the Sebago Lake was once an arm of the sea. As it is today, it is a small lake, within easy distance by rail from Portland, and the home of the most noble landlocked salmon in the world. Its shores are chiefly wooded and designed some day to be dotted with summer cottages.

A hatching house is in progress of completion in the basement of the Littlefield mill at Bridgton Center. As soon as a sufficient number of ripe fish are on hand, Commissioner Stanley is to be here to assist in the taking of the eggs. The fish, after the eggs are taken, will be returned to the lake, and the eggs will be taken to the hatching house. The commissioners will also furnish 80,000 eggs of sea salmon to this hatchery to be cared for at the expense of the commission. After the young fish are through with the hatching process and able to take care of themselves, they are nearly all to be returned to these waters. It is confidently expected that this movement will work a great change for the better, as far as the salmon fishing in these waters is concerned. The commissioners of Maine and other States agree that by the natural process of hatching, not over five per cent. of the eggs of salmon come to perfection. They are the prey of other fish and of accident to such an extent that the few that come to maturity are a small exception. On the other hand the commissioners claim that by the artificial process as high as 90 per cent. of the eggs have been made to develop into perfect fish. If this is so, and it is stated on the highest authority, the public can hardly put too high an estimate on a work such as that which the parties mentioned have undertaken. A hundred thousand young salmon placed each year in the streams that flow into the streams of Long Lake would, without doubt, work a revolution in the fishing in the Sebago waters, and that is just what he gentlemen interested are determined to do. SPECIAL.

CONNECTICUT FISH COMMISSION.—The Commission has, during the past seven months, hatched and planted 5,733,000 young shad, and has distributed 450,000. To 150 applicants 45,000 young trout have been distributed. The Commission has hatched 100,000 salmon eggs that were furnished to the State by Prof. S. F. Baird, and placed the young fry in the Farmington River. It has, in addition, hatched 30,000 Michigan trout eggs presented by Prof. Baird, and placed them in streams in Hartford county. The number of shad hatched were distributed as follows: In the Connecticut River, 2,254,000; in the Housatonic, 1,969,800; in the Thames, 882,030, and in the Quinnipiac, 627,200.

SOLES FOR AMERICA.—Five hundred soles are expected to arrive next Monday as a present to the U. S. Fish Commission from the National Fisheulture Association of England. Prof. Baird telegraphs to Mr. Blackford that the fish will be sent to Wood's Holl in charge of Mr. Mather. If they arrive in good order they will be kept at Wood's Holl and fed until large enough to spawn.

CARP FOR DISTRIBUTION.—Mr. E. G. Blackford, of Fulton Market, New York, has just received 5,000 young carp for distribution in New York and neighboring States from the U. S. Fish Commission. The fish are from three to four inches long, and will be distributed in lots of twenty to applicants.

THE WASHINGTON TERRITORY COMMISSION.—We have just received word that this Commission, which was supposed to have been abolished, is still in existence. The Commissioner is Mr. Albert T. Stream of North Cove, Pacific county.

FIXTURES.

BENCH SHOWS.

Dec. 15, 16, 17 and 18.—First Annual Dog Show of the Western Connecticut Poultry, Pigeon and Pet Stock Association. Frank D. Hallet, Superintendent, Winsted, Conn.

April 6, 7, 8 and 9, 1886.—Second Annual Dog Show of the New England Kennel Club. Jean Grosvenor, Secretary, Boston, Mass.

FIELD TRIALS.

Nov 9.—Second Annual Field Trials of the Fisher's Island Club, for members only. Max Wenzel, Secretary, Hoboken, N. J.

Nov. 9.—First Annual Trials of the Western Field Trials Association, at Abilene, Kan. Entries close Oct. 15. A. A. Whipple, Secretary, Kansas City, Mo.

Nov. 12.—New Jersey Kennel and Field Trials Club. Field trials for members only at Fisher's Island. A. P. Vredenburgh, Secretary, Bergen Point, N. J.

Nov. 16, 1885.—Seventh Annual Field Trials of the Eastern Field Trials Club, High Point, N. C. Entries for All-Aged Stakes close Nov. 1. W. A. Coster, Secretary, Flatbush, L. I.

Nov. 17, 18 and 19.—Second Annual Field Trials of the Philadelphia Kennel Club at Rio Grande, N. J., for members only. Entries close Nov. 1.

November.—Fourth Annual Trials of the Robins Island Club, Robins Island, L. I., for members only. Wm. H. Force, Secretary.

Dec. 7.—Seventh Annual Field Trials of the National Field Trials Club, Grand Junction, Tenn. Entries for Derby close April 1. B. M. Stephenson, La Grange, Tenn., Secretary.

A. K. R.—SPECIAL NOTICE.

THE AMERICAN KENNEL REGISTER, for the registration of pedigrees, etc. (with prize lists of all shows and trials), is published every month. Entries close on the 1st. Should be in early. Entry blanks sent on receipt of stamped and addressed envelope. Registration fee (50 cents) must accompany each entry. No entries inserted unless paid in advance. Yearly subscription $1.50. Address "American Kennel Register," P. O. Box 2832, New York. Number of entries already printed **2794.**

THE COLLIE FRAUD AT PHILADELPHIA.

Editor Forest and Stream:

In your last week's issue you gave a correct account of the collie kennel prize controversy, and in the article state that "it was the duty of the judge to have seen every dog entered, and this would have effectually blocked the little game," which is all true; but, as you also state, "both owners assented," and it being a matter that only directly concerned them, and not supposing that a member of the club, and an M.D. would stoop to win a dog prize by intentional deception, it seemed unnecessary to take the animals down again into the passage-way between the benches, which was the only place I had to judge them. I called from the catalogue the entries of both contestants, to the steward, who had the book showing which dogs had been before me in the regular classes, and he informed me the awards of any that each had received. It was his duty to have notified me then that No. 85, So So, was not checked as present. Probably he did not notice it, and like myself, thought the Sans Souci Kennel was represented by an honorable gentleman, and so was not so careful as he otherwise would have been.

With my experience and acquaintance with such collie exhibitors as Messrs. Dennis, Faxon, Burgess, Lindsay and others, whose dogs have been before me, I was not on the lookout for any fraud between those I supposed were gentlemen. I know neither of those I have just mentioned, under the same circumstance, would have allowed me to look up the entries before saying they could not compete for that special, while this *sans souci* gentleman not only deceived me at the show, but deliberately wrote to me a week after that "So So was not absent, but sick," as extracts from correspondence with Dr. Hext M. Perry will show. Oct. 12 he wrote:

I inclose slip cut from *Sporting Life* of this date. Will you please read and give me your opinion of same? I wish your special opinion as to following: "Mr. Perry said there was no necessity to show the dogs, as he had won so many more prizes." I hope you will give me your strongest denial of the assertion. I ask it for my personal satisfaction and in case of necessity to show to any friends that may wish to see it.

This was the first intimation I received that No. 85 (So So) was not in her place, and possibly I might not have seen her. I at once replied:

This is certainly incorrect, as it was I who suggested that it was unnecessary to take the dogs from the benches again, as the awards in the regular classes would decide the special, and you and Mr. Lindsay being present and making no objection, the judge's book was referred to and showed that your kennel, consisting of Ben Nevis, Mavis, Wanda, Daisy and So So, had won two firsts, one second and one third, while Mr. Lindsay's kennel, consisting of Rex, Craft, Joe Nettles, Jeannie Nettles, Gem and Portland, had won one second, one third and a commendation; and of course, not being informed that any of the animals entered for the special were absent, your kennel won. I am surprised that I was not told at the time that So So was absent.

I wrote the last paragraph with some reluctance, believing there must be some mistake, and that So So was there as represented, but desired to draw out some explanation from Dr. Perry. This reply came promptly, dated Oct. 13, as follows:

Yours in reply to mine of yesterday's date is to hand.

I beg leave to state that So So was not absent but sick, and I think I am going to lose her. She was too sick to stand up and every movement gave pain. My man was nursing and doctoring her all day, and she remained at the show till Friday, Oct. 9, 9 P. M., with the others of her kennel. The veterinary examined her and gave me a certificate, etc., to remove her, but on account of the muss made by my enemies I would not remove her even at the risk of death in not doing so.

After reading the foregoing, I naturally supposed Dr. Perry would be able to submit any proof necessary to enable the committee to confirm the award to the Sans Souci Kennels. On the 15th inst., however, I received a letter from the secretary of the club asking for my recollections regarding the judging for the Kennel Special, and he "hoped I might be able to throw some light on the subject in question, as to the entry of No. 85." I replied, giving him what information I possessed concerning it, and added: "If Sans Souci Kennels had but four dogs there when I judged, of course Lindsay, with his kennel, should have won; and if there has been any misrepresentation, my decision should be reversed, and it will please me to have it done."

I heard nothing more of the affair till Oct. 22, when I received the following letter:

PHILADELPHIA KENNEL CLUB, Oct. 21, 1885.

Mr. A. S. Apgar, New York:

DEAR SIR—Your kind letter was duly received by me. I am sorry, indeed, that any question should have arisen about the judging in your classes, and we wanted all the evidence we could get before taking any decided steps: and now, at this late day, Dr. Perry comes forward and says No. 85, So So, was not at the show at all when the judging was being done: that the judge (yourself) did not see her.

We look upon it that Dr. Perry deceived you, leading you to believe his bitch was present, by not saying differently when you called the numbers over in making the kennel award.

Our committee met last evening, and from Perry's acknowledgment of only having four dogs in the show we decided to give the kennel prize to Mr. Lindsay's kennel, as it could not be won by less than five dogs.

Our club feel deeply chagrined to think one of our members would attempt to practice such business both upon you and upon an exhibitor.

I was sorry not to have met you when you were here, and that we should have had so unpleasant weather.

I trust our action in regard to this Kennel prize may have your approval. Very respectfully, E. COMFORT, Sec'y.

Further comment seems unnecessary, except to state that the action of the committee does meet with my unqualified approbation. A. S. APGAR.

NEW YORK, Oct. 27, 1885.

Editor Forest and Stream:

In commenting upon the collie kennel protest at the Philadelphia Kennel Club's late show, in the course of your remarks you say: "The club took nearly two weeks instead of five minutes to consider the matter," thus implying that the delay of action in the matter could have been avoided. Mr. Lindsay's protest was sustained as soon as a special meeting to consider the subject could be called instead of having the matter lie over until next stated meeting of the club during first week of November. Never was it intended by the committee that aught but justice should be given. Your comments, whether intentionally or not, convey the idea that the committee's action was purposely delayed. A MEMBER.

[Nobody but a highly organized idiot, in good and regular standing, would have drawn any such inference from the comments in question.]

THE BLACK AND TAN COLLIES.

Editor Forest and Stream:

About a month ago I wrote a letter advocating the division of collies into two classes, making a separate one for the black and tan. You kindly gave my article place in your columns. At the same time I wrote a letter to the *A. K. R.* In the October number I find the following: "B. A. R. O. If the black and tan collies are good enough they can win. The trouble is there are very few good ones, and that being the case we cannot advocate a distinction by color which would place them on a par with better dogs. * * * All collies are judged by the same standard," etc.

The editor of the *A. K. R.* says truly there are very few good black and tans. But why is this so? Simply because they have been bred indiscriminately with dogs of all colors, and so have in such cases lost those distinctions, which are not only their chief beauty, but which are sufficiently marked to distinguish them from other colors of collies.

Now, what do we breed for, that is supposing we breed intelligently? The main point, I take it, is to keep the strain pure. For this reason we register our dogs, stud visits and produce, simply that we may know that a dog called a collie is a collie. Next we should breed for beauty. And the only way to do this is to perpetuate prominently beautiful features. There is one beauty mark about a black and tan collie which will not be found on any other dog (unless the strain has been crossed with the black and tan). He has a tan chest. Beginning at each shoulder is a frill (formed by the hair on the chest and body growing in opposite directions, thus forming a curl at the line of meeting), this frill on each side extends down in a slant, meeting at the center of the chest, just low enough down so that when the dog lowers his head the point of the frill or curled line is just below his chin, and in that position looks very pretty as a frame to the face. And the collie often holds his head so when sitting.

Now I claim that when a strain of black and tan collies has been kept pure every pup will be black and tan and will have this and other beauty marks (spots over the eye, tan stockings, etc.) peculiar to the black and tan.

If I can show that something is gained by keeping this collie away from other colors, and it cannot be shown that anything is gained by mixing, is not my position well taken that it would be well to breed separately? For practical purposes is the collie less useful because he is black and tan? Certainly not. Then why not perpetuate him? If the *A. K. R.* editor is correct, as he undoubtedly is, that good black and tan collies are scarce, does not that prove that we are gradually wiping out a beautiful animal? And how can it be better helped than by making a separate class of him? As long as the tawny dog takes the prizes he is bound to be the stud dog; and owners will send their females to the champion regardless of the color of their own females. But make a separate class, and give us a few black and tan champion stud dogs, and we will remove the temptation to breed across in color. In nature generally do we not expect the young to resemble the mother? But if a black and tan bitch has a tawny father how can we expect a litter all one color? And does it look like natural or intelligent breeding to see sisters and brothers all different? In *A. K. R.* for October we see in the "Produce Register": "Collies. Beauty III.—Ben Nevis.—Mr. W. S. Powers's Beauty III. (A.K.R. 2598) whelped eight, two sable dogs, two black and tan dogs, one white and black dog, one sable bitch, one white and black bitch, one white with black and sable markings." With any other dog but the unfortunate collie such a result would be laughed at. This is a good instance of what I asserted above. Mr. Powers sent Beauty III., a black and tan, to Ben Nevis, a sable dog, because of the stud dog's reputation; and of course under the present rules such breeding is right enough, only it is one more blow at black and tan stock. And it does not seem to me to be beneficial breeding, because the progeny is not as good as either parent, for this reason: Ben Nevis bred to a sable bitch would probably throw sable puppies, and Beauty III. (if true black and tan bred) would throw black and tan to a black and tan dog. In other words, you could guess the progeny by the parents. But who would try to guess at the progeny of any of these puppies? But again I say under the present rules Mr. Powers was right to use the best known stud dog he could find.

Now let me show you how the black and tan can be bred. Some years ago Mr. C. F. Thompson of Wadley's Falls,

imported a pair of black and tan collies, Lord Lorne and Nancy. Nancy unfortunately died about a month ago. These dogs were bred together again and again, and every pup was black and tan. The last litter was 6 males and 4 females, all black and tan. These 4 females were named Lui, Spunk, Gipsey and Lady Lola (A.K.R. 2714). Spunk he kept himself and bred to Lord Lorne, her father. She threw 10—6 males and 4 females—all black and tan. Lui was bred to his Gaffa III., result, 10—8 males and 2 females, all black and tan; Gipsey to a dog owned by purchaser, result, 9 black and tans, 7 males, 2 females; Lady Lola I bought and bred to Los (Tam O'Shanter stock) result, 8, 7 males, 1 female, 7 black and tan, 1 black and tan with white ring around neck. To recapitulate on the last breeding, Nancy to Lord Lorne, 10 black and tan, 4 bitches; the 4 bitches to black and tan dogs, threw 37 pups, 36 black and tan, and of the 37, 28 were males.

This then is what I mean by intelligent breeding. When I bought Lady Lola I saw her three sisters. I arranged to get their records when bred. I have just received it. Therefore I attribute the white-ringed pup in my litter to the sire, and therefore Los is for sale or to give away if need be. Why? Because I will not use him again with Lady Lola, nor would I with my sable bitches, therefore he is of no use to me. Now I want to replace him. If there were some champion black and tans in the stud I could easily send my bitch to be served and afterward use her get with her, but as the black and tan is run down in this country I can only experiment.

And so I claim that the division into a separate class would do much to improve the black and tan, and the others too, as it would help to make breeding true to color all round more possible. I hope some other breeders will express themselves in this matter, so that I may not be entirely alone.

B. A. R. OTTOLENGUI.

Brooklyn, N. Y.

FRAUDULENT PEDIGREES.

Editor Forest and Stream:

Having read in FOREST AND STREAM of Oct 1 Mr. Dilley's article on the pedigree of the pointer bitch Fancy, and his remarks regarding my action in the matter, I will say that Fancy was shipped to me the fore part of July last, represented as by Croxteth, ex Royal Fan. I was well acquainted with Croxteth, but knew nothing of Royal Fan; so wrote to Mr. Godeffroy asking him for pedigree. On receipt of his reply referring me to Mr. W. A. Coster and Mr. Dilley I wrote to both of these gentlemen; and now, in order to show those interested how near Mr. Dilley came to the truth when he stated that he replied to my letter, informing me of the bitch's false pedigree, I ask you to publish his reply, also Mr. Godeffroy's, and the reply to my letter written to Mr. Coster, which constitutes the entire correspondence.

Mr. Dilley pronounces my understanding badly off and my memory treacherous. I think if you read these letters carefully you will agree with me that my understanding was good and my memory far ahead of Mr. Dilley's. After hearing that Mr. Dilley had written the purchaser of the bitch that I had sold her knowing her pedigree to be false—as he had replied to my inquiry telling me so—I wrote to Mr. Dilley, telling him the contents of his reply to my inquiry and asking him in a very friendly way to apologize for his statement. And now see, rather than be fair and honest in the matter, he answers me with this postal card; and I again ask those interested if it seems at all reasonable that after Mr. Dilley had replied to my inquiry on the 27th about the bitch, asking me to forward full particulars, etc., that he should without waiting for my reply sit down again the very next day—the 28th—and write me again, and this time tell me that the bitch's pedigree was false? Fancy's pedigree may be false, but when Mr. Dilley states that he wrote me informing me of it, I can only say that I did not receive the letter. C. E. LEWIS.

Collingwood, Ont., Oct. 9.

[So far as we can judge from reading the letters referred to by Mr. Lewis, the only mistake in the whole business arose from a misunderstanding as to the identity of the bitch Fancy. Mr. Lewis took it for granted that she was by Croxteth and out of Royal Fan and wrote to Messrs. Dilley, Godeffroy and Coster for the pedigree of her dam with no explanation as to the claim that Fancy was so bred. All of the gentlemen appear to have written Mr. Lewis without any reference to this claim. Mr. Dilley says that he wrote to Mr. Lewis the next day and told him that Fancy was not bred as was claimed, unless she was Cora C. Mr. Lewis says he did not receive this postal; this appears to be all of the misunderstanding between these gentlemen. Had Mr. Lewis exercised the ordinary care common in all business transactions, he would not have been deceived in the purchase of Fancy. There is no excuse for Mr. Miller in selling Fancy with a pedigree that has been plainly proven to be false. Moral—Buy a dog as you would a house and lot and save the columns of the FOREST AND STREAM the unpleasant duty of exposing fraudulent dog sales.]

BEAGLE RECORDS.

Editor Forest and Stream:

As a matter of importance to owners and breeders of beagles, also to the members of our Beagle Club, I wish to ask for their opinions, through your paper, in regard to the keeping of a perfect record of their hounds both as regards pedigree and winnings at bench shows, as it is the only way in which the breed can be kept pure and purchasers protected from dog dealers, who only love any breed for the clear money they can make out of them. I think too much care cannot be taken by owners in entering their beagles properly at all our shows, as a mistake in doing so may become a serious matter should dogs so entered win a prize, as it then becomes a matter of public record. I am of the opinion that winnings and the show at which they were awarded should be entered in the catalogue of all shows at which a beagle is exhibited for competition, as then it cannot become a matter of doubt whether the dog did or not win, as the following case will show: Mr. Dan O'Shea entered at Philadelphia, in September, 1885, a beagle called Kino, white, black and tan, age two years, imported. Now, in the first place, the dog was much older, and in the second, he never was imported. I ask Mr. O'Shea for the proofs, for I learn from good authority the dog was purchased in Michigan. Again, in October, 1885, Mr. O'Shea entered a beagle dog, Rattler, in the champion class at Philadelphia and stated that he was the winner of twenty first and second prizes. Now, as he owned several Rattlers, I want to know where this dog won all his prizes. He also entered a bitch called Mischief, age two years, at the same show and states that she is the winner of first and second prizes. I ask where, as he owns three by that name, and it is not the one entered at Philadelphia in May, 1885, which took first, as the sire and dam are both different, also their ages. Now, I claim if beagle owners, breeders and exhibitors are working to make the beagle a success, they cannot be (in connection with a perfect record) too careful about having one name for almost all their dogs. If an owner must do so, let him add Nos. 1, 2, 3, 4, 5 and so on to their names. But don't put No. 2 up in the class if No. 1 dies. The proper way is to have No. 2 remain so, as that will not confuse those who own stock out of or by such a number. I am not making this a personal matter, only I have an interest in having beagle matters straight, if possible.

I must not let this opportunity pass without thanking you again for the interest you have at all times taken in the beagle and the club. It is largely through your help we are advancing the breed. I am much pleased with your report on the beagles and the judging at the show held at Philadelphia this month. It is complete and full, good and correct. Let the good work continue. A MEMBER OF THE BEAGLE CLUB.

THE ROBINS ISLAND FIELD TRIALS.

THE fourth annual field trials of the Robins Island Club, to be run on Robins Island, Nov. 4, promise to be the most interesting yet held. So far as I can learn the dogs entered are well up in their work, and the winner will have no easy task. Birds are very plenty and well grown, and the grounds are all that any one could wish. The gentlemen selected as judges are Col. L. C. Bruce, C. T. Lewis, Esq. and Dr. S. W. Bridges. The stakes are open to members only. Following is a list of the entries:

ALL-AGED STAKE.

Berkley (N. D. Putnam), red Irish setter (Chief—Gussie).
Bessie (W. H. Force), liver and white pointer bitch (Sensation—Minecla).
Ruby (H. D. Polhemus), liver and white pointer bitch.
Dare (H. D. Polhemus), red Irish setter.
Don (W. B. Dickerman), liver and white pointer dog.
Moke (W. B. Dickerman), black, white and tan English setter dog (champion St. Elmo—Prairie Rose).
Brighton (S. B. Duryea), Gordon setter dog (Gypsum—Wrag).
Fred (A. T. Plummer), Gordon setter dog.
Doctor (W. H. Force), black English setter dog (Sid—Fan).
St. Ives (L. Waterbury), liver and white English setter dog (champion St. Elmo—Maida).
Force (L. Waterbury), lemon and white pointer dog (Vandevort's Don—Force's Bessie).
Pride (Chauncey Marshall) orange and white English setter.
St. Elmo V. (Dr. S. Fleet Speir), black, white and tan English setter dog (St. Elmo IV.—Countess Louise).
St. Elmo VI. (Dr. S. Fleet Speir), black, white and tan English setter dog (St. Elmo IV.—Lucy).
Canto (L. H. Bullard) breed and pedigree not given.
Gipsey Queen (L. H. Bullard), blue belton English setter bitch.
Max (L. H. Bullard), breed and pedigree not given.
Beau Suffolk (A. S. Swan), liver and white pointer dog (Tam O'Shanter—Fannie).
Count Jack (Jas. N. Jarvie), black and tan setter dog (Chancellor—Fan).
Blade o' Grass (L. H. Bullard), orange and white English setter dog (St. Elmo IV.—Countess Louise).
Prince Hal (John B. McCue), orange and white English setter dog (Champion St. Elmo—Maida).
Dan T. (Dr. S. Fleet Speir), black, white and tan English setter dog (Jesse Gladstone—Chatelaine).

BRACE STAKE.

Blade o' Grass and Max, L. H. Bullard.
Pride and Berkley, Chauncey Marshall.
Don and Moke, W. B. Dickerman.
Fred and Romeo, A. T. Plummer.
St. Ives and Doctor, L. Waterbury.
Force and Bessie, Wm. H. Force.
Count Jack and Prince Hal, Jas. N. Jarvie.
Dave and Ruby, H. D. Polhemus.
Faerie and St. Elmo VI., Dr. S. Fleet Speir.
St. Elmo V. and Dan T., Dr. S. Fleet Speir.

DERBY.

Gipsey Queen (L. H. Bullard), blue belton English setter bitch.
Count Paradox (Geo. R. Sheldon), English setter dog.
Force (L. Waterbury), lemon and white pointer dog (Don—Bessie).
St. Elmo VI. (Dr. S. Fleet Speir), black, white and tan English setter dog (St. Elmo IV.—Lucy). ROBIN.

THE WESTERN FIELD TRIALS.

Editor Forest and Stream:

I send you the list of entries for both stakes to the trials of the Western Field Trials Association, to be held at Abilene, Kansas, the week beginning Monday, Nov. 9. The number of entries exceeds our expectations, and as the birds are plentiful, hotel and livery accommodations ample, we are looking forward to a very successful and pleasant meeting. The first annual meeting of the association will be held the evening of the first day of the trials.

ALL-AGED STAKE.

Bridgeport (E. E. Pray, Denver, Col.), black, white and tan English setter dog, 3yrs. (Dashing Monarch—Vannette).
Joe (H. P. Dillon, Topeka, Kan.), red Irish setter dog, 3yrs. (Irish Ranger—Lady Trumbull).
Patsy (R. C. Van Horn, Kansas City, Mo.), red Irish setter dog, 2¾yrs. (Lord Dufferin—Queen Bess).
Cato (R. C. Van Horn, Kansas City, Mo.), red Irish setter dog, 1¾yrs. (Keno—Maude).
Richmond (John E. Gill, Franklin, Pa.), lemon and white pointer dog, 26mos. (Vandervort's Don—Beulah).
American Dan (T. W. House, Houston, Tex.), black, white and tan English setter dog, 5yrs. (Lincoln—Daisy Dean).
Trinket's Bang (Wm. Titterington, Wyanet, Ill.), white and liver pointer dog, 32mos. (Croxteth—Trinket).
Queen Bess (B. F. Price, Memphis, Tenn.), black, white and tan English setter bitch, 2yrs. (Gladstone—Donna J).
Prairie Storm (W. W. Judy, St. Louis, Mo.), English setter dog, 6yrs. (Charm—Prairie Belle).
Dash Dale (W. B. Lee, Kansas City, Mo.), black and white English setter dog, 6yrs. (Dash B.—Daisy Dale).
Tom (J. W. Blythe, Burlington, Ia.), pointer dog (Meteor—Accident).
Vanity (J. W. Munson, St. Louis, Mo.), liver and white pointer bitch, 3yrs. (Bang—Pride).
Count Rapier (W. B. Gates, Memphis, Tenn.), black and white English setter dog, 4yrs. (Druid—Magnolia).
Lillian (P. H and D. Bryson, Memphis, Tenn.), black, white and tan English setter bitch, 26mos. (Gladstone—Sue).

DERBY.

Floss (E. E. Pray, Denver, Col.), white and orange English setter bitch, 10mos. (Prince—Alice Dale).
Queenie (E. E. Pray, Denver, Col.), white and orange English setter bitch, 10mos. (Waters's Grouse—Daisy Dale).
White Cloud (Alonzo Campbell, Clay Center, Kan.), white, black and tan English setter dog, 15mos. (Druid—Princess Draco).
Rod (David Castleman, St. Louis, Mo.), white and liver ticked pointer dog, 18mos. (Meteor—Dell).
Krupp (G. C. Castleman, St. Louis, Mo.), white and liver ticked pointer dog, 18mos. (Meteor—Dell).
Don Burglar D. (George H. Laughton, Chicago, Ill.), black, white and tan English setter dog, 10mos. (Burglar—Queen Dido).
Blitz Burglar, D. (George H. Laughton, Chicago, Ill.), black, white and tan English setter dog, 10mos. (Burglar—Queen Dido).
Drake M. (A. A. Whipple, Kansas City, Mo.), liver and white pointer dog, 12mos. (Meteor—Maggie V.).
Bang B. (A. A. Whipple, Kansas City, Mo.), liver and white ticked pointer dog, 14mos. (Beaufort—Gertrude).
Belle B. (A. A. Whipple, Kansas City, Mo.), liver and white ticked pointer bitch, 14mos. (Beaufort—Gertrude).
Bow B. (A. A. Whipple, Kansas City, Mo.), lemon and white pointer dog, 14mos. (Beaufort—Gertrude).
Natalie (Joseph Hayward, Jr., St. Joseph, Mo.), black, white and tan English setter bitch, 15mos. (Gladstone—Donna J.).
Shot M. (R. M. Snyder, Kansas City, Mo.), liver and white pointer dog, 12mos. (Meteor—Maggie V.).
Malite (J. W. Munson, St. Louis, Mo.), liver and white pointer bitch, 17mos. (Meteor—Dell).
Meteorite (J. W. Munson, St. Louis, Mo.), liver and white pointer bitch, 18mos. (Meteor—Vanity).
Don (W. H. Blodgett, St. Louis, Mo.), liver and white pointer dog, 12mos. (Meteor—Phœbe).
Nortier (W. B. Gates, Memphis, Tenn.), black, white and tan English setter dog, 16mos. (Paul Gladstone—Bo-Peep).
Bob Bowles (W. B. Gates, Memphis, Tenn.), black, white and tan English setter dog, 16mos. (Paul Gladstone—Bo-Peep).
Dick (D. Underwood, Kansas City, Mo.), liver and white pointer dog, 18mos. (Meteor— ——).
Tom (J. W. Blythe, Burlington, Ia.), pointer dog (Meteor—Accident). A. A. WHIPPLE, Secretary.

Kansas City, Mo., Oct. 23.

PHILADELPHIA KENNEL CLUB FIELD TRIALS.

Editor Forest and Stream:

The second annual field trials of the Philadelphia Kennel Club will be held at Rio Grande, N. J., Nov. 17, 18, and 19, and will comprise: The All-Aged Stake, open to all setters and pointers owned by members of the P. K. C. The Derby, open to all setter and pointer puppies, whelped on or after Jan. 1, 1884, owned by members of the P. K. C. There will be two prizes in each stake, and the committee will add a third prize if number of entries warrant it. Entries will close Nov. 1 and should be made with Secretary of F. T. Committee. Entrance fee $5 each. Members desiring to visit the trials will please communicate with the secretary, in order that accommodations may be secured. Trials will be run under the new rules of the Eastern Field Trials Club. Judge of the trials will be Mr. C. S. Westcott, of Philadelphia. The following entries have already been made. A number more will be sent in before the closing date:

ALL-AGED STAKE.

Bruce (I. H. Roberts), red Irish setter dog (Elcho—Noreen).
Leigh Doane (I. H. Roberts), red Irish setter bitch (Elcho—Rose).
Jessie (I. H. Roberts), red Irish setter bitch (Elcho—Noreen).
Little Nell (I. H. Roberts), red Irish setter bitch (Elcho—Rose).
Leigh Doane II. (W. H. Child), red Irish setter bitch (Chief—Leigh Doane).
Victoria (Chas. T. Thompson), red Irish setter bitch (Berkley—Nora).
Cassino Gladstone (E. Comfort), blue belton English setter bitch (Gladstone—Countess Druid).
Leda (B. Ridgeway), lemon and white English setter bitch (Prince—Dashing Belle).
Prince Castle (B. Ridgeway), blue belton English setter dog (Prince—Dashing Belle).
Grouse (Mr. Richardson), lemon and white English setter dog (Grouse—Leda).
Mr. L. Shuster, Jr., has entered three dogs, names not ascertained.

DERBY.

Leigh Doane II. (W. H. Child), red Irish setter bitch (Chief—Leigh Doane).
Victoria (C. T. Thompson), red Irish setter bitch (Berkley—Nora).
Rowdy (E. W. Clark, Jr.), black and white English setter dog (Dashing Monarch— ——).

Several other entries have been made, names not ascertained.

From all reports there are plenty of birds on the grounds at Rio Grande, and as there is no shooting allowed on the 3,000 acres which the owners have kindly offered to the club for their trials, it is expected that enough coveys will be found to finish the races within the time specified.

The nearest hotels to the shooting grounds are those across the sound on Holly Beach, Sea Island City, and at Cape May. The club house at Rio Grande being limited in its accommodations to a few, members, handlers, judges and correspondents only can "camp" there.

The affair will not be gilt-edged but lots of provender will be provided, and it is hoped that all may have good appetites to enjoy it, and that plenty of birds will be found. MARK.

Philadelphia, Oct. 25.

THE FUTURE OF DOG SHOWS.

Editor Forest and Stream:

The abandonment of the Pittsburg and York, Pa., shows, in consequence of a lack of entries, the falling off both in numbers and quality of the entries at Philadelphia, the failure of the Chicago show to pay their premiums, and the almost invariable pecuniary loss that dog shows have suffered this season; are all indications that demand serious attention.

A Western editor has discovered that the falling off in entries at Pittsburg was due to the selection of Messrs. Mason and Watson as judges.

In view of the violent personal animosity of the man in question to these gentlemen, this discovery simply raises a smile. Not to waste serious attention on it, it suffices to state that these gentlemen judged at New Haven, where they had 296 entries in their classes, 163 of which were from outside the State of Connecticut. This is 55 per cent. At Philadelphia Mr. Mortimer, who is entirely acceptable to the editor mentioned, had 110 entries, only 39 of which were from outside of Pennsylvania. This is only 35 per cent. Comment is unnecessary, except to say that it is the outside exhibitor that scrutinizes the list of judges.

The significant fact for consideration is that dog shows, as a rule, have ceased to pay their way. Boston seems to have been the only one this season that made any money. Cincinnati showed a balance of $70, but their facilities for reducing expenses, and increasing receipts from "miscellaneous sources" were unique, the attendance at the show was a failure.

Now it cannot be expected that members of show clubs will go on paying money out of pocket for the pleasure of neglecting their private business and working like beavers for a fortnight or more. They don't expect to make money out of shows, but they have a right to expect that their time and trouble is all they shall be called on to sacrifice.

"Porcupine" has discovered that hereafter the local exhibitors must be relied on to furnish the bulk of the entries. I don't see how this is to help the case if the present relation of revenue and expenditures is to be maintained.

It has been the uniform result of the inquiries that I have made, that the attendance at shows has been disappointing. The problem is, how to increase attendance, or how to reduce expenses. The former seems an unsolvable conundrum, the latter may receive several answers—the premium list may be reduced in amount, etc. It has always seemed to me that exhibitors took a wrong view of the case, when they expect to make a profit by showing, even to get square is more than they have a right to expect. To nobody are dog shows an absolute necessity but to breeders and exhibitors. Without the opportunities thus afforded of seeing other dogs, comparing notes, etc., what a tremendous task it would be to breed dogs of type! So as the breeder and exhibitor is the one chiefly benefitted, on him should fall the burden of supporting the show. This may seem harsh doctrine, and it may be all wrong, but it is worth while taking it into consideration. Or is it possible that dog shows as such have lost their attractiveness to the public? That skating rinks, base ball, etc., have displaced them in popular favor?

There is no use in going on in the miserable mimicry of the wearied ostrich that has prevailed so long. Lauding shows like New Orleans, St. Louis, Milwaukee or Dayton, does not change facts, precious few are deceived, and they are soon undeceived. In this connection the comments of FOREST AND STREAM on the Philadelphia show are in good tone, noting plainly the shortcomings of the show, and also the hard work of the managers to make it a success.

With all respect to the memory of our late good friend

Charlie Lincoln, I cannot but think that a good deal of the trouble we have is a legacy from him. We all remember his jolly slip and go easy ways, postponing all disagreeable matters, smoothing down ruffled tempers, yet doing nothing to cure the evils complained of. Now that we have no such smoothing iron, shirt bosoms have got in a fearfully rumpled state. Then it must be confessed that there was a strong dash of humbug in Charlie's methods, puffing in the daily papers some beast as "the beautiful ——;" dogs entered as valued at $500 appearing in the catalogues as valued at $5,000, etc., all added a false glamor to shows, which soon wore off, and left an aching void.

I had a curious illustration of this. One of our officers was very indignant at "Porcupine" for saying that there was a feeling that the Philadelphia show would operate to the disadvantage of ours. "Why," said I, "did he not say that the feeling was not justified by the facts of the case?" "Well, he ought not to have said it," was all the answer I could get. Since then, I have mentally cursed dog show managers as well as intending exhibitors. The way the latter can devil the committee about classifications to suit their dogs, beats all the efforts of a dozen sparrows after a robin. Monks wants the bullfoundland class divided between blue and green dogs, Tom Collins wants the rackabone class divided between hexagonal and octagonal dogs, and so on *ad infinitum*. What "true cockers" would demand as a just recognition of their merits, would beat a whole guessing school. W. WADE.

HULTON, Pa., Oct. 23, 1885.

PRINCE CHARLES SPANIELS.

Editor Forest and Stream:

In reply to your statement regarding the black, white and tan toy spaniels, I will say that I have carefully looked over the works of Stonehenge, Vero Shaw and Idstone, and I can find no mention of the Prince Charles spaniel. In speaking of the King Charles of fifty years ago, Stonehenge says they were usually of a black, tan and white color. Vero Shaw says the King Charles should be either black and tan or black, tan and white. Idstone, in speaking of the King Charles of thirty years ago, mentions a superb black, white and tan bitch.

Now, Mr. Editor, I would like to ask you how and where the black, white and tan came by the name of Prince Charles spaniels. DR. G. WALTON.

BOSTON, Mass.

Editor Forest and Stream:

In last week's issue I notice a letter from Dr. G. Walton, of Boston, asking what is a Prince Charles spaniel, and your reply thereto.

With all due respect to FOREST AND STREAM as a reliable authority on dog matters, I, and probably Mr. Walton and others, would be glad of a little more light on this subject. For myself I confess I doubt the correctness of your answer to Mr. Walton's question. I may be wrong, and if so am willing to learn, but so far I have never heard of Prince Charles spaniels and have never seen them mentioned in any kennel works as far as I can remember. HEMLOCK.

MATTAPAN, Mass.

[While of course we take great pleasure in giving information to our readers, we do not altogether like to be obliged to repeat the same thing over twice. Dr. Walton's experience in breeding spaniels may be great, but a little familiarity with the literature of a breed is important if one is going to write about it for the printer. There is progress in dog matters as in other things, and it is not possible to learn everything about our pets from the pages of "Stonehenge," Vero Shaw and "Idstone." The name Prince Charles was given to the tri-color King Charles spaniels by the English Toy Spaniel Club and has been adopted by the principal shows throughout England.]

BEAGLES AT PHILADELPHIA.

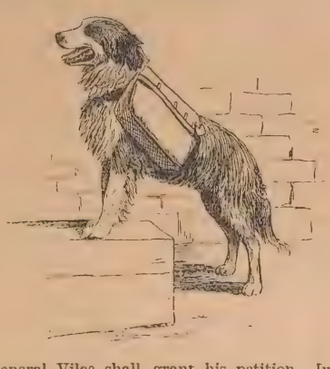
Editor Forest and Stream:

The article under the above heading which appeared in your last issue contains a few remarks concerning my dog Bannerman which are misleading and therefore demand this reply. I always claimed Bannerman to be under 12 inches in height, and do so yet, Mr. Schellhass to the contrary notwithstanding. If properly measured Bannerman will always be found nearer 11 than 12 inches. I deny the assertion of Mr. Schellhass, that all the parties who measured Bannerman last spring made him over 12 inches. There was quite a diversity of opinions on that occasion. The measuring then was very improperly done, viz., with sticks.

At the late Philadelphia show Bannerman was again measured at my request by the judge, Mr. Stovell, and he, as well as all present, pronounced him almost an inch short of 12 inches. Among the gentlemen present were Messrs. Pottinger Dorsey, Dan O'Shea, W. H. Ashburner, W. L. Crittenden, L. D. Sloan and others, all of whom I think will willingly testify to my assertion.

Now in regard to what Mr. Schellhass says concerning my entering Bannerman in a class over 12 inches, I will say that owing to the absence of a champion class for beagles under 12 inches (and Bannerman having won three firsts, therefore eligible to the champion class) I supposed that I had a perfect right to enter in the only champion class which was provided for beagles. I did not take into consideration the probability of my dog being ruled out for being under size. It was a great mistake on the part of the Philadelphia Kennel Club to insert the clause "over 12 inches" in connection with their champion class. Before dismissing this subject let me say that I did not enter Bannerman in a class over 12 inches, thinking that he belonged there, as Mr. Schellhass wishes to convey, but for the reasons given above.

In conclusion I will say that I was one of those present when Mr. Schellhass's dog Trailer was measured, and the fact that the dog was oversized was apparent to every one present. Mr. W. L. Crittenden, who led the dog into the ring, also acknowledged the fact. This I only mention in justice to the judge A. C. KRUEGER.



WRIGHTSVILLE, Pa., Oct. 26, 1885.

THE ST. BERNARD BERYL.—In our comments on the St. Bernards at Philadelphia we stated that "Beryl was out of coat." Her owner writes us that this was indeed the case, as she was dead. In examining the dogs we found a bitch in Beryl's stall, and our notes read as follows: "Faulty in head, ears and tail, a bit light in bone, out of coat." As Beryl was criticised in our report of the New York show last year we made no comment except that she was out of coat. We did not find Bertha, No. 35, in her stall, and have no notes against her number and conclude that this bitch was in the wrong stall and had probably been removed from her puppies by her keeper. As both belong to the same kennel, this can easily be determined by the owner. We only wonder that many mistakes of the kind did not occur, as many of the dogs were in wrong stalls. We found Dashing Monarch in the stall belonging to Rockingham, with a crowd around admiring the celebrated champion. Had we not known the dogs our report might have been a little mixed.

LADY MAUD.—Ellicott City, Md., Oct. 26.—*Editor Forest and Stream:* Will you grant me space in your columns simply to convey to Mr. John W. Munson a small piece of intelligence. The pointer bitch Lady Maud, very high com. and reserve at the late Philadelphia show and also noticed in your report of the same, is one of the "pair of weeds" that Mr. Munson pronounced last year as "the worst he ever saw." She is also 4½ years old. I have no comments to make.—T. B. DORSEY.

DORSEY.

DORSEY is the suggestive name of a California mail-carrier. Dorsey is probably the only postal employe in California who has not trembled for fear of losing office on the ground of offensive partisanship. But Dorsey has not even voted. He is a dog. His official wages are small, and through the proper authorities he has made application to have them increased. At present he gets two beefsteaks a week. He wants his salary raised to seven steaks a week and mileage. His constituents have signed a petition to that effect, and the dog looks anxiously forward to the day when Post-

master-General Vilas shall grant his petition. In the cut given above, which is taken from a photograph of the carrier in costume, Dorsey is shown smiling broadly over the prospect of increased wages. The drawing is by the artist of the New York *World*. It is from a photograph sent to Mrs. Rusa Bodenstein, of No. 204 East Fifty-first street, by her son, who is a mine owner at Bismarck, along the line of route over which Dorsey travels. The miners who live in the dog's district feel so kindly toward the novel carrier that no cabin is considered complete without a picture of their pet hung in the most conspicuous place. Once a month or so, whenever a traveling photographer strikes the town, Dorsey has to submit to be photographed. He has grown to like the process now and seems to understand what it is all about. Whenever one of these traveling artists appears the dog is the first to scent him out and to pilot him to the country store that serves as post-office. Here he waits to have his mail bag strapped on, and, when all is properly adjusted, he poses in full uniform as patiently as a society actress the day before her debut.

Before Dorsey was appointed regular mail carrier between Calico and Bismarck, in San Bernardino county, his reputation was not the best. He was said to be lazy, and would rather loaf away the summer days in a shady spot than work for a living. He is a black and white collie with sharp nose, bright, quick eyes and the usual shaggy coat. The way he came to be installed as a Government employe was this: The postmaster at Calico had a brother in the mines at Bismarck to whom he wanted to send word one day. The place was three miles up the mountain, along a bare, stony road, burning with heat. It was a hot, toilsome tramp and no one in the village offered to go. So the postmaster thought he would send Dorsey just to see how it would work. The letter was written and tied around the dog's neck, his head was pointed up the Bismarck road, and he was told to "git out fur Bismarck." He started, ran a few rods and stopped. But a shower of stones started him again, and that was the last seen of him in Calico that day.

The next day he returned from Bismarck with an answering letter tied around his neck. He had been well treated at the mining camp, was fed well and petted on his return, and seemed very proud of his achievement. After this other letters were sent in the same way, and by-and-by the miners asked that all their mail be sent up by the dog route. There were more than he could carry, so a little mail bag with brass trimmings and the usual Government lock was purchased and fitted to Dorsey's back. The bag is fastened by two straps, one around his chest and the other around his forelegs. When the bag was first strapped on his back a grand ceremony was held by the miners and the postmaster, and Dorsey was formally and officially installed as carrier with a salary of two beefsteaks a week and promise of increased pay if he behaved himself. Now residents of San Bernardino county have grown to look upon the dog as a regular institution quite in the ordinary run of affairs.

Dorsey knows when the stage that brings the mail is due, and on those occasions he sticks closely to the post-office. When the letters and papers have been sorted out the postmaster says, "Dorsey, the mail is ready," and the dog stands soberly to have the bag strapped on. Then, with a sharp bark of farewell, he trots over the hills on a little trail he has worn himself. If he meets a stranger he makes a wide detour to avoid him, and when other dogs try to be friendly and get up a little fight with soft gloves, so to speak, gravely declines and goes on his way. He will not run any risk of losing the mail. Arriving at Bismarck he stops at six or seven of the principal houses in town and standing at the front door barks until some one comes out, examines the bag and takes what belongs to him. Then Dorsey trots on to the next house and so on throughout his route. Only a few known friends are permitted by him to open the bag. Then at night the miners give him a big supper and the next day he starts back for his office at Calico with letters bound for the post-office.

Post-office Inspector T. F. Tracy, sent out by the Government to inspect California mail facilities, reports the Dorsey dog route the most faithful and prompt in the State.

A newspaper suggests the formation of a corps of messenger dogs, to take the place of or supplement the commissionaires and the telegraph boys of the London streets. The dogs should be uniformed to the extent of a distinguishing badge around their neck—and would be divided up into districts, each stationed at a certain street corner, from which he knew his way well to the nearest postal telegraph office. When a man wanted to have a telegram sent or a letter mailed, he would whistle to the dog, slip the money and the message into a bag at the dog's throat and send him off, then he would be expected to make a bee-line for the accustomed office, whence he would be again sent to his street corner (with an answer, if necessary), to wait for another customer. If the scheme should be thought worth the trying, there is no reason why it should not be successfully carried out. Every one can recall instances, which he has seen or heard of, of dogs which had been taught to call regularly for the family mail or the newspaper, and take it to their master, and in some parts of rural England the intelligent beasts have been pressed into Government service and cover a regular postal route every day. What, then, is there to prevent them being regularly organized into corps and taught to do the small offices which would be required of them as messenger dogs? No one who thinks of all the dogs he has known, and remembers the famous dogs of history, will doubt their intelligence and fidelity. And, in some particulars, the dog would certainly be an improvement on the messenger boy. Dogs do not play marbles, nor will they go many blocks out of their way to follow a circus. No one ever saw a dozen hounds sitting on their haunches watching a man peddling patent match safes, and they are proof against the seductive influence of a fire alarm. The messenger youth, on the other hand, is a frail thing, easy of temptation and subject to mortal weakness. Whatever other results that would follow the mobilization of this novel army, the public would at least gain in rapidity of service, while the Government (or the company which managed the dogs) would be free from all apprehensions of a strike among its employes.

CONCERNING KICKERS.—Mr. W. Wade writes to the *Stock-Keeper* in reference to an article about "American Kickers," written to the *Scottish Fancier* by "Corsincon:" Now, my excellent friend "Corsincon," you have accurately described an animal that is often to be found at our shows; but, good conscience! you have got the name all wrong. Fact is I think you come nearer the description of the genuine article of American "kicker" than almost anybody I know. The "kicker" is just what the name describes; he kicks, and, if he is worthy of the name, somebody knows that he has done so with a forty-mule power. About as fair an illustration of what we "kick" for is the matter of "Daniel at Bristol show"; only the American kicker generally takes much stronger ground, and uses much stronger language than Mr. Sheffield did. An exhibitor, Mr. Gregg, once paid three dollars for the entry of a mastiff puppy. When the judging came on, he was rather astonished by having a whole litter of four, that had paid five dollars entry as a litter, brought out against him; and when one of this litter won, he kicked most emphatically, and was no ways sparing of free expression of his opinion of the honesty of the transaction; and, of course, he won first honors in the wordy war that followed. When Mr. Mason's pointer, Beaufort, was beaten under a judge who owned a winning dog a day before the show, did not own her when judging, and did own her a week after, he "kicked," the result being an angry war, now famous as the "pointer protest," in which Mr. Mason achieved the greatest victory I ever knew won in the press, for he converted several who had been hostile to him to friends. Why, confound it, "Corsincon," when Mr. Hammond, of the FOREST AND STREAM, introduced me to you, before he gave my name, did not he class me as a "kicker", one of those who "kicks" when his dog wins as readily as when beaten? Not that I propose to set myself up as a guide for you or anybody, but surely you will not take me for one of the beautiful animals you describe as "kickers." The correct name of the beast you mean is "sorehead," a fellow who measures the correctness of the judges' decisions by the place his dog gets; like that Irish terrier exhibitor, who swore high and low at you for not putting his dog first, when such judges as Jas. Watson and R. H. Barlow said his dog might be a terrier, and might have come from Ireland, but could not see the Irish terrier in him. No sir, the American "kicker" is a most worthy specimen. If his dog is put back when he ought to have won, the genuine kicker says so, and give his reason for it; but, be he right or wrong, he does not indulge in the little shines you depict. For myself I glory in belonging to the noble army of kickers, exemplified by Messrs. Mason, Watson, Gregg, Greene, etc.—men who are not afraid to speak their minds over their own signatures; just like you, "Corsincon." By the way, "Corsincon," in all your American experience you never had an odder one than that solemn procession at Cincinnati, when the setter Dido was taken out of her stall. It was a very solemn and affecting scene. Then why don't you give us your ideas of American dogs? Our foxhounds, for instance, what a new breed they were to you? and don't you forget to laugh at our stories of hounds running fifty miles or more on a chase. You didn't more than half believe me when I assured you that it was quite possible, for when hounds get after a deer there is no knowing where they will go, how long they will be away, or whether they will ever get back. You see, fox hunts are a very different story here from with you. I would like to see a party of horsemen following the hounds through one of our laurel thickets and over our hills and dales. All that the biped participants in a fox hunt get is sitting on their horses and hearing the dogs give tongue, seeing them perhaps once in a run, so tongue is more important in a hound than speed. I ask you to give us your ideas of American dogs and doggy things. Don't fail to dwell on the inspiring sight of an exhibitor squatting down, with one hand under a setter's nose, the other holding out the tip of its tail, slueing the critter round to catch the judge's eye. It always looks to me like "one dog, one fool, and a judge." Now give us your impressions. We want to know just how we strike a habitué of your English shows, where we are deficient and where we are strong.

A FAITHFUL MASTIFF.—A correspondent sends us this story of a mastiff's characteristic performance of duty: "About fifty years ago, in South Wales, one of the workmen on a farm coveted some of the apples in the best orchard. He knew that his master had a mastiff in it at night, but he had been used to the dog since he was a pup, so he was not afraid of it. He made a hole in the wall on the top of which grew a white thorn hedge, that a bird could not go through, and in the night crept through. The dog came to meet him. The man picked the choice apples and in high glee prepared to leave, but no, the dog would not let him go. The man could not believe himself at first, but after many trials he gave up the idea of taking the apples, and emptied them out of his bag. Then he tried to go, but the dog thought that everything was not right, and refused again. He tried for hours to no purpose, and yet the dog treated him kindly except when he wanted to leave. At last the man took his knife and cut the faithful animal's throat, killing him on the spot. The next day £100 reward was offered for information who killed the dog. The man fled to America and told the whole story when safe from justice."

SPANIELS AT PHILADELPHIA.—*Editor Forest and Stream:* "A man who will not stand up for his dog is just no man at all" (FOREST AND STREAM Oct. 22). Well, I am going to stand up for my dog now, but do not think I am a disappointed exhibitor, for I am not. We won the kennel prize at Philadelphia and can do so again any time we try for it. In your report of the Philadelphia show, Oct. 15, you say: "Brahmin had no difficulty in beating Hornell Silk in the champion cocker class. He [Brahmin] is a niceish little dog, and but for a *little legginess, lightness of bone and heaviness of brow* would take a lot of beating" (italics mine). If you had added that he was cat-sided, straight behind and has a field spaniel head, you would have hit the mark exactly; and as Silk is only faulty in coat and head I claim that the judge had no right to place Brahmin first. I raised Brahmin from a puppy until he weighed thirty pounds, then I sold him.—J. OTIS FELLOWS.

THE PHILADELPHIA SHOW.—*Editor Forest and Stream:* Coinciding with Mr. Schellhass's experience with the Philadelphia Kennel Club's management, I wish to say that a dog I entered, and sent there by express, arrived home promptly and in excellent condition, and equally to the point, a premium won arrived almost as soon as the dog.—W. WADE (Hulton, Pa., Oct. 24).

PEDIGREE OF LOUISE.—*Editor Forest and Stream:* Can any of your readers give the pedigree of the beagle bitch Louise. She was bred by Mr. Colin Cameron, I believe. I would like her pedigree as far as known.—H. F. S.

THE WINSTED DOG SHOW.—Mr. James Watson, of Philadelphia, will judge all classes at the dog show to be held at Winsted, Conn., Dec. 15 to 18.

BAVARIA has 203,200 dogs, the tax on which amounts to $250,000; and everybody is happy.

KENNEL NOTES.

KENNEL NOTE BLANKS.

For the convenience of breeders we have prepared a series of blanks for "Names Claimed," "Whelps," "Bred" and "Sales." We request that all Kennel Notes be sent to us on these blanks, which will be forwarded to any address on receipt of stamped and directed envelope. Send for a set of them.

NAMES CLAIMED.

Midnight. By E. Holley, Jr., Rhinebeck, N. Y., for black cocker spaniel bitch whelped June 6, 1885, by Jet (Wildair—Bird) out of Honest Bert (Chance—Fly).

Muggs. By E Holley, Jr., Rhinebeck, N. Y., for liver, white and ticked cocker spaniel bitch, whelped April 2, 1885, by Colonel Stubbs (A.K.R. 302) out of Fly (Baby—Fido).

Cricket. By E. Holley, Jr., Rhinebeck, N. Y., for liver, white and ticked cocker spaniel bitch, whelped April 2, 1885, by Colonel Stubbs (A.K.R. 302) out of Fly (Baby—Fido).

Gracie Stubbs. By E. Holley, Jr., Rhinebeck, N. Y., for liver, white and ticked cocker spaniel bitch, whelped April 2, 1883, by Colonel Stubbs (A.K.R. 302) out of Fly (Baby—Fido).

DEATHS.

Treasure II. Pug dog (A.K.R. 2148), owned by the Essex Kennels, Andover, Mass., Oct. 11.

Petrel. Lemon belton English setter bitch, whelped 1873, by Prince (Dash II.—Moll III) out of Lill II. (Dash II.—Lill I.), owned by E. I. Martin, Wilmington, Del.

KENNEL MANAGEMENT.

☞ **No Notice Taken of Anonymous Correspondents.**

C. B. S., Elmira, N. Y.—My spaniel has had what I suppose to be mange. He is cured, but the hair is off his back in places. Ans. Give three drops of Fowler's solution three times daily. Increase by one drop daily to ten drops, and then decrease in the same manner. Wash parts daily with sulphur soap.

A. F. H., Leadville, Col.—Dog taken a few few months ago with distemper; had one bad fit. Of this I succeeded in curing him, but he now has what seems to be the direct result of the distemper, a peculiar twitching and jerking of the body and legs; also of the tongue, like "St. Vitus Dance." Ans.—Have some pills made, each to contain of the citrate of iron and strychnine two grains, and of the valerianate of zinc one-half a grain. Conceal a pill in a morsel of raw meat and let the dog have one three times daily. Do not feed on meat as a rule, and see that the bowels are in order.

C. M. R., Buffalo.—A large St. Bernard dog seems to be afflicted with some kind of lameness. Whenever he gets up from the ground he tries to scratch himself with one of his hind legs and always with the same one. He makes the same motion that a dog makes when you pat him on the back. Will you be so kind as to inform me in your next issue what the matter is and the remedy? Ans.—We cannot tell from your description what, if anything, is the matter with your dog.

J. C., Atlantic City, N. J.—Two Irish setter pups, nine months old, are very thin; have no appetite. One has sores on the ear and rump, the hair is now growing out again over the bare places. They have had the diarrhœa for six weeks, and passages are bloody once in a while. I have meat and burnt flour, but they will not eat. They do not have any fever nor do I hear them cry with pain. Ans. Your pups suffer from dysentery. Begin treatment with a full dose of castor oil, then give a powder containing one grain of opium and ten grains of the subnitrate of bismuth. Feed boiled milk and very little meat. Report result.

W. L., Norwich, Conn.—I have a red Irish setter whose coat is rough and who sheds his hair all the time. He has been fed on scraps from the table and milk, has been very loose until lately. I dropped his milk and his bowels are more healthy, both in consistence and color, but look much like weed seeds or small particles collected together. He has much trouble in retaining or digesting his food, sometimes vomiting his breakfast at night in nearly the condition he swallows it. He is thin in flesh, nose moist and cool most of the time. Ans. Your dog has indigestion. You must be careful of his diet. Give mostly fluid food, plenty of milk with a tablespoonful of lime water to the pint, give soups without fat, in which you may crumble bits of toast. Give a little scraped raw meat mixed with the white of an egg once each day. Give plenty of outdoor exercise, and keep the bowels regular with syrup of buckthorn, teaspoonful doses.

POINTS WORTH CONSIDERING.

1. Because of the compact style of its typography the Forest and Stream actually contains, weekly, more reading matter pertaining to its chosen field than is found in any similar publication in the world.

2. In general excellence the reading columns of the Forest and Stream are of a higher grade than those of any similar publication in the world.

3. Taking into account the amount and the character of weekly reading given, the Forest and Stream is away ahead of any similar publication in the world.

4. If a sportsman wishes a sportsman's paper, he will be better suited by the Forest and Stream than by any similar publication in the world.

POT LUCK FROM EXCHANGES.

Edinburgh, Oct. 20.—The action of Mr. Ross Winans, the Baltimore millionare, who owns an extensive deer park in northern Scotland, in closing a roadway on his property at Guisachan, so angered the people in that vicinity that they mobbed and stoned him on Sunday last. Mr. Winans has offered a reward of £500 for the capture of the culprits.

Tuxado Park.—There was filed Oct. 28 in the County Clerk's office the certificate of incorporation of the Tuxado Park Association. The objects of the association are stated to be the introduction and cultivation of game in the lakes and streams within the boundaries of the lands owned by the association situated in Ramapo and Monroe, this State. The incorporators are Geo. D. Finlay, Wm. Kent, Pierre Lorillard, Jr., Gouverneur Tillotson and Peter Lorillard.

Day by day, to deck your toilets, birds of paradise are slain,
Humming-birds are shot by thousands, striving to escape in vain;
Argus pheasants, rare kingfishers, birds of every clime and hue,
Are destroyed in ruthless number, thanks—and thanks alone to you.

* * * * * * *

End it, lovely woman, end it, and for your fair sex's fame
Let the craze for silly fashions no more stifle pity's claim.
—*London Truth.*

On the banks o' Deer Crick—there's the place for me!
Worter slidin' past you jes' as clear as it can be—
See yer shadder in it, and the shadder of the sky,
And the shadder of the buzzard as he goes a-lazin' by;
Shadder of the pizin-vines, and shadder of the trees,
And I purt' nigh said the shadder of the sunshine and the breeze!
Well, I never seed the ocean, ner I never seed the sea,
But on the banks o' Deer Crick is grand enough fer me!
—*J. W. Riley, in Indianapolis Journal.*

The Nation's Forest Area.—The letter of Special Timber Agent Haley to Commissioner Sparks, of the General Land Office, complaining that millions of feet of lumber have been cut from the public domain without warrant of law, directs attention to the whole question of the preservation of the nation's forests. The task of preserving the Adirondack forests, entrusted to Messrs. Basselin, Cox and Knevals as State Forestry Commissioners, has been the subject of discussion in every part of the Union, but the devastation of timber in the remote States and Territories has to a great extent escaped the surveillance of the public eye. The last census gives the total forest area of the United States, not including Alaska, as 440,990,000 acres, but statisticians say that the lumber is swept from more than 50,000,000 acres annually, and the exhaustion of the supply cannot be distant if the drain is not checked. Forests fires consume more than 10,000,000 acres of forest annually, and the depredations of timber thieves result in perhaps greater waste. It is time for the enactment of laws for the protection of the forests in every part of the Union, and a half of the fine imposed for each violation should go as a reward for evidence to convict.—*Ex.*

A letter was yesterday received at Castle Garden, written in German and dated at Mentor, Wis., October 7, 1885. It stated that the writer early in May last left his home in Bremen and went to live at Mentor. The writer's dog Fritz was left at Bremen in charge of his brother Albert Otto. On Oct. 6, while the writer was out in the field, to his great surprise his dog Fritz came limping toward him. "He knew me," added the writer, "and whined piteously. His feet were much worn by travel and every step left a mark of blood upon the ground. I want to know if he passed through Castle Garden, as I am entirely at a loss to find out how he came to me, a distance of over 5,000 miles." The letter was signed "Charles Otto." The story of the dog's travels was told by a quartermaster on the steamship Leerdam, who heard it through a boarding house keeper. He said that Fritz never left the wharf at Bremen after his master sailed, but waited until another vessel came in and went on board. She was an American bark, and after unloading sailed away with Fritz as passenger. The bark landed in New York about a month ago, and Fritz it is claimed was found by a boarding-house keeper, who took him to a Castle Garden employe, who from the name on his collar found that he belonged to Otto. A search of the books told where he had gone to, and attaching a card to the dog's neck directing him to his master he was sent West in charge of an immigrant. The immigrant it is presumed, fancied the dog, and resolved to keep him for his own. He therefore took off the collar. Fritz by some instinct must have traced his master and surprised him as the letter says. Fritz is described as a large St. Bernard, with an intelligent face and splendid coat of hair.—*The Morning Journal.*

Basset or Beagle Wanted.—I wish to obtain a basset or beagle dog puppy—the former preferred—from 8 to 12 months old, house broken; must not be more than 12 or 13 inches high and fairly good-looking. Address, with lowest price and particulars, Ivan, this office.—*[Advt.*

Rifle and Trap Shooting.

RANGE AND GALLERY.

JAMESTOWN, N. Y., Oct. 24.—Score of yesterday made at 200yds., off hand, Creedmoor target, strong 11 o'clock wind:

Dowler	4554444444—42	Lonugren	5544054444—39
Sprague	4454444334—38	Moore	4444435444—40
Brown	4444445445—42	Jones	4455444444—42
Hazeltine	4344444445—40	Burns	4444544454—42
Ward	4445543444—41		

Mr. Lonugren missed the target by his gun holding fire, with no rule to govern that special point; should he be allowed another shot? Our rules governing an accidental shot is, if the shooter has his gun to his shoulder the shot must be scored, but if the gun is not to his shoulder he is allowed another shot.—R. H. B.

CREEDMOOR, Oct. 24.—The eleventh marksman's badge match for 1885 was shot to-day at Creedmoor. The weather was fine and the attendance large. Good scores were made at both ranges, the following being the highest:

	200 Yards.	500 Yards.	Total.
G W Lotz, 12th Regiment	21	24	45
W H Greenland, 23d Regiment	21	23	44
J McNevin, 18th Regiment	21	23	44
*McC Bull, 12th Regiment	22	22	44
*J Klein, 17th Separate Company	21	22	43
*E F Young, 7th Regiment	19	23	42
W P Pickett, 22d Regiment	21	22	43
*D E Watson, 71st Regiment	20	21	41
L J Elliott, 23d Regiment	19	20	39
J M Schuyler, 7th Regiment	20	19	39
H C Smith, 22d Regiment	17	21	38
E H Eagle, 12th Regiment	19	19	38

*Winners of former matches.

Arnaud Koecnlen, President of the Society les Carabiniers, Lillois, France, was present to inspect the range.

BOSTON, Oct. 24.—The Saturday shoot of the Massachusetts Rifl Association took place at Walnut Hill to-day. The weatner conditfon were not good. A tricky fishtail wind prevailed and proved too much for the skill of those who were after clean scores:

Decimal Match

B G Warren, C	10	7	8	10	9	7	10	6	8	10—84

Logan	4440434444—34	Two average scores of 39 1-7	78 2-7
Munroe	3533243433—33—355		
			352 2-7

*Two points added for military rifle.

THOMASTON, Conn., Oct. 26.—Scores of Empire Rifle Club for Oct. 17:

Gilbert	12	10	10	10	12	10	12	11	11	10—108
Thomas	11	11	11	11	7	11	12	12	7	10—108
Lemmon	11	8	10	10	11	10	8	10	10	12—100
North	9	9	8	9	10	5	11	10	9	10— 90
Williams	11	8	11	10,	8	7	8	10	9	8— 90

Scores Oct. 24.—Strong wind, bright light. The range, looking to the south, is a very bad one to get good scores on at this time of the year, for the sun shines directly in our faces:

Thomas	9	11	11	10	11	11	11	8	11	11—104
Lemmon	10	9	10	10	10	11	12	11	9	10—102
North	10	10	10	12	7	10	11	9	10	10— 99
Gilbert	10	10	8	11	10	9	11	6	11	10— 96
Williams	9	8	10	9	10	7	8	9	11	12— 93

QUEER PRIZES.—London *Truth* pokes fun at the utilitarian notions of the prize committees on the English ranges in the following paragraph: "I referred a week ago to the absurd character of some of the prizes offered for competition at volunteer shooting matches. Matters seem to be getting worse instead of better in this direction. Among the prizes set before the Second Oxford R. V. the other day were bottles of whiskey and gin, gallons of beer, a clothes brush, a pair of braces and a fork, spade and shovel. The Third Norfolk, however, have even a more ridiculous record, for the winner of a recent competition found himself to be the proud possessor of a pig's head!"

THE TRAP.

YONKERS, Oct. 22.—Match shot on the grounds of the Yonkers Gun Club between teams of the Yonkers Gun Club and Washington Heights Gun Club; 10 live pigeons, 25yds., 30yds. boundary, both barrels, H. & T. traps:

Yonkers Gun Club.		Washington Heights Gun Club.	
G W Langran	1111111101—9	Glasser	1001101111—7
O Austin	1110110111—8	J Terwilliger	1101111111—9

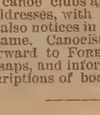
M Boyce	1110100111—7	W Applegate	1011001111—7
B Heyman	0000111101—5	R B Cusack	1000111010—5
D Robbins	0110101110—6		

In the shoot-off Newman won the trophy. The first sweepstakes was won by Dr. Robbins and W. Kelsey second money. The match between Pettingill, Worthington and Cusack was won by the latter.

MALDEN GUN CLUB, OCT. 24.—There was a fair attendance at the grounds of the Malden Gun Club, at Wellington, this afternoon. Following are the winners in the several sweeps: 1. Five blackbirds—Wardwell and Snow divided first. 2. Five blackbirds—Snow and Brown divided first. 3. Five clay-pigeons—Snow and Braley divided first. 4. Five birds—Pond and Swift divided first. 5. Five blackbirds—Brown and Adams divided first. 6. Three pairs blackbirds—Snow and Swift divided first. 7. Ten clay birds, medal match—Wilson and Wardwell divided first. 8. Five birds—Wardwell first. 9. Five birds—Snow and Wardwell divided first. 10. Five birds—Pond first. 11. Three pairs blackbirds—Pond and Swift divided first. 12. Five birds—Wardwell and Stanton divided first.



National Gun Association Tournaments.—Special Notice.—Members desirous of organizing tournaments in their vicinity, under the auspices of the Association, are requested to notify the undersigned. All the expenses of the same will be paid by us. Make your arrangements for 1886. We propose to establish a circuit of tournaments annually. Claim your dates now. General office and headquarters, Macon, Ga.—Matt R. Freeman, Vice-President and General Manager; F. C. Ethridge, Secretary, Macon, Ga. Send 10 cents for hand book containing rules, constitution, etc. "Fairly started and its future depends entirely upon the manner in which the sportsmen throughout the country respond."—C. M. Stark, April 18, 1885.—*Adv.*

Canoeing.

Address all communications to the Forest and Stream Publishing Co.

CANOEISTS *are invited to send us notes and full reports of cruises, club meets, information about canoeable waters, and other communications of interest.*

Secretaries of canoe clubs are requested to send to FOREST AND STREAM their addresses, with name, membership, signals, etc, of their clubs, and also notices in advance of meetings and races, and reports of the same. Canoeists and all interested in canoeing are requested to forward to FOREST AND STREAM their addresses, with logs of cruises, maps, and information concerning their local waters, drawings or descriptions of boats and fittings, and all items relating to the sport.

AMERICAN CANOE ASSOCIATION.

SECRETARY—Dr. C. A. Neidé. Schuylerville, N. Y. Candidates for membership must forward their names, with $3 for initiation fee and first year's dues, to the secretary, who will present names to the the executive committee. Money should be sent by *registered letter* or money order.

A WESTERN BRANCH OF THE A. C. A.

THE following letter has been sent by Com. Rathbun for publication, and the circular appended has been sent to all Western members of the Association. It was resolved at the annual meeting to take steps toward the formation of a Western branch, provided the Western members of the Association desired it. So few were present at Ballast Island that it was felt that they did not properly represent the Western canoeists, and before recognizing the organization there formed the officers of the A. C. A. desire the opinion of all interested as to what is best for the advancement of Western canoeing. The means were provided at the annual meeting for the organization of a Western branch on equal terms with the Eastern branch as the present organization would then become, and if the Western canoeists will act promptly in the matter the scheme can be perfected at the meeting on Nov. 7, at Oswego.

DESERONTO, Ont., Oct. 19. *To the Western members of the American Canoe Association.*—Gentlemen: The following circular letter has been sent to the address of all the Western members of the A. C. A. as contained in the Association Book for 1885. A number of these letters have been returned by the post office authorities on account of the address being insufficient. As the executive committee, at their meeting on Nov. 7, desire to have a full expression of opinion before taking any decided steps in relation to the proposed division of the Association, I would urgently request any Western member who has not received or answered the circular to write me fully his opinion and answers to the questions given as early as convenient. I will only add that as a large number of the Western members were among the pioneers in the Association, contributing very largely in the past to its success, while they now derive but little benefit from its membership, special attention will be given to the consideration of their views, and it is hoped that with a full reply to these circulars the executive committee will be enabled to move in the matter so that the Association will be most benefited thereby. It is proposed to make the Western State lines of New York and Pennsylvania the dividing line between the Eastern and Western divisions. Yours respectfully, F. S. RATHBUN, Commodore A. C. A.

[COPY OF CIRCULAR.]

DESERONTO, Ont., Sept. 7, 1885.—Dear Sir: It has long been apparent to all who have watched the rapid spread of canoeing from the vicinity of New York, first to the north and east, and then to the west, that it would be impossible to cover so great an extent of territory by one meet at any point, however central. The advantages of unity are well shown by the rapid growth of canoeing under the influence of the Association, as, after ten years of hard work on the part of a number of individuals, it hardly obtained a foothold in this country, while five years under the care of the Association has put it in the foremost rank of outdoor sports. There is no doubt that some organization is necessary in the West, and we have had this matter brought to our notice by several members of the A. C. A. taking part in a meet held at Ballast Island in July last. We would respectfully ask you to fill up the replies to the questions asked on the inclosed sheet, so as to enable the executive committee at their approaching meeting to carefully consider all the points in connection therewith and to decide what steps, if any, are necessary to be taken. It is the earnest desire of the executive committee to meet the wishes of the Western members of the Association as far as possible, and we might add that the executive committee have been empowered to make such changes in the constitution and by-laws whereby a Western division of the Association may be formed, such division to hold its meets and elect its own officers (who will be members of the executive committee of the Association) and to have administration of its proportion of the funds of the Association, etc. It is hoped that a prompt and full reply will be given.—F. S. RATHBUN, Commodore A. C. A.

The reply requested is as follows: Give name, residence and association number; state if you are in favor of a western division of the American Canoe Association being formed; as it will be necessary if such change is made to elect officers over said division, will you kindly name the parties you would wish elected to the following positions, these officers to hold position until replaced by those elected at the annual meet of said division: Vice Commodore, Rear Commodore, Division Secretary-Treasurer. Please fill up the answers to the above questions and return at early convenience to F. S. RATHBUN, Deseronto, Can.

RACERS AND CRUISERS.

"SENECA" has mistaken our allusion, which did not refer to him but to another friend of the sneakbox, who after intimating a desire to race with a canoe, promptly declined the two acceptances of his challenge made by canoeists. The main question in dispute then was as to the ability of the canoe and sneakbox in rough water, which it was proposed to test by a race between them. The question can only be settled by a race, and we hope next season to see it decided. Of course a race of a few miles will not settle the question of cruising qualities, but if sailed in a breeze and under fair conditions, it will be a sufficient index of their respective merits.

Editor Forest and Stream:

I have just read "Seneca's" letter telling why he does not race, and while I do not propose to attempt the defense of the racers, who are quite able to take care of themselves, I beg permission to say a few words as to the value of canoes for other purposes which "Seneca" does not seem to appreciate. He admits that the craft which he says "can never be called canoes" are good enough "for sailing or paddling about a harbor of an afternoon." I wonder if it has occurred to him that there are a great many canoeists whose only chance for recreation, with the exception of ten days or two weeks vacation once a year, is just doing that same sailing or paddling around a harbor? That there are, is a fact, and I have no hesitation in saying that out of the number there is not one who would not be most happy to go to the woods and inland waters, and do all the beautiful things which he so nicely describes as being the only true canoeing. But if they are not fortunate enough to be able to do these things, are they therefore any the less canoeists? I think not. They have the true spirit, being simply denied the means of gratifying it. Their boats are made generally by the same builders, and are identically the same as used by the most persevering cruisers, with solitary exceptions. "Seneca" himself says, "I have cruised in sailing canoes of the best model of Nautilus, Shadow, Pearl and Sunbeam build, etc." Now, if that is true, he has been cruising in the best racing boats, which he afterward attempts to depreciate. But I started to give my reasons for liking a canoe for use around home. Previous to becoming a canoeist I owned and sailed several catboats and combined sailing and rowboats, and I am satisfied after three seasons' experience with a canoe that there is much more pleasure to be obtained from the latter for the following among other reasons:

Having the canoe housed when not in use is an immense advantage. It is protected from extremes of weather, either of heat or storms. Its bottom does not become foul and grass-grown, and it is always dry and ready for use.

It is an advantage when becalmed to have a boat which you can paddle pleasantly home instead of having to anchor and wait for a wind.

It enables one to be entirely independent. There are very few, if any, small boats which one can handle in a stiff breeze without assistance to ballast them. The canoe is much more under the control of the skillful sailor than a larger boat can possibly be, and with a boat of any where near its own size can always give a good account of itself.

Rowing will bear no comparison to paddling as a means of enjoyment. This needs no comment.

There are lots of nice fellows who own small boats who are as yet quite ignorant of the capabilities of canoes and who regard them as toy boats, fit only for little boys. The very best way to convince such of their error is to beat them in a fair sailing race, and in that way, at any rate, racing is useful. I hope no one will be discouraged, by reading "Seneca," from getting a canoe for "sailing and paddling around a harbor;" for I think it will well repay him to get one for that express purpose, in the amount of health and enjoyment he will derive from it. SURGE.

Editor Forest and Stream:

After "Seneca's" interesting letter, in a late number of the FOREST AND STREAM, in which he contrasts the uses of the canoe and sneakbox in a manner that has met the approval of many canoeists, I am sorry to see that he still holds the same views in regard to the American Canoe Association that he expressed some time since in your columns, that it is merely a gathering of "sporting men" bent on racing. As a cruiser he will himself easily comprehend how difficult it is to transfer to paper the many delightful features of cruising and camp life; how in most cases such a narrative runs into mere statistics of distances, etc., and what an inadequate idea they give of the many pleasures of an outdoor life in a canoe.

This, we take it, is why it is that the racing is the most prominent feature, both in accounts of the meets and in general discussion. The real charm, the glorious outdoor life, the fresh air, the green grass, the blue skies and the bright St. Lawrence, the hearty greeting of old friends met but once a year, the quiet evenings on the river or the long hours about the camp-fire, when song and laughter gradually give way to quiet converse in small groups, finally dying out to silence as the subtle influences of the midsummer night and the solitude of the wood or hilltop exert their influence over all; these things cannot be written down as a race can, but they are felt and enjoyed by every one who visits the camp. And yet a cruising canoeist who has never visited an A. C. A. meet, who mingles little with the members of the Association, who evidently comprehends little of its real character, disposes of us all by classing us as racing sharps, or, at best, "hotel cruisers."

The evolution of canoe racing, as pictured by "Seneca," will amuse a number of the older canoeists and racing men. I cannot claim quite so long a record as "Seneca," but I know quite well when and how racing here originated, I have seen all the racing canoes and known intimately their owners, and although they were nice fellows, they are by no means the class he pictures. I was first attracted to canoeing by the features "Seneca" champions so well, and I think I can lay claim to the "it" that even such a cruiser as he, though he feels it, cannot describe definitely; but I never fully realized what canoeing was until I heard at Lake George, in 1881, a racing man and cruiser, Ex-Commodore Longworth, speak in its praise. He described, as he could do, this same feature of canoeing in a manner that astonished and delighted even the old cruisers who listened to him, and taught them that even they knew little of the wonderful world only to be entered alone and armed with a double blade. Unfortunately the impromptu speech was never written down. "Seneca" was not there to hear it, and I doubt whether even he still realizes all the possibilities contained in such cruising.

Racing, properly regulated, as it is in the A. C. A., is the life and backbone of canoeing. I have watched and taken part in the growth of the sport from the ante-racing period when it was in the hands of a few cruising canoeists, down to this day, when it numbers thousands of adherents, and I can say that the growth and extension of canoeing, the improvements in boats and rigs, the possibility of obtaining all the small articles required even in cruising, the establishment of a literature devoted solely to the sport, and its general and favorable recognition as one of the best of outdoor sports, is coincident with the growth of racing. Who are the men who enter the races? Gibson, Weller, Vaux, Oliver, Rathbun, Van Deusen, Whitlock, West, Bailey, Munroe, each and every one a cruiser, while nearly all of them have added something of value to the canoe or its rig. Who are the men who make the improvements in canoes? From Baden-Powell, who wrote one of the first and most valuable books on cruising, and who made from the Rob Roy a really serviceable sailing craft, down to the novice who now and then hits a new idea, they are racing men. "Seneca" gives three instances of cruising canoeists, all well known. Macgregor has the credit of designing a perfect boat of its kind, of course, and of introducing canoeing, but what have the other two cruisers done? Bishop left the canoe as he found it, a very incomplete and imperfect craft, judged by the boats of to-day. "Nessmuk" is contented to cruise in the most primitive form of canoe, and has never made the least improvement in it.

Not one in twenty of the canoeists of America have the time for such cruises as "Seneca" and "Nessmuk" have done, and if they are limited to this form of canoeing only, they must cease to be canoeists. The average canoeist in New York, Philadelphia, Albany, Pittsburg, San Francisco, or other cities, must keep his canoe among wharves and docks and his time is limited to a few hours on Saturday afternoon, and perhaps to Sunday, with an evening at times during the week. How is he to enjoy sailing cruising in an outing of two or three hours? He may run off, as so many do, on Saturday afternoon for a ten or twenty mile trip, but near at hand is no suitable cruising ground. He can and does find a stretch for racing, and here he and his fellows meet once a week to try new gear and boats in a pleasant and healthful competition.

My first and most enjoyable cruising was done in a simple Rob Roy and to day I wish no better sport than to borrow the 50-lb Lark for a couple of days' outing, but I recognize fully that such a canoe is not fitted for my locality. Must I then take a sneakbox? I have no sympathy with the tandem canoeist or the "hotel cruiser." I sleep under canvas at all the meets and camps, and I am well contented to cruise my solitary way, as I have often done, but I know that there are many times when a few spare hours of an afternoon are very pleasantly filled by a race, I enjoy to the full the excitement and exhilaration of a hard fought battle, whether lost or won, and I like of an evening, when dozing over the fire, to look up at my walls and ceiling where flags and pennants bring back pleasant recollections of some rough battles, when I can hear again the heavy breath of some valorous competitor, pushing hard for a lead, or perhaps can see his silhouette in front as he crosses the line ahead. In my ten years' canoeing I have raced as far as my limited time allowed, but I have never won in the aggregate ten dollars' worth of prizes, though taking first or second place a fair number of times.

"Seneca" mentions the lead keel as a reproach to the Association. Can he mention any canoe on its list so fitted, or that could race under its rules? As to the tabernacle, it is only a wonder that so few cruisers have adopted it, as it is simple, cheap and easily constructed and allows the mast to be dropped to an inclined position when paddling. In my present location it is an absolute necessity, and if "Seneca" houses his cruiser above any of the bridges on the —— River, he would find it of good service too, unless the said bridges have changed since my time. The Lassie, the latest and fastest canoe in the New York C. C. fleet, has double centerboards; can "Seneca" say or prove that she is not, in model, weight and accommodation, a first-class cruising canoe? He objects to rudder, sails and other "complications" on a canoe, yet claims that his boat, which has these things, is a better sailing craft than the canoe. If they are so undesirable, why does he countenance such features?

I am willing to admit the excellence of his cruisers, but am not yet convinced of the truth of his assertion regarding Nautilus, Pearl and Sunbeam canoes. I contend that the general features of a canoe, narrow beam, both ends sharp, flat floor, good sheer and freeboard, partly decked, are found in the best surfboats, whaleboats and open water craft, and that for any purpose, from the lightest river cruising to coast and harbor sailing, this general type is better than anything of the square-sterned rowboat or catboat type. The Barnegat cruiser may be a better boat for rough water than an ordinary 15×30 canoe. I cannot say until the matter has been tried, but certainly the canoe is an excellent boat, and if used solely for such work might be enlarged as a "canoe yawl" like Cassy or Water Rat, according to local considerations.

It is a pity that "Seneca" declines to race, as he is so near New York that a match might easily be made, and would be very instructive. There are canoeists and canoeists, and before any one attempts to "read out of meeting" the great majority of those who consider themselves entitled to the name, he should make himself thoroughly familiar with their alleged offenses. JERSEY BLUE.

WHO IS "DEJA?"—A correspondent in Canada writes: "Who is 'Deja?' Is he really a correspondent or only a fellow called S— who is hoaxing the canoeists? I am inclined to the latter notion." Mr. Rushton writes us as follows: "Are you having fun with the boys, or is 'Deja' a live man. I have been much interested in the articles and have only been prevented by the feeling that maybe it was all a sell, from taking a hand in. The steel ribs and ⅛in. siding are what made me suspicious, for I certainly never heard of such a combination. Why don't you canoeists race with the sneakbox? Are you afraid to? I do not think that she can beat a good canoe, but she is a mighty safe, comfortable craft, as I found by using one on Cranberry Lake this August. Why not give her a chance, she will not hurt canoeing, will she? There are men who, like myself, cannot swim, and yet want to and will go on the water, perhaps to take their wives, and do not dare to trust a canoe, and a sneakbox is perfectly safe."

THE CONSTRUCTION OF "DEJA'S" BOAT.

WE had decided to publish nothing further relating to the controversy between "Deja" and the canoeists, but in answer to the request in the following letter and others of a similar tenor we publish a communication just received from "Deja," giving a description of his boat. If he was familiar with the rules and practical working of the A. C. A. he would know that keels are not prohibited, but that a limit has been fixed out of justice to those who cruise rather than race. While the keel is limited to 3in. the rule is capable of evasion, as the English rule was evaded in the No. 8 Nautilus, with 16in. draft, while the rule limited the keel to 2in. Such a boat, more shapely in appearance than "Deja's," could be built and raced under our rules, but no one cares to do it, though she would be very fast and able. The A. C. A. races are but a small part of the yearly meet and the inability to enter three or four each year need keep no man, especially a non-racer, out of the Association. If he comes to Grindstone with a first-class rig of any kind, whether outside the rules or not, he will find plenty who will race him every day. All A. C. A. men will heartily agree with "Deja's" remarks about racing for money. The Association has from the first set itself resolutely against racing for money prizes, and the leading racers can boast as clean a record in that respect as "Deja" himself. The American Canoe Association stands to-day on a fairer and higher plane as far as money racing and amateurs are concerned, than any similar body that we know of. Their definition of an amateur is more liberal, and their rules against racing for money are more strict than any other similar association.

Editor Forest and Stream:

I want to ask a favor of "Deja." Will he please explain fully the method of construction he hints at? It will no doubt interest many readers of the FOREST AND STREAM. Although, as "Deja" says, an amateur cannot hope to equal the work done by professional boat builders, yet there are those who take a delight in work of this kind, and to whom it is more in the nature of recreation than work. For the benefit of this class I hope "Deja" will give some instructions. Extreme lightness is an excellent quality in many small boats, and if ⅛in. siding is sufficient, it is folly to use ¼in. in boats which must frequently be carried around dams, etc. I have used this season for fishing and pleasure rowing a rowboat 12x34, weighing 60lbs. It is built of ⅛in. cedar, and I have been out in it 68 times, and rowed a total distance of 207 miles, an average of little more than 3 miles for each time out. Have landed on a lee shore where there was nothing but stones with the wind blowing a half gale, and yet the hull scarcely shows a scratch. I believe the boat would have stood the usage it got if the siding had been only 1/16in. in thickness. I hope "Deja" may not feel as though he had been "sat down upon" by any considerable portion of the readers of FOREST AND STREAM, and that we may hear more from him in the near future. F. A. LEOPOLD.

Editor Forest and Stream:

I think you sit down on me a little too severely; however, that is a natural consequence of having espoused the cause of the minority. The A. C. A., for reasons best known to itself, having resolved to keep keels out of its squadron, need not be surprised to find a new association coming to the front by and by.

In all my active participation, as sportsman, whether rowing canoeing or yachting received my attention, I have not lost or won a single cent. If any gentleman can exhibit a cleaner record than that he has the floor. For over twenty years as boy and man, I have sought to uphold a high standard in all national sports. I have never lost an opportunity, either in public or private, to deprecate the absurd habit of betting. It would be preferable to stop racing entirely if we cannot restrain the growing tendencies in this direction. It is a poor way to lose money. It is a despicable way to gain, because there is no limit to the tricks and meanness practiced by its votaries. Thrown its pursuit base ball and the turf have fallen into disrepute, and yachting, with its kindred amusements, is rapidly becoming a national disgrace.

"Didst ever see," asks Byron, in Beppo, my graceful little cutter? "For fear" you have "not, I'll describe it you exactly." She is 18ft. 1in. over all and 3ft. extreme beam. She has a deep rocker keel and flying light, that is, with nothing except her sailing gear on board, draws 19in. Her weight under like conditions, aside from ballast, is 207 pounds. The ballast is a "sliver of lead" bolted to the keel with quarter-inch copper bolts, three of them, and weighs, copper and all, 100 pounds. It "fills" the deepest part of the keel directly under the cockpit and the greatest beam—aft of the middle part of the boat about one-third—or two-thirds the length of the boat aft of the stem, the idea being to concentrate the weight as near the center of effort as possible. With two men weighing 140 pounds each she draws 21in. of water, and three men of average avoirdupois will set her down to 23in., beyond which she does not go easily. The keel, stem and sternpost are in one piece, having been "worked out" of a chestnut plank. The keel is 1ft. in average depth, 2in. wide on top and ¼in. thick on the bottom. The stem and sternposts are each 3in. wide and ¼in. thick inside. The stem is dressed off outside nearly one-half, and the steel shoe is drawn still finer from the steering hole to the waterline.

After this much of the work was ready a moulded form, representing the body of the boat, was screwed to the top of the keel with fifteen small copper screws, the exact size and length of which I have forgotten. The form is made of wood pulp and is seamless. It lines the boat and prevents any water coming in, so that the only way leaks are found is by the swelling of the wood outside. The lining is 16in. deep amidships and 19in at the ends. Including the "finish" put upon it the average thickness is about ⅛in. On the keel it is 3-16in. and along the underside there is a descending shoulder each side of the top of the keel, so that the latter sets tightly up in a groove thus purposely made for it. The greatest length of this lining is 12ft. The balance of the inside space is occupied by pressed tin air chambers, extending from the waterline to the deck. The ribs were next set up. They are of band steel, thirteen on each side, and rake aft instead of standing vertical. The degree of rake can be best understood by the average reader when informed that the widest rib extends from the mast section line on the deck to the extreme point of the stern at the deck, and the after air-chamber is held firmly in its place by rivets passing through the tin and steel. The forward air-chamber is secured to the ribbons on which the decks rest, as well as to the stern. Another steel ribbon stiffens the structure at the waterline and "catches" the garboard streak on the rudder well at the beginning of the overhang, where most semi-elliptical, overhanging sterns are weakest. This feature renders her as solid as such a structure can be made without adding greatly to weight.

What I have styled the main section is in reality the midship section, although it is placed aft of the latter point for reasons already mentioned. This shape of the body is also most conducive to speed—a long, fine entrance and a clean, concave run are indispensable requirements which cannot be united with suitable stability in any other form so acceptable to the water, which, at rest, is more easily parted by a gradually widening wedge than in the old form of "codfish head" and no tail at all. The strakes are white cedar an inch wide and one-eighth of an inch thick, except the first, or garboard strake, which covers in the joints where the lining, ribs and keel come together, and for the purpose of securing the greatest strength commensurate with the least weight as well as to establish the closest structural affinity attainable, the first strake is half an inch thick and two inches wide, the rabbet on the keel being an inch below the line laid off for jointing. The strakes extend full length and are riveted through the ribs and pulp with copper wire one sixteenth of an inch in diameter. The result is a stiff, light, stanch and buoyant little vessel capable of going almost anywhere, on or off soundings, and as seaworthy as it is possible to make a boat of her inches. The strakes are not lapped but reamed, and caulked with little "slivers" of cotton, each seam carefully flushed with gum shellac and sandpapered till the whole is as tight as a bottle and as smooth as polished steel. The slight tumble home of her sides has two advantages—dryer decks and increased strength. The outside depth is 2ft. 6in., length on loadline 11ft., rudder 6in. wide, beam on waterline 3ft. The decks are laid on steel beams spaced five inches apart. The steps are white pine half an inch wide and one eighth of an inch thick. Her spars were worked out of pine saplings and the sails are of Osnaburg. The spread for light weather is about 75yds., of which 34 is in the mainsail, 20 in the foresail and 15 in the largest jib.

One of the advantages of a double skin is that it prevents oxidization of the steel and copper used in construction, and one of its disadvantages is that it renders a boat too heavy for racing. Mine was built solely for cruising. I would lengthen the same lines to 17ft., without increasing the beam, or do as they have on the Clyde, where racing is the main feature, built from 19 to 20ft. on 5ft. beam, or about 3ft. extreme depth.

We extract from another of "Deja's" letters an account of the manner in which his boat stood for once only the test that as it are subjected to many times in a season. It speaks for itself as to one essential quality of the canoe, portability:

"It was the first, and shall be the last, time that my had been subjected to the humiliation of riding on a railway at to see what and traveling bags, and I was anxious to get her of let her lie while the effect had been. We shd her in from the pier when all was ready overhauling the rigging and my fishing tackle, which seemed to I discovered a slight leak around the stem handling incident to a have been strained a little by some of, some one of whom, no close acquaintance with baggage smashers, indestructible, weighdoubt, imagined her a representative of so called canoes. But in this nothing, go anywhere floating man canoeists have ruled her out and they were mistaken, for the last

denounced her as a yacht, because she requires water in order to float and wind whenever she sails.

"I find no fault with that, however, although she was designed as a sailing canoe, being too short, as I supposed, to be designated by the more dignified title.

"The stern was lifted out on the little wooden pier, and twenty minutes sufficed to find and caulk the leak. A thread of candle wicking was run into the seam with my penknife, and out of the storage locker came the means of paying off the seam. It was a half-pint can containing gum shellac dissolved in alcohol.

"The landing here is not a good one, although there is considerable gravel, for it is interspersed with sharp shells and rubble, to strike which might wrench the boat or break her keel, so both of us moved aft, I sitting well up on the deck of the overhang, and as we drew swiftly in let go the jib, which John clewed down with the downhaul, and finally dipped the peak. The peak halliard had not straightened out before we were grating the pebbles, and as the head settled into them we stopped, having grounded on an even keel with the rudder free in eighteen inches of water and the forefoot near enough to a large stone for us to step out with dry boots. That, of course, cannot always be done, but I have found that a landing can usually be effected, even on worse shores, by a little care, and even if the boat careens one good spring with the boathook secures a dry footing.

"While we were yet near the islands a couple of sailing canoes started across the bay, evidently to test each other's speed, and filling away after them we overhauled and passed them inside of half a mile. The wind seemed to be too heavy for them, as neither canoe—one a Racine Shadow and the other a Stella Maris—would stand up long. Sometimes they got knock-down puffs that looked like capsizing, and when they righted their decks were dripping, and generally a little bailing had to be done. We took water on board once only, which might have been avoided if I had huffed up sharp, but holding my course steadily the top of one large wave moistened things generally and made some of the fish think they were free again."

A "B" LINE FROM HUMBOLDT.

THE steamer City of Chester, plying regularly every Wednesday morning to the port of Eureka, on Humboldt Bay, found me, in company with a friend sometimes known as "Osculum," both armed with cameras and numerous "lightning" plates, among her passengers. The voyage up is not stalingly full of incident, and a cold, raw fog and keen N.W. wind did not add to the holiday aspect of the occasion nor was the regular blowing of the steamer's fog whistle conducive to good temper. By great good luck, though, we ran into clear weather in the course of the afternoon. As the weather cleared I could see blackfish spouting all about, while a small school of right whale porpoises, like animated rubber balls, bounded alongside.

After a night differing from other nights on shipboard only in the fact that the deck house, in which was our stateroom, had a rather greater capacity for squeaking and groaning than usual, we found ourselves off Humboldt Bar (200 miles from San Francisco), watching, with some interest, the movements of a large tug inside the unbroken wall of foam before us. This was our pilot, and guided by her movements and following close in her wake the Chester plunged through the surf. I should have enjoyed this more if the officers hadn't seen fit to order us all into staterooms and saloons; an order which I bitterly resented, though it is frequently necessary to save careless or inexperienced passengers from injury from breaking seas.

As there wasn't time to convince the Captain that I was entitled to a deck passage on this occasion, Osculum and I did the best we could with a stateroom window. How it was on the other side of the ship I don't know (I heard they shipped one sea over the quarter), but from our outlook nothing was to be seen but white water, and I am convinced that when the Bar really gets up for business there is nothing for anybody to do but to wait till it gets through, and those who are out stay out and those who are in stay in.

As we ran in we saw what seemed a schooner at anchor, but presently perceived that she was hard and fast. Some months ago, it seems, she was being towed in, and, running ahead on a big sea, carried the towline foul of the tug's screw. To save herself the tug cut her adrift and let her go ashore, and there she remains; while the tug people and the owners fight it out in the courts. If they don't have very bad weather the chances are about even that the current buries her, or takes a shot, digs a new channel and floats her. At present one can walk around her at low water.

Being utter strangers in Eureka, we took the advice of a parson aboard and put up at the Bay Hotel. We were, of course, taken for drummers, partly because of our camera cases and considerably because in this part of the world scarcely any one travels by sea for pleasure.

Sallying forth to see the town, we fell upon a gentleman who drew so enticing a picture of the doings of the wood choppers and bull punchers "up in the redwoods" that Osculum was fain to go there. As for me I said nothing until we were tossing back to the hotel, when I proposed to him that as I had come over 200 miles to be able to answer in some sort an inquiry about the place, we had better divide our forces, and while he investigated the habits of the stalwart logger I would gently glide (as being more in accord with my greater age and higher forehead) over the rippling waters of the bay and we should thus be able, by dividing our labors, to double the amount of our information.

A fog threatened next morning to interfere with my plans, but by 9 A. M. it had cleared away, so seizing the "sample case" I sallied forth in search of the picturesque, spending the time until luncheon snapping away in all directions, hoping that some one of the shots might be a good one. "Boats to let" next caught my eye, and approaching the establishment to which the sign pertained, I caught sight of a little catboat which had attracted my attention as we came into port. I soon finished the lunch business, left my traps at the hotel, and shortly found myself the proprietor of the Bonita for the afternoon.

Being an utter stranger I didn't ask any questions, but just sailed out to find out for myself how things were. It was the top of high water, which necessitated caution, as getting aground might mean staying there until all hours, and I had no fancy for that. There was a breeze that just heeled her down to her planksheer occasionally, everything about the boat was in good order (a mighty rare thing in these small seaports, I've found), and I just let her slide. I sailed in every direction the land would let me, and it seemed as if I had a fair wind no matter where I went. They must have laid out the land with reference to the wind; it's the best arranged sheet of water I ever saw. The view of Eureka from the bay is charming, the houses clumped together among a fair showing of trees and backed up by a range of mountains, clothed with towering redwood, pine, etc., while above all floated the grandest arrangement of white clouds you ever saw, with torrents of smoke pouring from forest fires, mingling with and tinging them a glorious copper tone. How I wished for a picture of it all, but my "change box" was empty and there was no chance of loading it until nightfall. Besides, I was rather nervous about trying to manage a camera and a catboat at the same time on a strange sheet of water. I blessed Osculum for leaving me in the lurch, and took as good a picture of it to "hang on memory's wall" as persistent gazing would give me. Then I went over and took a look at Arcata (six miles) and thought it looked better, if anything, than Eureka, and then I went somewhere else and then I went nowhere. In fact, I just dawdled all over that bay, coming about when the fancy took me, going now here in particular and having a glorious time, sometimes warned by dragging water that I'd better get out of that, and anon looking to windward to see if that little puff meant mischief or was only in fun. Taking it by and large, I don't believe there's a jollier sheet of water in the world for small boats, and I was told the woods about sheltered plenty of game, the water was full of fish, and in the season ducks were numerous.

Osculum came along in a wheelbarrow boat towing a barge about 6 o'clock, so I put up the Bonita and hurried to unload at him, giving it to him for going off and missing such a glorious sail; but he seemed to have been having a pretty good sort of a time himself. We took a stroll after dinner (supper they call it here) but O. was pretty well fagged, so we made it a short one, and after loading plate holders for the morrow, he turned in.

As the steamer sailed the next morning at 11 and O. was lazy and wouldn't get up until 9 we had to hurry to do all we intended, O. to take the lumberman's gorgeous mansion and a view of the town from its cupola (if he could get in) and I to get a picture of the Bonita. I received a warm welcome from Billy Brown, the boatman (I had hired the boat of his wife the day before) and he laid himself out, while I waited for the last vestiges of the morning fog to clear away (no honor to "the gentleman who had come clear from San Francisco to have a sail on Humboldt Bay." He deplored the lack of "skit-taste among the young people of Eureka, declaring that a could n's just as good for "them folks" as a "natty werry," and I really see sympathize with him when he mentioned his prices; it cost no cheaper to hire a boat of him than stay ashore and the Billy Brown-father. By the time we had grouped the boats and came along and "ily, and got a couple of shots at them, Osculum and a promise of out for the hotel, after an affectionate farewell had been fortunate part to send some pictures of the Bonita if I certain.

The sea on the bar was "snap shot" business I find is so mighty un- we were not therefore lookso heavy as the day we came in and forward deck, an order I was up, though we were ordered off the foremast with a hand on a topsful to disobey, hiding behind the aloft in short order if any green wsheet or something, ready to go but it does sometimes. Once a drug came aboard. It didn't come, 't wouldn't be locked up, and when they got over the bar and had time to look for him they found him jammed under one of the seats by the rail, and if he hadn't caught there he would have gone overboard. Another time a sea caught a third officer and slammed him against something so hard that it literally knocked the top of his head off. The bar is all right, but it won't stand any foolishness and is not adapted for canoeing; the bay is.

I tried to get a shot at the lighthouse as we passed out, but I guess it was too far off; at any rate I didn't get it, nor anything else but a spoiled plate. Too much spray in the air, maybe. The lighthouse steamer Manzanita, which left San Francisco an hour or so before us, we found outside as we crossed out. She was too far out for us to see what she was doing; and a small steamer was off Eel River Bar trying to get in, but gave it up as we passed, and, blowing a long toot of resignation, sailed for Humboldt, twenty miles away.

The voyage down was devoid of special interest, except that it was mortal cold that afternoon and got warmer at night. There were not many passengers. People go to Humboldt, but don't care to leave it, apparently. Don't blame them; wouldn't mind living there myself. The Captain told us a rather curious incident in reference to the survey of the channel between Cape Mendocino and the outlying rocks. The recital was suggested by my asking if it were not thereabouts that the steamer Northerner, with so many lives, was lost, and where First Officer French distinguished himself by gallant devotion and lost his life. It was somewhere about '62, I think.

So many disasters had occurred in making the passage (en route to Oregon) that a careful survey of the channel was determined on. A tug was employed for some six months, I think, dragging and sounding, and they were on their last day's work. The bearings had all been noted and everything plotted ready for publication. Pretty much every one was below at dinner, and the tug slowly steaming along through the channel with a drag out for a final trial, when the lookout reported the drag foul. Examination revealed a rock with six feet of water on it, and so pointed that even in the roughest weather the sea never broke there, and for six months they had been waltzing all around it. It was like Cupple's "Sunken Rock," and in another day they would have been piloting all the steamers on the route on to it. As it was, the channel was declared too dangerous to be navigated, and a whistling buoy well off shore warns vessels to go outside the outer rocks. B.

THE ESTABLISHMENT OF A SENIOR CLASS.

Editor Forest and Stream:

Mr. Gibson's suggestion to form a senior class of sailors and paddlers in the A. C. A., embodied in the letter published in your issue of Oct. 22, is a capital one. The idea—making the races of interest to the many—has been never lost sight of by the officers of the Association, as modifications in rules each year will attest. The Record was suggested as a means of keeping up the interest to win as good a place as possible in every race, and to increase the number of contestants in all races. The one-man-in-one-canoe rule is in the interest of the many, by making it impossible for a man to win more than a very limited number of first prizes at any one meet. Mr. Gibson's letter sugges s rules which will prevent the winning of the races by the same men for several years, and the consequent retiring of many others from races in which their presence is desirable.

Mr. Gibson asks us to commit our ideas to paper. I can only lay claim to one idea in this matter, and perhaps that is but half a one. Mr. Gibson suggests four races won to class a man a senior. The amendments or new rules he would have acted on at once, so as to be in force at the next meet, presumably to help clear the field of men tolerably sure of winning. If my remembrance of the various races held by the A. C. A. since its birth is correct, there will be but two seniors in the A. C. A. next August, one paddler and one sailor. At the last two meets there have been some five or six men who have had about equal chances. The six Class B races sailed in two years have all been won by different men. Therefore I ask, would it not be better to make the total number three instead of four? If any racer is inclined to think that this is a little game on my part to get into the senior haven, I may add that the number would still have to be reduced one to admit me, as I have but two firsts to show. The senior rule would hold for the paddling races and the sailing races only I presume. The sailing paddling race, upset, hurry-scurry, and like events being open to all on even terms, with prizes to the winner, be he senior or not. Is this the intention? If not, I think it should be.

C. B. Vaux.

SPRINGFIELD. C. C. REGATTA.

THE Springfield C. C. held a very successful regatta on Oct. 17 on the Connecticut River. A little after noon the tug Owl came up from Hartford with Com. Jones, Mr. and Mrs. Parmele, A. W. Dodd and C. H. Forrest. At 2 P. M. the first race, open paddling was called, with five starters: Nereid, G. D. Pratt; Peconsic, John Bowles; Varuna, F. D. Foot; Vision, C. McKnight; Gracie, E. C. Knappe. Nereid led over the course, with Peconsic second. Mr. Pratt wins the club paddling badge for the second time.

The next race was a two-mile sailing race, seven entries: Venture, L. Q. Jones; Ibis, E. H. Barney; Sylph, Emil Knappe; Vision, A. W. Dodd; Gluck, John Bowles; Girofla, F. A. Nickerson; Girofle, C. H. McKnight. It was a beat down the river, Venture leading at the buoy and coming in ahead at the finish. The times were:

	Start.	Finish.	Actual.
Venture	2 19 15	2 53 10	33 46
Ibis	2 18 44	2 56 36	37 52
Sylph	2 19 13	2 58 48	39 35
Vision	2 18 57	2 58 21	39 24
Gluck	2 19 35	3 00 25	40 50
Girofla	2 19 00	3 01 17	42 17
Girofle	2 19 05	3 04 58	44 53

All but Girofle, which capsized just before the start, went in for the no ballast race that followed. Ibis led at the start, but Venture soon passed her and again won. The times were:

	Start.	Finish.	Actual.
Venture	3 15 50	3 32 28	16 48
Gluck	3 16 13	3 34 13	18 00
Sylph	3 16 31	3 34 40	18 09
Vision	3 15 34	3 34 00	18 26
Girofla	3 15 13	3 34 34	19 21
Ibis	3 15 04	3 34 25	19 21

The entries in the novices' race were: Varuna, F. D. Foot; Joie, C. W. Bliss, and Oahu, C. R. Forrest, of Hartford. Varuna was disabled by an accident to her rudder, and Oahu won in a very light breeze.

The tandem race brought out Pratt and Knappe, Jones and Dodd, and Bowles and McKnight. It was very close until near the turn, when Pratt and Knappe took the lead, but soon lost it, Bowles and McKnight finally winning. Com. Jones won the hand-paddling race, and McKnight won the standing race.

A CANOE AGAINST SAILING BOATS.—A race for a cup was sailed on the 13th inst. by the small boats of the Staten Island Athletic Club, consisting of the following: Oriole, G. H. Frieze; Josie, Lewis Morris; Social, F. L. Lippitt; Surge, H. O. Bailey. The Oriole and Social are each 14ft. long, and also 5ft. beam, the former centerboard, the latter keel. The Josie is 16ft. long and about 4ft. beam, with fixed iron centerboard. The Surge is a canoe built by Mr. W. P. Stephens, of West New Brighton, for the owner, and is of Sandy Hook model. The first three mentioned boats are all rigged with jib and mainsail, in addition to which the Social and Oriole carried spinnakers. The course was from the mouth of the Staten Island Kills round Robbin's Reef lighthouse, thence to and around a stakeboat anchored off Bayonne, and finish at the starting point. There was a good sailing breeze from the south'ard with smooth water except near Bayonne, where it was lumpy. The time of each boat was taken at the start and finish. The Social and Oriole started well to windward and turned the lighthouse first, followed by the Josie and Surge close together. The Surge soon after passed the Josie and maintained a slight lead down the wind to near the stakeboat, where, owing to some difficulty in recognizing it, the Josie sailed a more direct course and again took the lead. The Oriole and Social were greatly assisted on this part of the course by their spinnakers which were worked by the "crew," each boat except the Surge carrying captain and assistant, but all four turned the stakeboat within half a minute of each other. From this point to the finish was a beat to windward, and the Surge soon took the lead and kept increasing it, finishing 1min. ahead of the Josie, which was second, and winning the cup. There was no time allowance.

THE GUENN-SHARPIE RACE.—*Editor Forest and Stream:* I request that you correct your statement made in canoeing column of Oct. 22, that the race was called between the canoe Guenn and the sharpie. Finding the wind so light that my boat could not stem the tide at the finish of first round, I called to my opponent, then well on his second round, owned his boat the victor and the stakes lost. This statement is but just to a courteous and most gentlemanly competitor, whose handling of his boat was admirable and whom I hope to meet again and turn the tables on some time, sure in any event of a capital day's racing and a pleasant companion.—Guenn (Oct. 22, 1885). [Rev. Dr. Neide writes us that Mr. Whitlock has notified him that the sum of twenty-five dollars toward an international cup is at his disposal.]

THE BARNEGAT CRUISER.—Mr. Bishop has finished his tests of the new sneakbox to which he has given the above name, and the American Single-Handed Cruising Club has contracted with John D. Gifford, of Tom's River, for fifty 13 and 14ft. boats for its friends and members.

TWO AMATEUR CANOE BUILDERS.—We have received from Mr. T. X. Satterthwaite, of Muskegon, Mich., a photograph of two canoes built in the evenings of last winter by himself and friend from the directions in "Canoe and Boatbuilding for Amateurs." The lines are those of the Laloo, taken from the same work, and both canoes are fitted with balance lugs and full Nautilus reefing gear, as described therein. The photograph shows two very handsome boats, the planking being better than most professional work. The boats are built of Michigan white pine, copper-fastened. They cruised this summer on the Muskegon River. Both the builders were amateurs, entirely unacquainted with boatbuilding, and aided only by the book mentioned.

"SENECA'S" CRUISER.—*Editor Forest and Stream:* I didn't intend "Katrina" to understand that I wanted an "introduction" from him. He well knows that he doesn't need any. I meant, and said, I think, that I would be glad to give canoeists of "Katrina's" stamp, who brought me a card from Forest and Stream, a trial of my Barnegat cruiser. If "Katrina" will stop off at Rahway, N. J., on his next trip to New York, and go to the *Advocate* office, just across from the railroad station, I will show him the cruiser in a five minutes' walk from there, introduction or no introduction.—H. H. Soule ("Seneca").

A NEW CANOE CLUB IN CINCINNATI.—The Cincinnati C. C., only a few years ago one of the most prominent in the country, has entirely disappeared from the meets and from canoeing circles, and canoeing has been at a low ebb in Cincinnati for some time, a circumstance much to be regretted, as it was once the home of some of our best sailors. On Oct. 22 a new club was formed by some members of the Cin. Boat Club who are also canoeists. The organization is not yet complete, but there is good material for a club, and we may hope next year to see some more big lateens at the meet.

CANOEING AT KINGSTON.—The Royal Military College Boat Club has amalgamated with the canoe club, under the name of R. M. C. Canoe and Boat Club. The officers, elected last month, are: Commodore, Major Fairclough; Vice-Commodore, Sergt. Morrow; Rear Commodore, Corp. Henneker. The club now has nine canoes. The burgee is triangular, a red cross on white ground with crown in upper white square. A canoe race was sailed on Oct. 14, Sergt. Morrow winning.

A CURIOUS LITTLE CRAFT.—A boat that would delight the heart of "Deja" was lately launched at Sunderland, England, by Messrs. Dennes & Co. She is a little cutter 13ft. over all, 3ft. 2in. beam 3ft. 6in. draft, uncapsizable and unsinkable, with a closed well aft. She has sleeping room for one, oil stove and wash basin. On launching she was at once tested in some heavy squalls, and proved very able and weatherly. Her name is the Titwillow.

SAN FRANCISCO.—The Oakland C. C. are now in new quarters, and some new boats are expected next spring. The Mousquito fleet is still active.

HOWARD C. C.—This club held their fall regatta on Oct. 24 on the Charles River. A. G. Webster won the sailing race.

Yachting.

WHOSE WATERLOO?

(Concluded.)

WITH the above the evidence in support of my case is by no means exhausted. I hold and have always held:

That in regard to speed, type does not enter the problem at all.

That within the limits yet experimented upon, we may look for like speed under normal conditions of wind and water, through the entire range of type from one extreme to the other.

That no one type can be singled out as innately the fastest.

That, as between representations of the various types, success will crown the most perfect fashioning in itself, be the dimensions whatever they may.

The corollary to the foregoing definitions being, that no virtue whatever inheres to beam itself as a contributor to speed and that an addition to beam in no wise carries with it an increased opportunity for the production of speed.

Furthermore that no comparative value can be assigned to much or little beam, the value of beam depending altogether upon the individual shape of hull with which it is associated. What might be a beneficial or judicious amount of beam in one shape would be murdering the chances for speed in another. Hence inferences regarding speed built simply upon a consideration of beam in its single capacity, regardless of the shape, volume, etc., of the hull are so much idle tattle. No wonder then, that at this late day no two persons will agree upon just what is "the best proportion of beam to length." No such proportion exists. It will vary for each and every fashioning of hull. In consistency and harmony with the design as a whole, it may be imperative in one shape to reduce beam until the boat is pinched into the proverbial "plank on edge." And for the same reason it may be imperative in another shape to expand beam to the maximum until the boat assumes the likeness of a pancake.

But, in neither extreme, nor in any intermediate compromise, do the possibilities for speed under normal conditions depend upon the proportion which the beam bears to the length. Speed will be attained in strict conformity to the judgment shown in apportioning the various elements *to the particular beam selected*, and in all cases, of course, with the pertection displayed in *fairness of body*.

The correctness of these deductions is amply sustained by experience in yacht racing. It is only upon unreserved admission of these deductions that we can reconcile the otherwise inexplicable and impossible fact that the highest rate of speed has been shown by every type of yacht, from the wedgelike six-beam cutter Clara to the flattest and broadest of sloops and representatives of various intermediate proportions.

In illustration: A Puritan of more perfect form upon her own beam than a Genesta upon her own smaller beam will possess greater possibilities for speed. And the contrary just as well. A Genesta of more perfect form upon her small beam than a Puritan upon her larger beam will have within her design the more favorable chances.

So far, then, as a contest between a cutter and a sloop is concerned, the result will *not* be in accordance with their beam. Nor does their type enter into the problem at all. The result will hinge solely upon the relative perfection of form upon the beam chosen.

A well-shaped Puritan will beat a Genesta of less likely form. A well-shaped Genesta will beat a Puritan of less likely form. That is all there is to the contest between cutter and sloop on the score of speed in smooth water and good sailing breeze. Experience has, however, well established one fact in addition. The narrow boat can be driven through lumpy water to better advantage than the broad boat, since the clumsier hips and flatter floor of the latter meet with more violent opposition from the sea, from the effects of which a lean, wall-sided and heavier hull suffers less check to uninterrupted onward motion. In light and fickle winds accompanied by more or less swell, the greater angle of heel and greater weight of the narrow boat seem also to invest her with greater possibilities for speed than can be got from broader, lighter, stiffer forms. This has, however, not been so firmly established as yet, but that difference of opinion may rightfully exist.

All this upon the supposition that in point of mechanical features, all types are assumed on an equality.

Turning to the volume "Small Yachts," written last winter, I find the following from my pen, which covers the ground as above: "In view of the varied results of races during the past few years, it is more than ever convincing that far too much stress is laid upon mere type by itself when the question of speed is agitated, and that the clue to success should be sought in the most favorable selection of bulk and general symmetry of hull, let the cardinal dimensions be what they may. We have all seen square races won by cut and cut cutters, by half breeds with and without keel, and with a little of both, by orthodox light drafts of a past epoch, and by all kinds of go-betweens. Extensive and close observation will in the long run justify the view that all types within certain not well defined limits can be made to reach equally high rates of speed, though some will excel under certain conditions and others again under an opposite state of affairs. But it will ever be a losing game to pit against perfection of one type anything of another possessed of less correctness of form."

This declaration receives further strength from extraneous sources; for look at the recent international races as one may, in the language of the *Spirit of the Times*, "the net result is that both yachts are about equal in speed." The stability of my position is likewise insured by the performance of the six-beam Clara in the third or triangular match outside the Hook, when the Vice-Commodore's Cup was the bone of contention

The smaller class of singlestickers were represented by the thoroughbred Clara as one extreme, the Isis as a cutter of four beams, the Daphne as a modern compromise of the Puritan stripe with three beams to loadline, a little keel and outside lead with a centerboard dropping through and more than usual depth, and also the Athlon, a good and true sloop, though not as flat and sloal as the

trap of yore. Here we had first-rate examples of type from one extreme almost to the other, yet the position of the yachts at the finish had no connection with their individual proportions of beam to length. They arrived decidedly mixed as to beam. Clara, the narrowest of the lot, won, not *because* she was narrow, but because she had the *most perfect shape* on her beam. The rest were distanced, not *because* they rejoiced in *greater* beam, but because they were of *less perfect* fashioning upon whatever beam they happened to possess. *Beam, type*, were wholly foreign to the issue. *Perfection of model*, that is the best selection of displacement, the best entrance, the best clearance, the best ratio between resistance and sail area, the best balance of weight and turning centers, the best windward qualities, the "sweetest" lines, etc., etc., all or some of them were brought to a better average on Clara's beam than the same elements were made to effect in the other yachts of her class on the particular beams they happened to possess. Clara won in consequence, neither beam nor type having anything to do for or against her victory, as the course did not average enough rough water to bring out the special adaptability of small beam for such work. And, looking upon Puritan's victory as a victory really won upon merit instead of through luck, the same reasoning will apply. Her victory over Genesta was not due to the type she happened to represent, but because a more perfect vessel on her dimensions than Genesta is upon hers.

I have gone to some length in this matter, as the public in general has been led completely astray by the nonsensical rubbish in the daily papers. The lay critic could discover nothing in Puritan's victory but a vast fund of "conclusive proof" that the Puritan type was "all right" and the Genesta type "all wrong." Even admitting Puritan's victory to have been genuine, there was absolutely nothing shown in the international races upon which the Puritan type could be bolstered up into a golden calf to which we all should bow in servile imitation henceforth. Nor did the races supply any good reason why our English cousins should drop their favorite style of vessel and give up safe, able, speedy craft of the highest all-round performance, for the less reliable sloop and leaky centerboard contrivance, with her scanty accommodations below and her spray-soaking proclivities which render her almost unfit for family cruising, unless drifting in sheltered waters be the height of ambition to which a cruiser should aspire.

Type did not enter into the Puritan-Genesta races at all. There never was enough wind or sea to bring out their relative staying qualities. At most, the conclusion can be that Puritan was slightly more perfect on her dimensions than her foreign opponent. And that is no guarantee whatever that upon next meeting the representative of the cutter family may not turn the tables on our sloop, there being, according to the stand I have taken and explained above, *no innate sources of superiority in type* as speed under normal conditions is concerned, and so far as speed under trying conditions is concerned, the *innate superiority rests with the cutter* beyond any dispute.

The next international competition will be decided upon like grounds. If the Galatea is a vessel of more perfect mould on her dimensions than the sloop she will meet is on hers, then the America Cup may be expected to take wings for a long flight from our shores. If the reverse should be the case—if the sloop is ahead of Galatea in symmetry and the average of her components of performance, then the bold Briton will have to try again. If Galatea catches us in a cringle blow and chalkpit sea, then, unless Galatea is below the rest of her family, the cutter will make sport of any sloop we can ever produce.

In concluding this review one more influence which operated materially in favor of the Puritan ought not to be overlooked. Throughout the races the policy pursued by Puritan's pilot, Capt. Joe Ellsworth, was more commendable than the tactics aboard the cutter. Eddies and airs were worked to the Puritan's great advantage, while Genesta was rammed through everything, thick and thin, without displaying the same *finesse* in her handling.

Hasty and unwarrantable assumptions as to the bearing of these races upon modeling in the future are the natural accompaniment to the shiftless and superficial character of the newspaper reports of the matches themselves. The astute editorials forecasting an immense "revolution" in naval architecture were not the least funny among the many ludicrous fulminations of the landsmen contingent engaged in "flowery portraying" of the all-absorbing events. While the newsboys were crying the "Puritan's great victory" in the streets and gaping crowds hung round the bulletins to read dispatches composed by the office boy or janitor within the mysterious precints of the newspaper cellar, ye dashing editor up in the tenth story was making the ink fly with his sweeping prophecies. The bold, bad Britons were to stumble over themselves in their hurry to break up all their vessels and "adopt the American model" as depicted in the "wonderful" Puritan. The honest keel vessel was to be no more, either for sport or for trade, but flat-bottoms, centerboards and the what-nots of a country without a flag upon the high sea, were to dispel the darkness abroad and shed luminous intelligence upon the benighted Britisher, and teach Britannia, who rules the waves to our utter exclusion, how to go down to the sea in ships.

Like a thousand similar newspaper "revolutions," this last one failed to go off and the obstreperous John Bull has since signified his very clear purpose to stick to his honest vessel and try for the Cup again with the same kind of instrument as the Genesta, only a little more so.

There is no question but that Puritan can make a passage at sea in perfect safety, barring the loss of her long horn, and with some degree of comfort. That is all insured by her size alone, if by nothing else. There is also no doubt but that she can win occasional matches abroad in weather and water to her liking; but the Puritan and vessels of her type would for all that fail wretchedly in answering the purposes of the foreign yachtsmen. She cannot compare for reliability in all-round work with a yacht like the Genesta. She would fail to score in reefing breezes and she could not be counted upon to make forced passages around the British coast in all weathers. Of this the Englishman is perfectly well aware and the news of Puritan's performance is not likely to turn his head, as may be gathered from the correspondence which has appeared in the European press, and of which the following is a fair sample, taken from the London *Field*, Sept. 26:

"SIR—A letter appears in this week's issue of the *Field* which calls for a reply, displaying, as it does, a lamentable ignorance as to the merits of American sloops and English cutters, and 'C. J. W.,' in condemning the latter and praising the former, displays neither reason nor justice.

"Now, as to the points of the two types, I consider them to be as follows: Regarding the sloop, even including the 'half way between' Puritan, they in the hull are too shallow to go to windward in a jump of a sea, and, through the same cause, they are decidedly deficient in head room. They are too wide, in that a heavy sea causes a most unpleasant, uneasy motion, whether they take it end on or on the beam, preventing the sails from sleeping, and, to put it mildly, disturbing the crockery; while every roll, if on a wind, is a shove to leeward.

"As regards the sparring, the position of the mast is too far forward, in a rough sea, for comfort, speed, or even safety, increasing the pitching motion as it does. The great proportional length and weight of mast multiplies the above defects; and this, in addition to the comparative insignificance of the mainmast, precludes the possibility of snugging the vessel comfortably down and leaves her in a gale with a thundering big tree swaggering out of her.

"The mainsail is too large to handle easily, and compels the necessity of reefing when the cutter need only stow her topsail.

"Now, having so far judged the sloop—which after all is only a fine-weather, smooth-water boat—let us glance at the cutter. I cannot admit our large cutters are deficient in accommodation through want of beam. An old saying speaks of matters of equal merit as being as "broad as long." Length is as good as breadth, and, in a vessel, better. The cutter's merits are in exact contradiction to the demerits of the sloop. Her hull formation is adapted for bad weather and broken water, &c., and it is absurd to speak of her uncomfortable motion, for nothing is designed at present so easy, gradual and comparatively free from rolling, pitching and scending. As to her spar and sail plan, is any one bold enough to say it is not the best for speed, weatherliness or comfort in a single masted vessel as yet designed?

"Now, as to the late racing in America, Genesta is the natural outcome of a system of measurement, admittedly having its faults but still a measurement that has produced the most able and weatherly of vessels, while Puritan is the outcome of a different system, fostering a different type. It is hard to bring those two types together, but it might have been more reasonable if they had been measured by a rule midway between the Y. R. A. and American.

"To conclude, would Puritan have won from Genesta if the vessels were raced under the conditions of measurement, wind and water under which the latter was built to compete? Would Puritan make a passage in comfort and safety in what we consider bad weather?

"In a matter of speed alone would Puritan have sailed even knot for knot with Genesta in weather such as was experienced by Genesta's sisters at the late Dartmouth regatta?

"I have resided in the United States and know their sloops and schooners, and I know equally well the English cutter, and, in my opinion, the only answer to the foregoing questions is a very big 'No!'

"JAMES J. HOUMAN."

The London *Field* also coincides with the limitations I have above set to the utility of a Puritan in British waters in the following taken from an editorial in the *Field*; "So far as the contention that the English type of yacht is wrong is concerned, we feel sure that the American type will never, even in the Anglo-American type represented by the Puritan, be adopted in English waters.... The conclusion to arrive at is that a compromise between the sloop and the cutter must be very much more cutter than even Puritan is to compete with anything like success against British yachts in a whole sail breeze."

Surely the above settles the "revolution" in British yacht building, which has been impending only in the minds of persons not familiar with the conditions of yachting abroad. Past history furnishes another striking illustration of how easily the average critic slips off his base in the hour of exuberant spirits. The America in her day "created" a furore in yachting circles to which the recent international races compare only as a small side show. Now while the America hastened the universal introduction of long, fine bows and flat sails, both these attributes were not new, for they had been anticipated in British yachts like the Mosquito several years before the advent of the schooner from these waters, and they were, moreover, subjects of universal discussion at the time, the leading lights abroad having given in their adhesion to the innovations before the America was ever thought of. To what extent did the British throw their own experience to the dogs and at a bound reconstruct their fleets by a fresh lot of Americas? Just one single, solitary schooner yacht was built after the America's lines, and that was the iron-hulled Vestal. She performed fairly well, but was not raced with much earnest. The British set about remodelling their modern fleet by the regular process of evolution, leading up to the Cambrias and Lyonnias, with which we are well acquainted. They did not discover any cause for a "revolution" in the America and she never set the fashion to the lights who came to the fore after that schooner's achievements had become a matter of history. It is nonsense, then, to suppose that an event of comparatively minor importance can draw in its wake a more violent upsetting of prevailing preferences and experience abroad. On the contrary, the British public are aware that while short twelve years ago their yachts were still manifestly inferior to our own in speed, they have, by following out their own line of experimentation, so far progressed as to send across a Genesta, and prove her practically as good as anything we can produce. They have the satisfaction of knowing that but for our borrowing from them the cutter's rig and the cutter's equipment, our orthodox sloops would have been easily beaten. Is it likely that with the indorsement of their ideas and practices in the Puritan, and with full knowledge that even the Puritan would fail to meet their wants, they will discard principles which have been well tried abroad and to which even we are giving our approval? There need be no fear that the sturdy British yachtsman will ever discard his bold, able and ever reliable little seagoing vessel for a makeshift, a half-hearted cross between sloop and cutter like the Puritan. If he did, very little further experience would convince him of his error and he would turn to his old love with all the better appreciation of her grand qualities and incomparable all-round excellence.

So far as British yachtbuilding of the future is concerned, the Puritan-Genesta races will be devoid of the slightest influence. A change in the Y. R. A. tonnage rule, which now handicaps beam so heavily, may possibly induce a trifling addition to beam for the sake of greater deck room and accommodations, but such additions will be purely nominal in extent and still leave the type unmodified. The London *Field* echos the experience with beam about the British coast and my own as well when it says:

"So far as regards altering the rule, before that is done we should like to see if a yacht of 45½ beams, 80ft. on the loadline, could not be built to live in close about 5½ beams, on the same length. We think the experiment quite worth trying, though there is not much chance of its succeeding in the small classes. Such yachts would have 2ft. more beam than Genesta (that is, 17ft.), and would have to allow her 1min. 6sec. over a 50-mile course. This penalty does not look more than she ought to be able to do; and adding 2ft. to such a craft as Genesta would make her in many ways a very much improved vessel, and especially in a seaway, although occasionally there may be a particular kind of sea met with which the narrower boat would get through the faster. Examples of this have occurred over and over again in yachting experiences, and they have rather tended to mask the fact that for any given tonnage a yacht is not always what may be termed sufficient performer in a sea simply because she is narrow, but because she is long and deep. If, however, a yacht has a beam much in excess of two-tenths of her length on loadline, the beam will begin to tell against her in a head sea, but she will not necessarily be a bad sea boat."

That is to say, the *Field* does not think that experience warrants greater beam in small cutters. Probably because such yachts need a maximum displacement to go through the exceedingly severe racing and the bad weather they often have to face owing to their small size. But in larger vessels, as the Genesta, an addition of 2ft, might be an improvement except in the worst of weathers. Allowing the *Field's* assumption to be correctly taken, the Genesta would even then remain a 5 beam cutter, or a very narrow boat according to our American notions. This, however, would be brought about by a change in the measurement rule without reference to the Puritan's success at all. To such changes, I and all other "cutter men" certainly make no objection. We are quite willing to abide by the outcome of experience in respect to cutters of moderate beam, narrow beam, very narrow beam, or no beam at all, just so the world shall not be cheated out of the sturdy cutter type through fallacious deductions circulated by inexperienced persons who force their "beliefs," "views," etc., upon the public at a rate inverse to their right to give an opinion of any kind.

Turning now to the probable influence of the international races upon yacht building in America, I am forced to conclude that their effect will be the very reverse of what has been predicted. Being more volatile in character than John Bull, Jonathan will rush headlong into copying without turning things over in his mind. Very well. Let him copy. Inasmuch as Puritan is a half-way step between sloop and cutter in her rig, equipment, stowage of ballast and appearance, Jonathan will simply be discarding his last century trap and taking his first lesson in cutter principles. This will be satisfactory to himself, for he will get a better style of boat than he had before. It is also satisfactory to "cutter men," because having "been there themselves," they think they know where Jonathan is sure to bring up. The next Puritan may have all her lead outside. This involves a keel of such depth that the centerboard will be discarded. Jonathan will follow her up in all the rest of his vessels, and presto, change! before he is aware of it he is backing the cutter of moderate beam against all creation. The rest will take care of itself. With all the weight hung low, Jonathan will wish to beat all comers in all weather, and he will whittle off just a little bit of that lumpy beam and fill in the amount about the floor to drive his vessel through a head sea; and so it may come true some fine day that Jonathan is the man who has got "cutter on the brain," and old-fashioned John Bull insists at least upon enough beam to squeeze his fat anatomy down the companionhatches.

Thus it is that no matter what interpretation be put upon the Puritan-Genesta affair, the "cutter men" are in high glee, for more "cuttery" our fleet is destined to become. The "cutter man" no longer lacks confidence in his favorite type for speed. Genesta, Clara and even Puritan are living witnesses in behalf of the soundness of cutter principles. Formerly he may have built with an idea that he was sacrificing speed in return for the comforts, dryness, ease, accommodations below, cool cabins and all-round reliability, in all of which he knows the cutter to excel. Now he will build in full knowledge that there is nothing inherent in his favorite type not compatible with the highest rate of speed, and that there is nothing inherent in the sloop which entitles her to claim greater possibilities in that respect.

C. P. KUNHARDT.

GENESTA AND GRACIE.

Editor Forest and Stream:

In your last issue "Reader" furnishes his own answer. My statement concerning Genesta and Gracie as compared to Puritan and Gracie was based upon the triangular races the two pairs sailed, as no comparison can be instituted between a race to windward and one over a different course. Puritan and Gracie sailed 40 miles triangular course. Puritan beat Gracie 25m. 8s. Genesta and Gracie sailed triangular course, 32 miles. Genesta beat Gracie 31m. 32s. Add one-quarter for difference in distance, and Genesta beats Gracie 27m. 20s., making my statement correct. The time in Puritan-Gracie race represents also much less distance, as it was sailed in lighter wind. I am ready to grant, however, that the comparison is of no great value in any case, as accurate deductions cannot be reached in the premises.

As for the item in *Science*, mentioned by "Reader," it is on a par with the rest of the slipshod observations in other publications. For one thing dipping bowsprits is no criterion whatever of seagoing qualities, least of all of ability. Puritan's bowsprit has a steeve or rise upward, Genesta's is bubbled down, and every one concedes that cutters oscillate through greater arcs than vessels of flatter floor. It is a perfectly harmless peculiarity scarcely noticed by those on board. I have sailed in a 50-mile gale in a cutter which dipped her bowsprit at every dive, yet she shipped next to no water nor threw any spray in comparison to what a sloop would do under the circumstances, even without dipping bowsprit at all.

The beating which Puritan gave Bedouin was due *wholly* on account of Puritan's bigger size, for Puritan beat the sloop Gracie *much worse* in the first trial race referred to. Hence any reasoning which attempts to lay Bedouin's defeat at the doors of her model is rubbish which ought never to find its way into a publication of high standing. If the cutter model was at fault in that race, then the sloop model of the Gracie was even much more faulty. Gauged through the Gracie, Genesta, a cutter herself, could beat Bedouin in the stiff breeze at sea of the first trial match just about as badly. The value of size in rough weather has heretofore been underrated and this is what the Puritan-Bedouin race really disclosed. Inasmuch as the cutter Bedouin beat the sloop Gracie of same length no less than 29m. 55s. in twenty miles to windward, the race very clearly established the vast superiority of the cutter in coarse weather, just the contrary what "Reader's" quotation from the *Science* would imply. This point has been so firmly established upon hundreds of occasions, here and abroad, that it would in any event require much more than one race the other way to set up the contrary.

The Puritan races are not the only contests between different types which have taken place. They are only one lot out of hundreds of similar competitions. To look to the Puritan races alone, and disregard all other lessons is an absurdity quite the fashion for the present. The English have for years and years experimented with beam from the broadest down to the narrowest, with innumerable yachts differing inch by inch. The general result is heavily in favor of narrower vessels than our sloop for reliability, ability and speed in heavy weather, nor has anything transpired since the appearance of the Puritan to shake confidence in previous observations. Those qualified to judge do not hesitate to go on record strongly in favor of Genesta and her kind against boats of Puritan's build, and much more so against the typical American sloop which is notoriously worthless in a sea, so far as "going" and "dryness" are concerned. No yachtsman familiar with Gracie, Fanny, Mischief and their class will pretend that they can be "driven" under reefs in an ugly sea. But it is equally familiar to all who have experience in cutters that that is their strong point. Under short sail they do relatively much better than the sloop, and the cutter can thrash a good passage and claw out to windward long after the sloop has to give up through sheer inability to accomplish anything to her good. In large yachts this is not of such great importance, as they are in heavy weather less often than small vessels, and mere size is an antidote to shortcomings in model. Hence "cutter principles" have all the more direct application to yachts of small tonnage, if such yachts are to be put to hard service and not rest forever content with small work in sheltered waters. The future is certain to see the ten and twenty ton yacht knock about our coast just as much as is the custom abroad, and to that end she must and will approach the British cutter in her conception. I am only one out of thousands who would rather cruise to the West Indies, to Bermuda or to the Gulf of St. Lawrence in a 50ft. yacht than in a huge ark aboard which I could only be a passenger or figure almost as a nonentity in her handling.

C. P. K.

COMMENDATORY reviews of Mr. Kunhardt's "Small Yachts" are the rule. *The Nation* says: "This book fills a blank in American yacht literature, and will be found a valuable addition to the libraries of our American yachtsmen. The subject-matter, although covered in a measure by such works as Dixon Kemp's 'Yacht Designing' and his 'Yacht and Boat Sailing,' is presented in more attractive form, is much condensed, and is procurable at less than half the cost of those volumes. It is practical throughout—practical in the treatment of what is popularly called theoretical; and the chapters on Resistance, Displacement, Stability, Beam and its Relations, make plain the course of the amateur designer when he launches his ship on the drawing-board with his tools and the assistance of the chapter following on Computations, which is also presented in the simplest possible form. The yachtsman who understands the principles of design and their results, derives much more satisfaction from one of the manliest of sports than the man who is willing to sail a passenger in his own ship, and is content to pay for all professional services; and hence we can recommend the book, notwithstanding its title, 'Small Yachts,' to all yachtsmen, without reference to the size of their vessels, existing or in prospect. Under the head of General Information the reader will find such subjects as Yachts' Papers, International Rules of the Road, Cautionary Signals of the U. S. Signal Service, together with many useful tables, such as weights of materials, gear, wind pressure, etc., etc. A large portion of the book is devoted to the lines of many existing small yachts, with sail plans, plans of accommodation, specifications of construction, and general description, which will be found of much interest; and the classification by type, with remarks on the features of each, has a wholesome tendency in the direction of an uncapsizable boat (unlike the yacht Torpedo, which recently capsized and drowned three of her crew). This classification is as follows: Centerboard catboats, keel catboats, light draft centerboard sloops, light draft keel yachts, deep draft keel yachts, compromise keel and centerboard, beamy cutters, cutters of moderate beam, cutters of small beam, and yachts of special class, embracing sharpies, buckeyes, canoes, etc.

THE PROPER MODEL FOR FISHING VESSELS.—Captain Collins has for some time been urging a change of the model of American fishing vessels. The most important feature is indicated in his note in the Cape Ann *Advertiser* of May 19, 1882, as follows: "All evidence goes to prove that in the open ocean, especially where strong winds and rough seas are to be encountered, deep bodied vessels are much more rapid than shallow ones. Nor does this depend so much on the vessel carrying a great amount of sail as it does on her ability to keep on her course and make headway under short canvas when one of less depth, though of broader beam, must heave to and drift to leeward." These statements have been verified in a very interesting way the past summer by the Gloucester vessels sent to Iceland on halibut voyages, where they came in contact with English smacks. Captain George W. Pendleton, master of schooner Alice M. Williams, which is one of the best Gloucester vessels, reported that on the day he sailed from Iceland he encountered a gale and was obliged to heave to under double-reefed foresail when some 40 miles off land. Soon after he heaved to he was passed by an English smack, carrying a single-reefed mainsail and whole foresails. He thought the English vessel was making 11 knots an hour. Everything was dry and comfortable, the men appearing on deck without oiled clothes. On other occasions he was obliged to reef down snugly while the English smacks went along comfortably under all plain sail. The Alice M. Williams was deep in water, as she had a full cargo of fish on board, and yet was compelled to lay to while another vessel no larger was moving comfortably under crowded canvas.—*Report of Commissioner of Fisheries (Sept. 25, 1884).*

NEW YORK Y. C.—A meeting was held at the club house on Thursday last, being a continuation of the adjourned meeting of July 23. On its adjournment the fifth general meeting was at once called to order by Rear Commodore F. C. Lawrence. Resolutions of respect to the late ex Commodore W. H. Thomas were passed, and also a resolution offered by Mr. A. P. Stokes, schooner Clytie, thanking the owners of the Gracie and Bedouin for their action in entering their yachts in the trial races, as requested by the committee. Ex-Commodore Smith moved that a committee of seven be appointed by the chair to select a suitable piece of silverware to be presented to the owners of the Puritan as a recognition of their action in the defense of the America Cup. Mr. Phillip Schuyler also moved that the thanks of the club be presented to them. Both resolutions were carried. Mr. Webb's letter of Oct. 6 in regard to a continuance of Galatea's challenge was read. The secretary was instructed to inform him that the club would consider when received, any formal challenge in the name of a yacht club, as stipulated in the deed of gift. Vice-Commodore Douglass offered his resignation, owing to a proposed absence abroad, but it was laid on the table. After some miscellaneous business the following new members were elected: Sir Richard Sutton (honorary member), William L. Stow, John W. Emerson, Gilbert Schroeder, Benjamin J. Swan, Charles T. Minton, Edward C. Post, J. Moss White, L. D. Shephard, Fred. Gallatin, Arthur Ryerson, Thornton N. Motley, John W. Handren, Charles L. Wright, Geo. H. Draper, T. Harrison Garrett, John R. Andrews, William C. Eustis, T. Henry French, W. H. Higbee and G. E. Stevens.

OBSTRUCTIONS IN THE EAST RIVER.—The following notice has been issued by the coast survey office: Lieut. John M. Hawley, U.S.N., assistant U. S. Coast and Geodetic Survey, commanding the schooner Eagre, has developed the following additional dangers not heretofore shown on the charts of this office: 1. A small rocky shoal lies about midway between the southwestern end of Blackwell's Island and black buoy No. 30. The rock has but 2½ft. of water over it, and is located on the following bearings, taken from Coast and Geodetic Survey Chart No. 369, 3: Smallpox Hospital, Blackwell's Island, N.E., 485 yards; Canoe Rock (center of rock), S.W.¼W., 270 yards; Forty-fifth street, New York, N.W.¾W., 470 yards. This rock, being part of the line of detached ledges forming Blackwell's Island reef, is not in the track of vessels following the usual channels. 2. A ridge lies to the eastward of Blackwell's Island reef, nearly in mid-channel, and has a least depth of 18ft. over it. It extends about 40 yards in a north and south direction, and is located in the following bearings: Smallpox hospital, Blackwell's Island, N.N.E.½E., 830 yards; Long Island railroad sign, Hunter's Point, S. by E.¾E., 405 yards; Canoe Rock (center of rock), N.W.¾N., 240 yards. To avoid this ridge vessels passing to the eastward of Canoe Rock should hug the Long Island shore.

A HINT ABOUT CHAIN.—A short time since a yacht went ashore in a blow, parting her chain, a new and apparently good one. An examination of the broken link showed, however, that the cause of its breaking was that being very wide, it had turned half round and kinked so that the adjoining links pulled on it sideways, a direction in which it could stand little strain. Chain which is tested and found defective in England is not allowed to be sold under heavy penalties, but it is returned after testing to the owner. What becomes of it? There is no law against exporting it or selling it in this country. Does any of it come here?

YACHTING NOTES.—Sir. Richard Sutton's schooner Elmina, 350 tons, has lately replaced her old masts with new ones and is now fitting out for a cruise to Suakim. ..The Amy, 842 tons, Mr. N. B. Stewart's new steam yacht, is also fitting out for a cruise to Madeira and the West Indies. She has proved herself remarkably fast this season ....The 30ft. length class boat Curtsy, Major Forster, has made a good record this season, racing 30 times and winning 23 firsts, one second, and also leading in three other races in which she was disqualified as being over length ..The sloop Genia has been sold to Dr. Mandeville, of Newark, N. J.....Intrepid, schooner, is laid up at Sixth street and Nixzie L., foot, at Seventh street, South Brooklyn. ...In Manning's Basin is the sloop Winona, lately returned from a long cruise on the Lakes....Enterprise and Crocodile were lately laid up in the Atlantic Basin ...Mr. Fairman Rogers's steam yacht Magnolia has lately been completely overhauled by Herreshoff and will leave shortly on another cruise to Florida,...Oneagh, schooner, is reported as sold to an American, Mr. Harvey Spencer .. Dauntless, schooner, has been at Poillon's for a general overhauling preparatory to a winter cruise....The Boston Y. C. has purchased the land and shop formerly belonging to Pierce, at City Point ..Smith has hauled up at his yard in South Boston Volante, Nautilus, schooner; Alcyone Cygnet, Juno and Esther....Gitana, schooner, is hauled up at Mystic wharf, where she will be lengthened forward....Corsair, steam yacht, is laid up in the Erie Basin, where she will be completely refitted below. Atalanta is also in the Erie Basin ....Sagitta, sloop, which was ashore off Fire Island last month, is now hauled up at Islip for a general overhauling . Montauk will lay up this year at New London....At Seventh street, South Brooklyn, are the steam yachts Day Dream and Norma....Bertie, sloop, is laid up in Mumm's Basin....New Haven—Ariadne will lay up at Huntington, L. I., Wild Duck at Portchester, Rival at Westport, Thistle at Greenport. Trio at Middletown, Viking at Groton, Viola at Stony Creek, Flora at Brantford, Sophia and Nereid at Norwich, most of the others of the fleet will winter at New Haven....Rajah, Stranger, Endeavor, Roamer and a few others are still in commission.

KNICKERBOCKER Y. C.—A meeting of the Knickerbocker Y. C. was held on Oct. 23 to present the prizes won in the late fall regatta. Much dissatisfaction has been felt in regard to the timing of the race, which was to be sailed within six hours. The time announced by the judges was a few seconds under the limit, but as timed by a number of responsible parties, both on the boats and at the clubhouse, it was 6h. and 7min. Since the race the matter has been much talked of, as there seemed to be no doubt but that the official time was incorrect, and by the club rules there had been no race. Commodore Hobby presided at the meeting. Objection was made to the awarding of the prizes and evidence was offered to prove that the time was incorrect. The Regatta Committee declined to question the time given by the judges; one of the latter, Mr. W. J. Parker, declined to give any decision, and the remaining two, Messrs Jackson and Deane, declared that the race must stand, so the prizes were finally presented. One of the winners—Mr. Smith, of the Rosetta A. —said, on receiving his prize: "Gentlemen, I accept this prize, but with no pleasure whatever, as I believe there was no race." The prizes were awarded to Surf in the first class, Lena second, Lizzie R. third, Rosetta A. fourth, Maggie fifth, Hornet sixth, Bon Ton seventh, Vaddie eighth. The steam launch prize was won by Mystic. Lizzie R. won the pennant for best elapsed time, and also the Mott Cup, having won it three times. Dandy was ruled out for using oars. The club are still divided over the question of the time, and, though the race has been sanctioned by the committee, the matter is not yet finally disposed of.

NO WIDE YACHTS WANTED.—The glowing pictures which some enthusiasts on this side of the pond have painted of John Bull throwing aside his timehonored rules and building Puritans does not appear to be quite in accordance with facts. The performance of the wide boat has waked up many of the chronic objecters to the rule, but without much encouragement as yet. We lately quoted an article from the London *Field* disposing of some fables of British origin about Puritan's ability, but stating at the same time that such boats would not suit their wants. In a later article on the subject of the Y. R. A. rules the same paper speaks as follows: "We last week expressed an opinion that there appear to be at present any urgent necessity for altering the Y. R. A. tonnage rule, although we should like to see it somewhat easier on beam when the proportion is four to one, and a little harder when the proportion is over five and one-half to one. What should be done with such vessels as Puritan, three and one-half to one, is a matter of small consequence, as no one desires to build such yachts on this side of the Atlantic." Undoubtedly the result of the races will hasten the death of the present rule; but there is not the least indication that British yachtsmen will go back to the wide form of yacht or will add very materially to the beam even of the extreme racers.

A NEW METHOD OF PROPULSION.—The long narrow boat that has been on the ways at Poillons' for some time is now nearly ready for launching and will soon make a trial of her peculiar machinery. The motive power is gas, generated by a small machine on board, and ignited in a cylinder to which compressed air is also admitted. This cylinder is placed on the keelson, well aft, and communicates with four oblong openings near the keel, two facing aft and two forward, the connections being such that any opening may be put in communication with the cylinder at will. To move ahead the two forward ones are closed and the after ones are opened, air and gas are admitted to the cylinder and ignited, an explosion follows, and the liberated gases act with great force by way of the openings on the water, driving the boat ahead. This impact is in practice almost continuous, and the power exerted is very great. To reverse, the two after openings are closed and the forward ones opened, thus driving the vessel astern. To turn, one on each side is opened, swinging the vessel around. There are no rapidly moving parts, the mechanism is simple, and it is claimed that a very large percentage of the fuel consumed is realized in the final effect.

A PROPHESY COME TRUE.—In a review of the America Cup races, the Berlin *Wassersport* has the following: "It cannot be denied that the highest hopes and expectations, even the firm conviction had seized the English, that their chosen craft would achieve a victory. Against this, however, stands out in astonishing contrast, that out of the enemy's camp itself, one voice was raised which foretold the Genesta's probable defeat and maintained that the English had allowed their chance to slip by. This voice emanated from a person who had fought for the advantages and good points of the cutter with a zeal almost frantic, and who claimed that in their day, Florinda or Majorie would have had a sure thing. The result of the recent races has been of a kind that we are obliged to concede sound judgment to this critic, Mr. C. P. Kunhardt, formerly of FOREST AND STREAM. For, the very condition which he insisted the English yacht should possess, that the representative selected should be speedy in the lightest of winds to insure success against the sloop, was the very condition the Genesta did not fulfil. But this warning voice went unheeded in the fire of enthusiasm which had seized the English."

A PICTURE OF THE GREAT RACE —Messrs. L. Prang & Co., of Boston, have just issued a large and handsome chromo of the finish of the final race between Puritan and Genesta. It is a reproduction of an oil painting by Mr. Wm. F. Halsalls, the marine artist, who has produced a very spirited picture of the two yachts. The sails of both are very well rendered, the drawing being correct and the coloring really giving an idea of life and motion; but the hull of the Puritan is incorrectly drawn, the sheer of the hull and the rise of the bowsprit are both exaggerated to a degree that gives a wrong notion of the boat. Another noticeable error is the coloring of Genesta's burgee, which is given as blue and red, instead of the black and red which have become so well known. The state of the water at the time is very accurately depicted, and in all respects, but the very important one noted, the picture is an admirable one.

THE BROKERS' YACHTS.—When Mr. W. R. Travers was at Newport last summer, a great many fine yachts lay in the harbor. "Wh-who-who-whose yacht is th-th-tha that?" he asked, pointing to one of them. "That belongs to Mr. Jones, the well-known broker." Mr. Travers raised his dexter finger slowly and brought into line another yacht. "Wh-wh-wh-whose yacht is that?" he asked with some difficulty. "Oh, that's Mr. Smith's the broker," "Wh-wh-whose is that?" pointing out still another. "That belongs to Mr. White, another broker." "W-w-well, wh-wh-where's the customers' yachts?" inquired the great Wall street joker.—*Chicago Mail.*

A RACING CUTTER FOR SALE.—The most promising class now existing in our yacht fleet is that of 50 feet or thereabouts on waterline, including Isis, Athlon, Oriva, Daphne, Vixen, Gaviota, and lastly Clara. The latter promises to set a pace next year that some of the big ones may find it hard to follow. Her class competitor and ablest rival on the other side, the 20 tonner Lenore, is now offered for sale and can be had at a reasonable figure. Here is a chance for some racing man who wishes to be near the top of the class next season. Further particulars can be had at this office.

RIVERSIDE Y. C.—A race will be sailed on Nov. 15 between Cheemaun, formerly well-known about New York, and the Arthur B., also a New York boat, both now being under the Riverside Y. C. flag, of Jacksonville, Fla. The Cheemaun is a jib and mainsail boat 25ft. 10in. long, owned by W. Fred Porter, and the Arthur B. is 20ft., owned by Vice-Commodore W. L. Davids. She sailed as a cat in the last race, but will be sloop rigged this time. On Oct. 17 a very high tide wrecked the club house and did some damage to the yachts hauled to clean for the fall and winter season.

AMERICAN Y. C.—A special meeting of the American Y. C. was held on Tuesday last at the club house, Commodore De Cordova in the chair. The report of the Regatta Committee was read and accepted, the dispute between Atalanta and Stiletto being decided in favor of the former. The prizes won in the regatta were on exhibition, and the proposed designs for an international challenge cup for steam yachts were discussed. The owners of Stiletto proposed a race for a $500 cup with Atalanta, from Fort Adams to Sands Point, the cup to be paid for by the owners of each boat and to remain a challenge cup. The proposal was not accepted.

MIZZEN STAYSAILS ON YAWLS.—A correspondent in San Francisco writes that the mizzen staysail has been tried on yawls there, but with poor results. One on the Enid elicited the comment from an observer, "That staysail is drawing like a team of horses, but I'm not prepared to say which way." One was tried on the little Sweetheart, but her owner describes its principal duties as "keeping the wind out of the mainsail, making back wind for the mizzen, and making it impossible to see anything to leeward. With these trifling exceptions it was a marked success."

PHOTOGRAPHS OF THE RACERS.—Chas. Miller & Son, No. 60 Nassau street, New York, have now ready a number of good photos of Puritan and Genesta, ranging in size from 5x8in. to 14x17in., and in price from 40 cents to $2.50.

THE SALE OF THE POLYNIA.—The steam yacht Polynia was sold on Tuesday for $10,100, the purchaser being Mr. W. H. Starbuck. She will probably be lengthened this winter.

Answers to Correspondents.

☞ No Notice Taken of Anonymous Correspondents.

TIM JONES.—We do not know the bore.

J. R., Toledo, O.—It is impossible to decide from the picture.

J. L. M., New York.—Write to P. H. Bryson, Memphis, Tenn.

C. B. D., Fall River, Mass.—It is not too late to register the dogs now.

R. H. C., Providence.—We expect to publish the lines of the Puritan shortly.

S. E., New Orleans.—See answer to another correspondent in this column.

G. F.—It is not against the law to hound deer in West Virginia and Maryland.

W. S. D., Baltimore, Md.—Write to Wm. Graham, Newtownbreda, Belfast, Ireland.

B. W. S., Jackson, Mich.—The Gordon setter attains full growth and feather when about two years old.

BEAGLE, Dover, N. H.—The Essex County Hunt is in New Jersey. C. A. Heckscher, Master, Orange, N. J.

INQUIRER, Providence, R. I.—Dutch, Jr., is owned by Mr. R. H. Dudgeon, 24 Columbia street, New York.

H. A. S.—The season ends Dec. 1. There is good duck shooting in the vicinity. Ask at the gun stores when you get there.

R. H.—The address of *Hunt's Magazine* is 119 Church street, Edgeware Road, N. W., London, England. We know of no other paper.

T. R., Brooklyn, N. Y.—Baronet and Belle both ran in the All-Aged stake of the Eastern field trials of 1881 on Robins Island, each winning one heat.

N. W., New York.—We know of no one who could train your poodle. Read "Training vs. Breaking," and train him yourself by the directions there given.

L. B. R., Maryland.—Try Monroe's "Florida Annual." The quail shooting is good in winter. The different railroads have different rates for dogs. You can learn them only by application to each road.

AN OLD READER, Des Moines, Ia.—The double nose must come through the dam. Many of the double-nosed pointers are good in the field, but no better than those without it. Most judges dislike to award a prize to such.

W. H. C., Sardis, Miss.—We are unable to determine the species of your snake from the fragment sent. It may be *Farancia obscura*, or possibly a piece of *Opheo. saurus ventralis*. But why in the world did you not send on the whole animal?

J. O. F., Hornellsville, N. Y.—A short time ago I had a snake here 15in. long, dark slate color or a blueish black, with an orange band or collar and orange belly. What was it, and was it venomous? Ans.—Probably the ring-necked snake (*Diadoptus punctatus*). It is not venomous.

H. G. M.—1. Get Munroe's map of Florida when it is published. 2. Florida books are Henshall's "Camping and Cruising in Florida," price $1.50; "The Florida Annual," price 50 cents. 3. The "broken-bone" fever is not likely to trouble you in cold weather. It is disagreeable but not dangerous.

L. E. W., Wilkesbarre, Pa.—1. Why are light color dogs preferred by most sportsmen—setters and pointers? 2 Is jet black with white breast objectionable in a pup whose sire is a red irish and dam blue belton? Ans.—1. Dogs of a light color can be more readily seen when working in cover, and for this reason many sportsmen prefer them. 2. The color is legitimate.

TRAP.—Will you kindly explain in your next what is meant by class shooting so as to settle and put an end to a long controversy? Ans. Yes, for the nineteenth time. Class shooting is a form of shooting in which the contestants are divided into classes according to the scores made and the prizes are divided among these classes. If six men tie on 9, five men on 8, four men on 7, etc., the six form one class, the five another and the four another. Then if 9 was the highest score made the first prize would be divided among the six men who tied on 9, or else they would shoot off for it, and it would be given to the winner of the ties. The second prize would go in the same way to those who tied on 8, the third to the ties on 7, etc.

PERCYVAL.—Will you give proper dressing for bass flies: 1. Rube Wood, 2. Gov. Alvord. 3. Whitney. 4. Cheney. 5. Also tell name of fly I found last summer, very good bass fly: Body mouse color or slate, wound with gray hackle, tail gray mallard, wings gray mallard and I think woodduck, a gray feather with two black and one white bar at the end. Is it a Wappinger? Ans. 1. R. Wood—White chenille body, brown mallard tail and brown hackle, gray mallard wing. 2. Gov. Alvord—Peacock harl body, red hackle, red tail, wings brown and drab. 3. We do not know this fly. 4. Cheney—Body of red and yellow-jointed, yellow part ribbed with silver tinsel, yellow hackle, green and woodduck tail, wing of woodduck's breast, with white stripe bordered with black. 5. It is very like the Wappinger.

W., Cleveland, O.—To brown gun barrels prepare a bath as follows: 1oz. muriate tincture of steel, 1oz. spirits of wine, ¼oz. muriate of mercury, ¼oz. strong nitric acid, ½oz bluestone, 1 quart of water. These are to be well mixed, and allowed to stand a month to amalgamate. After the oil or grease has been removed from the barrels by lime, the mixture is laid on lightly with a sponge every two hours. It should be scratched off with a steel-wire brush night and morning until the barrels are dark enough; and then the acid is destroyed by pouring on the barrels boiling water, and continuing to rub them till nearly cool. To stain twist barrels black and white, it is usual, after rubbing and coating with the browning mixture as above, to put them into an iron or block tin trough, with a small quantity of logwood and sulphate of copper and sufficient water to cover the barrels. The barrels are then boiled in the water for twenty minutes or half an hour. The barrels are then taken out and allowed to cool. When cold, they are scratched off with a steel scratch-brush, and scalded by pouring a kettleful of hot water over them. They must then be rubbed down until nearly cool. The same method of troughing is required to brown them a dark brown; but when they are taken from the trough they are coated with the browning mixture as at first, and scratched off, and recoated three or four times. They are then finished off by pouring boiling water upon them and rubbing with soft cloth until nearly cool. The process of browning takes from four to eight days, according to the temperature of the browning-room. If the barrels are wanted quickly, they may be scratched off as often as three times in twelve hours.

THE WRONGS OF THE METIS.

THE hanging of Riel will not exculpate Sir John Macdonald, although it may satisfy some of his followers. The blood of Riel will not wash out the stains caused by the blood of priests and settlers and volunteers shed because Sir John McDonald chose to misgovern the Northwest. No attempt was made in the House of Commons to reply to the charges made by Mr. Blake or to weaken the value of the evidence he adduced. The attempt now made but serves to show how well-founded and how crushing those charges were. So early as 1878 the half-breeds felt that it was necessary that the claims which they had made some time before should be settled; that they should be secured in the possession of their properties, and that their titles should be made good.

What objections there could be to half-breeds, whose ancestors had lived so many generations in the Northwest, settled on any lands they preferred, when people were invited to come from all parts of the world and take lands without price, no one can tell even now.

The Northwest Council strongly urged the Dominion government to give the lands to the half-breeds, and thus attach them to the cause of stable, regular government.

Mr. Dennis, their deputy head in the Department of the Interior, advised that they should get what they claimed, and argued that "by this means we should have the whole of this element in sympathy with the government."

Arbishop Taché, to whom it appears this suggestion was submitted, strongly advised the government to settle the half-breeds firmly on the lands, and suggested the power to alienate the lands assigned to them should be withheld for a time.

Bishop McLean, of the Church of England, gave similar advice.

But nothing was done.

The Metis petitioned again and again, as Father Andre stated at the trial. Priests and others wrote to the government, urging, imploring that the people, who became more uneasy every day, should be set at rest by having their reasonable claims satisfied.

The only answer they could get was that their petitions would receive consideration some time.

Bishop Grandin, who we are now told had other business also in Ottawa, pressed the claims of the people on the attention of the government and did all in his power to induce a speedy settlement.

He failed.

The Metis subscribed the cost of the mission, a heavy amount for them to raise.

The delegates were assisted, we are told, by Bishop Grandin.

They failed.

They took back only promises that the matter would be attended to—promises which proved futile.

The Metis, uneasy and troubled, fearing, all the more because of the delay which seemed so unaccountable, that they would lose their properties, awaited anxiously the fulfilment of the promises. They were not fulfilled.

Years rolled on. Surveyors were sent into the district to prepare the way for settlement of whites, and these surveyors, in utter disregard of the rights and wishes of the Metis, ran their lines so as to cut up the farms, and in some cases put a man's dwelling on one lot and his barn on another. It is contended now that Sir John Macdonald should not be held responsible for what his surveyors said or did. He should have remembered how much his surveyors did to cause the Red River rebellion. He might have rendered harmless what is now said to have been the mere vaporings of those surveyors if he had kept his promise and given the Metis proper legal titles to their lands.

What the surveyors said and did seemed to the Metis to be the explanation of Sir John Macdonald's conduct in treating their petitions and remonstrances as he did. He did not give them legal titles, they thought, because he wished to give their lands to others.

And he did give their lands to others, so confirming their worst fears, so convincing them that all his promises made in reply to their petitions and applications were false.

They were threatened with eviction in many quarters. The legal title to the lands held by the settlers of St. Louis de Langevin was unquestionably given to the Prince Albert Colonization Company.

Among the few hundred who actually rebelled were those settlers.

What fair-minded man will say that Sir John Macdonald is not responsible for the mad acts of these people, ignorant as children of the ways of the world, whom he drove to despair?

As their last resort they sent delegates to Riel in Montana, asking him to come to their help. He had succeeded in obtaining for the Metis on the Red River the recognition of their rights to the lands they held and they imagined that he could do as much for them.

Riel came. Meetings were held at which the wrongs of the Metis were stated. Appeals for redress were renewed. All professed a desire to employ peaceable means. These appeals were treated as all previous appeals had been. Then came rumors of disaffection, and rebellion began to be talked of as possible, if not among the Metis, at all events among the whites. All this would have satisfied prudent men, respo nsible for the peace and good government of the country, that it had become absolutely necessary to do something to prevent serious trouble.

Sir John McDonald did nothing to prevent trouble. He rather sought and courted it. The grant of the lands of St. Louis de Langevin to his friends, Mr. John White and Mr. Jameson and their associates, the Metis natually regarded as his answer to all their applications, and his defiance. But while defying the Metis and provoking them by wrongs so great, he did nothing to show them that he was as powerful as he was unjust. He allowed Reil to remain among these wronged and excited people and to do as he pleased without the slightest check. His idea of the extent of the danger and trouble his injustice, his insolence and his disregard of the wishes, the feelings and the rights of the people had caused, was shown by his ordering the small force under Crozier to that Hudson Bay Company's post. To send so small a force was but to provoke the injured to rebellion. Major Crozier unfortunately shared Sir John McDonald's contempt for the half-breeds. It is now asserted that the order in Council appointing a commission for the settlement of the half-breed claims was passed in January, 1885, and that the Lieutenant Governor was informed thereof. Why was that order held back until the Metis had actually taken up arms? Why were not proper means taken to let the Metis know even then that the commission was appointed or was to be appointed.—*Toronto Globe, Oct. 24.*

ITHACA, N. Y., Oct. 27, 1885.—Interest was aroused in science circles at Cornell University to-day by the intelligence that a very rare specimen of the manatee or sea cow, shipped from South America recently, had arrived here this morning and would be exposed to view as well as lectured upon by Dr. Wilder at 11 o'clock. At that hour the lecture room was crowded with professors, students and visitors. Dr. Wilder said that the manatee is one of the cases in which evolution has produced just the opposite of its usual effect. The manatee is an animal belonging to a family that had evidently seen better days. He continued: "I predict that not many years hence there will be found more and more conclusive evidences that the forms from which the manatee and its relatives have been descended had arms and legs and a very much smaller tail. The hind legs have been lost in the process of evolution, the front legs have been degraded into fins, and the tail has become one for swimming instead of one flapping from side to side." The manatee will be carefully dissected, with a view to demonstrating the bearing of its whole structure upon the question of retrograde metamorphosis.

It is to be devoutly wished that we shall not read this year of such revolting cruelties as took place last year in connection with what are called deer hunts. It is atrocious that in a country like England, where cock fighting, bull fighting and the prize ring are by act of Parliament declared illegal, a noble animal like the stag can be doggedly run down by savage dogs and scarcely less savage mobs until his heart is broken and he falls down dead. Why is not one crime as heavily punished as the other? A costermonger who kicks his donkey is heavily punished, but a lord can cause a deer to be literally run to death and no one can interfere.—*Paris Register.*

BRAIDED FISHING LINES.

The great superiority of a properly braided line over a twisted or laid line, has increased the demand for braided lines enormously. This demand has induced a number of manufacturers, entirely unacquainted with the requirements of anglers, to put on the market a quantity of perfectly worthless goods. Many of these lines are undersized and short of marked length; nearly all of them are made of poor material and on old-fashioned machines. Anglers will please take notice that *all of our best braided lines—cotton, linen, raw silk, dressed silk, oiled silk, enamel, and polished waterproof tapers—are labeled with our full firm name and trade mark*, except the enamel fly lines on cards, which bear only our trade mark and the name of the Empire City Braid Co., whose agents we are.

If your dealer does not keep our goods in stock, or will not order them for you, send us 50 cents for our 180-page folio illustrated catalogue.

AIR GUNS

PRICES: $6, $9, $10, $12, $15, $18 and $20.

FOR PROFIT AND PLEASURE.

The gun shown above is our **NEW COMBINATION AIR GUN.** This is the most complete arrangement ever offered. It combines two pieces in one (a perfect Rifle to shoot a regular 22-100 cartridge, and a superior Air Gun to shoot darts, slugs and shot). It can be instantly changed from one to the other, and has a steel barrel rifled. All the parts extra heavy, and so constructed of best material to stand continuous service, making the most durable gun manufactured, and by far the most practical long-range Air Gun ever made for gallery or field. WE MANUFACTURE A FULL ASSORTMENT OF AIR GUNS SUITED TO MEET THE TASTES AND WANTS OF EVERY ONE. The quality of our goods has established them in all the principal markets of the world, and their superiority has induced the United States Navy to place them, with success, on their school ships. ☞Illustrated price lists sent upon application. Note.—We stamp our name plainly on each gun we make. Send for catalogue B.

CANOE HANDLING.

By C. B. VAUX ("DOT").

A complete manual for the management of a canoe. The author begins at the very beginning, describes and explains the rudiments in the simplest and plainest way possible. Everything is made intelligible for beginners: and besides this A B C teaching there are so many hints and wrinkles that the oldest canoeist afloat will find pleasure and profit in the study of these. The book is complete and concise—no useless duffle between its covers. The subjects treated are the choice of a canoe, paddling, sailing, care of the canoe, recipes and rules. The text is further elucidated by numerous practical drawings, and the beauty of the book is enhanced by the many ornamental vignettes. Pages 168; uniform with "Canoe Building." Price, postpaid, $1.00.

SMALL YACHTS.

Their Design and Construction, Exemplified by the Ruling Types of Modern Practice.

By C. P. KUNHARDT.

The Forest and Stream Publishing Company takes pleasure in announcing the publication of a magnificent quarto volume, bearing the above title. This book covers the field of Small Yachts, with special regard to their design, construction, equipment and keep. The opening chapters are devoted to a consideration of the model and the draft, their relations to one another, and the purposes which they subserve. Full directions are given for producing the plans of a yacht with reference to the chief points in design, and the method of taking off the lines of a boat already built is likewise described in detail.

All elements entering into design, such as Resistance, Stability, Balance of Rig, Handiness, Displacement, etc., are dealt with in separate chapters. The rules necessary for the mathematical computations, and a review of theory and practice close the first division of the book.

The second portion comprises the description of the Plates, covering the whole range of type in small yachts, from the shoal catboat and American centerboard sloop to examples of the narrowest and deepest British cutter yet built. These yachts have their lines, build and fittings depicted in the Plates, which are drawn to scale. With their aid and the specifications presented, the reader is placed in possession of accurate information concerning the mould, accommodations, rig and characteristics of all styles of yachts which have received favorable recognition. Sporting boats, combination row and sailboats, and various examples of special form are introduced.

The third division offers a comprehensive review of single-hand sailing, to which small yachts are especially adapted. Directions are given as a guide in selection of type and sail plan, and subsequent equipment and proper management.

The iron work of yachts, their gear, yawls, stearing apparatus, boat building and much other closely related matter is entered upon. The new International Rules of the Road, Signal Service, and a bibliography appear in the Appendix.

The work is profusely and handsomely illustrated with 150 illustrations inserted in the text, besides the sixty-three plates as follows:

LIST OF PLATES.

I. The Sloop Yacht Schemer.

"FOREST AND STREAM SERIES."

DEER HUNTING.

BY JUDGE JOHN DEAN CATON.

BY and by it will be time to hunt antelope and deer. It is always time to read about them. Judge Caton's book on the antelope, elk, deer, moose and caribou of America discusses in a readable way the life history of these animals and the methods of their capture. It is the work of an enthusiastic sportsman who has had a wide experience and has devoted the leisure of years to studying these interesting game animals. The volume is very fully illustrated, and is a perfect storehouse of information and entertainment. The first edition was sold by the Boston publishers at $4. Price $2.50.

WOODCRAFT.

BY "NESSMUK."

A COMPACT pocket handbook of condensed, boiled-down, concise, clear, comprehensive, sensible, practical camp gumption. "Nessmuk" has been "in the woods" in Michigan, New York, Pennsylvania, and South America, and this is a book for outers, wherever they kindle their camp-fire. The author believes in "smoothing it." He has learned how; now he tells others. It is much easier to learn from "Nessmuk" than from Dame Experience. We should not be surprised if "Woodcraft" completely revolutionized the methods of camping out. If you are going to the woods, read "Woodcraft" before you go. It may add to your trip a hundred fold. Price $1.00.

DOG TRAINING.

BY S. T. HAMMOND.

HE was a promising puppy, and when you turned him over to the breaker to be educated, you thought he was bound to make "the best dog in the world." And you'll not soon forget how disappointed and disgusted you were when the dog, the breaker and the big bill—all three turned up together, and you saw that the animal's spirit was broken and it would take a steam calliope to make him mind. Now, this could not have happened if you had been wise enough to buy a copy of Hammond's book, and in your odd leisure moments *train* the dog yourself instead of having him *broken* by some one else. We are selling edition after edition of this book, and it is revolutionizing the system of preparing dogs for work in the field. Price $1.00.

SHORE BIRDS.

A PAMPHLET for those who "gun" along the shore. Tells of: I. Haunts and Habits—Where the bay birds live and what they do at home. II. Range and Migration—Where they go to breed and where to spend the winter. III. A Morning Without the Birds—An episode of shore shooting. IV. Nomenclature—A list of our American species of *Limicolæ*, with a description of each species. V. Localities—Where to go to shoot them. VI. Blinds and Decoys—How to shoot them after you have reached the grounds. 45 pp., paper. Price 15 cents.

ANGLING TALKS.

BY GEORGE DAWSON.

AS a political writer of conceded power, Mr. Dawson wielded a trenchant pen; when he turned from the conflict of parties to the praise of the favorite pastime of "simple wise men," his essays, limpid as the crystal streams, are aglow with the soft summer sunlight and melodious with the songs of birds. When angling was the theme, he wrote from a full heart and in closest sympathy with the scenes and pursuits described. These "Talks" are brimful of manly, wholesome sentiment; there is in them all not a particle of cant. Their sincerity and overflowing spirit at once win the reader, and he perforce shares the author's enthusiasm. The effect is magical, like that of the mimic players in Xenophon's *Memorabilia:* he who reads, if he be an angler, must go a-fishing; and if he be not, straightway then must he become one.—*Extract from Publishers' Preface.* Cloth, price 50 cents.

CANOE "AURORA."

BY DR. C. A. NEIDÉ.

A CHARMINGLY written and always entertaining account of a canoe cruise from Lake George, New York, down the Ohio and Mississippi Rivers to the Gulf of Mexico, by the Secretary of the American Canoe Association. To read the cruise of the "Aurora" is the next best thing to having made it; and the reading is decidedly more pleasant than would have been participation in some of the misadventures related. 216 pp., cloth. Price $1.00.

FOREST AND STREAM

A FAMILIAR TALK.

With the approach of a new year it is not necessary to announce any change in our manner of conducting this journal. Just what the FOREST AND STREAM has been in 1885 we hope to make it in 1886. It will be run on the same old principles, tested by experience and approved by prosperity. It will be just as entertaining, just as instructive, just as frank and outspoken, and just as helpful.

We are sometimes asked to explain the reason of the FOREST AND STREAM'S constantly widening influence and prosperity. Well, there is no

Trade-Secret

about it, and we do not mind telling you. It is this: We have not expended our energies in preposterous spread-eagle proclamations of tremendous attractions in the dim and distant future, but have pinned our faith to present performance, each week, and fifty-two weeks in the year. This in the kind of journalism that is bound to succeed. Nothing very occult about it, you see.

Another element of strength is the jealousy with which we have maintained the inherent dignity and entire respectability of the pastimes discussed in these pages, and the extreme care we have taken to keep the tone of the columns such as renders the paper fit for any man to receive into his family. We are assured by men, whose good opinion we value, that they do not think it necessary to make

A Weekly Scrutiny

of the contents of the FOREST AND STREAM before venturing to lay it on the family table, We determined, years ago, that a clean paper must win its way among sportsmen (not "sporting men"). The fact that it has done so is now cited, not that we may boast of our own prescience, but as a most gratifying evidence of the high standing of the field-sports to which this journal is devoted.

In other words, the reason why the "Forest and Stream" is liked by sportsmen is that the "Forest and Stream" is the kind of paper that sportsmen like.

This, as we have said before, is complimentary all around. A third element of the paper's popularity is this: It has some hundreds of correspondents and contributors, who write for it because they have something to say. You have heard the story of the German professor who was assigned to prepare a thesis on the elephant. Now, he had never seen an elephant, so he evolved one out of his inner consciousness. Though we never read his essay, we have not the slightest doubt it was a very dry one. But if the German professor had ever come across

A Real Live Elephant

in an African jungle, he could have written a thesis on the beast that would have had some animation in it. That is just the secret of the interest of the FOREST AND STREAM'S contributions. They come from men who have seen or done or heard something to write about. Nothing dry in their notes and sketches and letters. They put it on paper just as entertainingly as they would talk when gathered in camp after the hunt, or sitting about the fire and comparing notes of the day's shoot. These stories and sketches come to us from sportsmen who represent every phase of life—all the professions and trades and occupations, from which busy men now and then turn aside for a bit of fun by the stream or in the stubble.

Of course the great bulk of matter appearing in this paper has related to the game and fish of our own country, for that, after all, is what FOREST AND STREAM readers are most interested in. And what a variety there has been! Squirrel shooting in the woods back of the barn, antelope on the distant plains, quail in the wheat stubble, and "chickens" on the prairie; ruffed grouse on the wing and "partridge" on a limb; elk on the "hogbacks," moose in the timber, deer in the brush, caribou on the barrens and coon in the hollow. All sorts of game by all sorts of methods, and in all sorts of places, and by all sorts of people.

Give Cuvier a Bone.

and the great naturalist could construct from it (or he pretended he could) the whole of the animal, living or fossil, to which it must have belonged. Give a man (say 500 years hence) the file of the FOREST AND STREAM for 1885, and he will not need to be a naturalist to reconstruct from its pages the animals and birds and fishes of this country (and he'll find in it a vast deal of curious and instructive information about the "true sportsman," too).

So, you see, the FOREST AND STREAM is a journal of recreation. We do not mean alone that it treats of recreation, but in its columns *is* recreation. This is the practical nineteenth century realization of the old story of

The Magician's Carpet,

on which one sat cross-legged and wished himself in a lovely garden a thousand miles away. With the FOREST AND STREAM in hand you do not need to be a magician to transport yourself in a second to the hemlock browse and the trout pools, the quail cover or the "chicken grounds." Perhaps, after all, we should have named this first, when we began to tell you the secret of FOREST AND STREAM'S success as a sportsman's paper.

The weekly issues of the FOREST AND STREAM form two volumes each year of twenty-six numbers, or 500 pages each, and the file constitutes a library of permanent worth. Twenty-four volumes have already been published. We furnish handsome file binders (price $1.50) which hold twenty-six numbers.

Subscriptions may begin at any time. Per year, $4; $2 for six months. Remit by post-office money order, draft or registered letter. Give name, town, county and State. Address

FOREST AND STREAM PUB. CO., 39 Park Row, N. Y.

Canoe and Camp Cookery.

By "SENECA."

A practical cook book for canoeists, Corinthian sailors and outers. Practical because the author gives explicit and intelligible directions for preparing such dishes as he has himself actually tested in camp and on a cruise. This is just where the recipes differ from the absurdly impracticable dishes given in some so-called camp cookery books. The cooking outfit is described, and numerous hints on camp economy add to the value of the work. Cloth, 96 pages. Price $1.00.

FOREST AND STREAM.

A WEEKLY JOURNAL OF THE ROD AND GUN.

TERMS, $4 A YEAR. 10 CTS. A COPY. SIX MONTHS, $2.

NEW YORK, NOVEMBER 5, 1885.

VOL. XXV.—No. 15. NOS. 39 & 40 PARK ROW, NEW YORK.

CORRESPONDENCE.

THE FOREST AND STREAM is the recognized medium of entertainment, instruction and information between American sportsmen. Communications upon the subjects to which its pages are devoted are respectfully invited. Anonymous communications will not be regarded. No name will be published except with writer's consent. The Editors are not responsible for the views of correspondents.

ADVERTISEMENTS.

Only advertisements of an approved character inserted. Inside pages, nonpareil type, 25 cents per line. Special rates for three, six and twelve months. Reading notices $1.00 per line. Eight words to the line, twelve lines to one inch. Advertisements should be sent in by the Saturday previous to issue in which they are to be inserted.

Transient advertisements must invariably be accompanied by the money or they will not be inserted.

SUBSCRIPTIONS

May begin at any time. Subscription price, $4 per year; $2 for six months; to a club of three annual subscribers, three copies for $10; five copies for $16. Remit by registered letter, money-order, or draft, payable to the Forest and Stream Publishing Company. The paper may be obtained of newsdealers throughout the United States, Canadas and Great Britain. Newsdealers in the United Kingdom may order through Davies & Co., No. 1 Finch Lane, Cornhill, London. General subscription agents for Great Britain, Messrs. Sampson Low, Marston, Searles and Rivington, 188 Fleet street, Loudon, Eng. Foreign subscription price, $5 per year; $2.50 for six months.

Address all communications,

ANSWERS TO CORRESPONDENTS.

AFFAIRS IN THE YELLOWSTONE PARK.

COLONEL D. W. WEAR, the Superintendent of the National Park, has made his first annual report to the Secretary of the Interior. He assumed the charge of affairs July 1, and, as might have been expected from what we know of his predecessor, found things in a wretched state. There was no discipline among the assistants, game was being destroyed in considerable quantities and without interference on the part of the employes. He states that now the Park is full of game, and mentions elk and bison as abounding. Under the direction of Lieut. Kingman, the engineer in charge, sixteen miles of splendid road have been constructed between the Mammoth Hot Springs and the Geyser Basins. Bridges have been built and roads repaired Attention is called to the extremely unsatisfactory hotel accommodations in the Park and to the high prices charged for them, and it is suggested that some officer be appointed to see "that there is something like the equivalent given their patrons." The Superintendent requests that the force be enlarged from ten to fifteen, and that they be paid $1,000 per year and $100 per year for their horses and equipments. Reference is made to the inadequacy of the present laws, and it is suggested that instead of depending on the Territorial laws of Wyoming, Congress establish a court within the Park with power to remand for trial to the nearest court having criminal jurisdiction. He states that travel in the Park this year has been greater than ever before, recommends the surveying of the lines of the Park, and asks for an appropriation of $150,000.

On the whole, the document appears to be a fair and intelligent setting forth of the condition of things in the Park. It contains, however, at least one erroneous statement. This has to do with the abundance of game there. There are a few antelope in the Park, and if carefully protected these will, in the course of a few years, become numerous. Elk and deer are quite abundant. It is a great mistake, however, to assert that bison, or buffalo, exist there in great numbers. We made careful inquiry of a number of well-informed persons whom we saw during a visit to the Park last summer, as to the probable number of buffalo to be found within its limits, and were assured that the number was small—under 200.

There are said to be four small bands of buffalo in the Park. One of these lives on the head of Slough Creek, and between that and Hell Roaring; another on the level prairie near the falls; the third near the head of Yellowstone Lake, and the fourth in Heart Lake Basin. There are also a very few over near Henry's Lake—outside of the Park. It is estimated that the four bands within the Park contain from forty to sixty each—perhaps in all two hundred individuals. Another estimate placed the number at something less than two hundred. Mr. Wakeman thinks that one hundred would be a liberal estimate of the number in the Park. In May last he saw eighty one in Hayden Valley, of which about fifteen were calves.

It is evident that the number is small, and that no precautions must be neglected to protect them from slaughter. They are the few remaining survivors of the grand race which once covered almost the whole country, and we cannot afford to have them swept out of existence. We heard of the killing of one individual this summer, by a young man who ought to have known better; but as he was fined $50 for the act he will probably care less for buffalo meat in the future.

Sharp measures have been employed against the game butchers this season, and before long we shall have more to say on this point. At present it is enough to mention that one notorious meat hunter was convicted of killing two elk and eight beaver within the Park, was found guilty, fined $100 and costs, and sentenced to be imprisoned in the common jail for six months.

The work done in the Park by Lieut. Kingman is excellent, and the roads reflect credit on him and his force. The hotel accommodations in the Park are extremely bad, the food and service being execrable, and there is great need of improvement in this respect. A new and wealthy company are said, however, to have obtained leases for hotels, and as the persons interested are men of large wealth and business capacity, they will undoubtedly see the importance of treating the public decently. The ridiculous and now moribund National Park Improvement Company have never pretended to do this.

It is of the utmost importance that the force at the command of the Superintendent should be increased. We have urged this again and again, and the need for more men grows constantly more pressing. But it is the merest waste of money, besides bringing the force into disrepute with natives and visitors to send out political appointees from the East. They are utterly unfit to perform the duties required of them, of which they know nothing when they seek the place.

We saw several of these young men this summer. They spent their time loafing about the hotel, and in the evening got drunk at the bar, and made themselves extremely offensive to ladies and others who were staying there. It is really disgraceful that such men should occupy positions of authority.

We understand that since we left the Park two or three men have been appointed assistant superintendents who are old Western men, among them Jack Baronet, who is an old timer in the country. Such men can and will do the work required of them.

Colonel Wear's request for an appropriation of $150,000 ought by all means to be acceded to by Congress. It is little enough when we consider the size of the region and its importance. As to running the lines of the Park again, that may well enough be postponed until we see whether Congress will, at its next session, have the wisdom to enlarge the Park so as to take in Jackson's Lake and the Tetons on the south, and the country lying west of Cedar Mountain on the eastern side.

We hope that this may be done.

AN INTERNATIONAL CUP FOR CANOES.

AMERICAN canoeists have always realized that while they have now made the sport peculiarly their own and advanced it to an extent unheard of elsewhere, it is of English origin, and that they owe directly to such men as MacGregor, Baden-Powell and Tredwen the creation and introduction of the modern canoe. All that pertains to English canoeing has been a subject of interest to our canoeists, and they have always had the greatest desire to have the fathers of the sport at one of their meets, and to try conclusions with the best English canoes. As there was a probability of at least one canoeist from England visiting us next year, the New York Canoe Club, the oldest in the United States, has taken the matter in hand and has made arrangements to offer a challenge cup, to be raced for under the conditions given elsewhere. The defense of the cup will not be restricted to members of the New York Canoe Club, but canoeists will be invited to enter a series of trial races, one finally being selected to meet a representative chosen by the British canoeists.

For some years the canoes of the two nations have been growing more and more different, ours being relatively smaller, lighter, and with less sail and ballast. The evidence thus far in the trials between the two types tends to show that the smaller one, while more convenient and portable, is no less speedy than its heavier and more complicated rival; but the question can only be fairly settled by a series of races between the best men and boats of each country. It is expected that a party of English canoeists will be organized to visit the meet in 1886 and to take part in the races there, and that either before or after the meet the races will be held in New York for the challenge cup.

SEVEN DOLLARS AND AN EAR.

THEY are wrestling with a great problem down on Long Island. The disputation has waxed hot for a month, but its settlement is seemingly as far off as ever. It is all about an ear. When the Island turned out *en masse* to exterminate the deer, in the first week of October, there were mustered on the average fifty hunters to one deer. There was no occasion for dispute, when fifty men came home without the game, for there was plenty of disappointment and chagrin to go around, giving each one his share and some left over. But when the fifty men killed the single deer, the real fun began. There was just enough venison for a most tremendous wrangle over the infinitesimal fragment due each hunter and his dog. The only expeditious way out of the bickering was to sell the meat and divide up the coin. This was done in a number of instances where the claimants were all of the same party and each had an undisputed right to his share of the booty. But a more intricate complication arose when one deer was started by a party of hounders and driven to another party who had no dogs. One of this party shot it. When the hounders came up they laid claim to the meat. This was resented. Then hounders and still-hunters wrangled, and the hounds lifted up their voices in unison. Finally a compromise was effected. The man who had delivered the fatal shot was awarded the promise of seven dollars and an ear of the deer in consideration of his relinquishing in full all claims to the rest of the carcass.

Seven dollars and an ear ought to be reward glorious enough to satisfy the most ardent and avaricious sportsman; but this was only the promise of the reward, not the actual tangible ear itself. As the event proved the promise was illusory. The ear, we are informed, has not been delivered. The wronged man did exactly what any sensible person would do in similar circumstances; he wrote to the FOREST AND STREAM. Below are the two plaints:

Editor Forest and Stream: In yesterday's issue of the FOREST AND STREAM we found your answer upon "Who Takes the Deer," which leaves this question still a problem. As we are much interested in the solving of it we take the liberty to ask you whether there is no way to get a positive answer by interference of your so esteemed sporting paper. By answering this in the following number you will greatly oblige G. J. T.

SAYVILLE, Oct. 26.—*Editor Forest and Stream:* The last issue of the FOREST AND STREAM did not mention any more about the question "Who owns the deer?" The interested parties being very anxious to have a positive answer, without resorting to court or lawyers, would be most pleased if your paper—exclusively dedicated to all sporting matters—would aid them in solving this problem, by putting the question in your columns for an answer, or in any other way as seems the best to you. Respectfully yours, G. J. KLAASSEN.

The problem is too much for us. If the man got his ear, we confess we do not see what there is to quarrel over or to go to law about. If he did not get the ear he has a clear case, provided he can prove the contract.

AND YET ANOTHER.—A Michigan hunter the other day saw a moving object in a cranberry swamp and shot it. He took it for granted that it was a bear; but the victim was found to be a woman. The shot was fatal. There is no special moral to be drawn from this. Men and women have been taken for bears and deer and woodchucks, and they probably always will be just as long as idiots who shoot at everything that moves are allowed to go armed into the woods.

A HINT OF THE WIDE RANGE of this journal is given in to-day's issue by two communications on the same subject, one coming from England and the other from California.

THE YACHTING SEASON OF 1885.

THE safe arrival of Genesta at Portsmouth on Oct. 28, after a quick and successful passage, marks the ending of a most exciting year in American yachting, as well as the conclusion of the best effort that England has yet made for the capture of the America's Cup. At 9 A. M. on Oct. 28 Genesta sailed into Portsmouth with three winning flags flying, indicative of the three cups she won here, having made the passage in 19 days 19 hours, remarkably good time for a yacht of her size. The voyage was a stormy one, plenty of bad weather and head winds; but in spite of all she made some excellent runs. On the first day she covered only 99 miles, but later on her runs were 212, 238 and 240 miles. Her time has been surpassed, in 1869. Sappho ran from Sandy Hook lightship to Queenstown in 12d. 9h. 36m.; in 1866 Henrietta went to Cowes in 13d. 21h. 55m., with Vesta and Fleetwing a few hours later; in 1868 Sappho made the run in 14 days to Cowes, and again, 1872, in 18 days. Dauntless in 1869 went to Queenstown in 12d. 17h. 6m., and in 1873 Faustine made the same run in 18 days. America's time to Havre was 21 days, and in 1851 Silvie made the same port in 16d. 12h. In 1863 the schooner Gipsey went from New York to Queenstown in 19 days, and in 1866 the Alice went from Boston to Cowes in the same time. Compared with these, nearly all of them much larger vessels, Genesta's performance is very good as regards time, while of her behavior Captain Saunders, her navigator, speaks in the highest terms, praising especially her dryness. For a time on Oct. 14 she was hove to, following which were head winds and bad weather, but no accident occurred except that the mate injured his ankle in lowering the trysail. Before this Genesta is safely at Wivenhoe, and with her laying up ends a season that has been a most exciting one to American yachtsmen.

Not the least important fact of the year's yachting is the first passage across the Atlantic of a modern lead mine, and the entire disappearance of the ill-omened auguries and general doubt with which the performance has been awaited on this side. First came Genesta, with 70 tons on her keel and no beam in particular, making a safe and speedy passage, and settling the question of her seagoing qualities. Following her came Stranger, a smaller yacht, and then little Clara, only 20 tons and of 9 ft. beam, but carrying her racing spars boldly across the Atlantic. In beam, displacement, ballast, rig and speed she is in the top list of extreme cutters, her powers as a racer are generally acknowledged, and now she has fully proved what this type of boat can do as an ocean cruiser. The safe and speedy voyages of these three settle forever the doubts and assertions that have been current as to the buoyancy and seagoing powers of the narrow, heavily ballasted type of British cutter, and prove they are no less suited to off-shore cruising than to the modern regatta course.

In most departments of yachting the year has been a notable one; in steam the Herreshoffs have brought out their usual annual surprise, this year in the shape of a marvelously fast launch of the torpedo type, undoubtedly the fastest steam vessel yet built in America. This year has seen the first really successful races of steam yachts yet run in American waters, and an increased interest in this phase of yachting. No marked improvement in engines or appurtenances is to be recorded, but the sport is now under the protection of an active and enterprising club, and the general standard of excellence among steam yachts, once low enough, is gradually improving.

This year has also witnessed a revival in the grand old sport of schooner racing, and there has really been quite a rivalry among half a dozen yachts, most Eastern. Fortuna, Gitana, America and Mohican have made matters lively in Boston waters, the former being the first on the list of American schooners in 1885. About New York but little has been done. Montauk and Grayling have been the leading, almost the only boats, and the honors for the year go to the latter. Again the old America has sent up her racing flag, but those who still admire the old craft can only regret it, as she has added no new laurels.

The story of the sloop racing would be a short one were it not for the international contest for the America's Cup. Again a British yacht has challenged, we have built two yachts to meet her, one of which has not been successful, while the other has added another to the long list of American names that adorn the old trophy. The subject is too extensive a one for a hurried review and deserves time and space in the near future.

Leaving these races out of the count, the sloops have made but a poor showing. The early races found but three sloops in the larger classes, the trial races only one, and the final outside race only Gracie came to give battle to the visiting challenger, the rest kept bravely out of the way.

The chief interest among the cutters centers in the two new arrivals, Stranger and Clara, the former as yet having given no earnest of a successful career here, while Clara has started in bravely by outsailing her class and nearly saving time on Gracie in the only race open to her this season since her arrival.

In the smaller classes the sport has been fairly good, the most encouraging feature being the rapidly increasing interest that men are taking in yachting, and the higher standards and more liberal views prevailing among yachtsmen generally. Racing has been no more lively, in fact some of the classes have not filled as in former years, but there are more yachts, especially of smaller tonnage, built each year; more amateur sailors enlisted, and a general desire is manifested for improved boats and for a better knowledge of principles. On the whole the year has been a most instructive and encouraging one for American yachtsmen, one that has added its full share in the development and extension of the sport.

[From a Special Correspondent.]

THE GRANARY OF THE WORLD.

SO it has been called, this northern land of lakes and forests and broad prairies. And the appellation is not altogether fanciful. Visit Minneapolis and inspect its flouring mills, inquire as to their number and the capacity of each, and you will find that the annual product of flour from this source is enough to supply the world with bread—for a while at least. These mills can turn out thirty thousand barrels of flour per day, when running on full time, and at this rate their product for a year would supply one-quarter of the population of the United States with the bread which they annually consume. It may be taken for granted that these mills have not been established here without some good reason. The great water power of the Falls of St. Anthony is usually alleged as the cause of the growth of this tremendous industry, but that alone would not be enough to have brought it into existence and to have raised it to its present proportions. The true cause is that the whole vast country from the Mississippi to the Rocky Mountains, all through Minnesota, Dakota and Montana, is a wheat-producing country, all of the product of which is tributary to the city where these mills are located

We have all heard of the Red River wheat fields, and their enormous fertility and productiveness, but all do not know that far beyond the Red River, and reaching nearly to the Rocky Mountains, there is land which without irrigation now produces excellent wheat, and which in the near future is destined to become even more productive than it is at present. It is stated that the climate of the western country is constantly being modified by the changes wrought by human agency. And this statement is true. The annual precipitation is far greater now in regions recently occupied than it was when the settlers first came into the country. Thus people say, roughly, that "the railroad brings rain," and in a sense they are right. The railroad brings settlers, who cultivate the soil and plant trees. The crops which they grow and the trees which they plant serve as so many pumps, which, by means of their millions on millions of tiny roots suck up from the subsoil the water which lies hidden there, out of reach, and then, by means of their leaves set free this water in the atmosphere, where it is again condensed and falls upon the earth in the form of rain or dew. These influences, constantly at work, cannot fail to exercise a most important influence on the climate of any region. The water which exists within any given area—to say nothing of what is brought by aerial currents from the ocean or from great lakes—is used over and over again, and the result is twice as much rain, a climate which once was dry now moist and damp, great increase in the growth of all vegetation, and an ability to raise crops in localities where formerly the seed would scarcely germinate, or if it did sprout, the plant withered early in the summer.

All this corresponds with experience. There was a time—and it is within the memory of people who are yet young—when it was thought impossible to grow crops as far West as Wood River, in eastern Central Nebraska. To-day that is the greatest corn country in all that corn-producing State, and the farming belt is creeping steadily toward the mountains. Each year the homesteaders push a little further westward, and break up the prairie where the year before the range cattle browsed undisturbed save at the season of the round-ups, and to-day the traveler can see on the border line between Nebraska and Wyoming sod corn growing on the hillsides where a few years ago the oldest settlers would have told him nothing would grow but the grass of the prairie.

Such changes baffle the predictions of the most experienced Western men. We see regions, once mere deserts, change by rapid steps into districts as desirable for farming as our most fertile States, and time has in a hundred instances given the lie to people who used to say that such and such a county would never be settled up. All this gives rich promise for the future of that portion of the West which has in the past been noted for its aridity, for it has been most clearly established that water is the only requisite to make fruitful any soil on the plains or in the mountains. On the lower lands, where the nights are not too cold and the summers are long, any crops may be grown which can be produced in Iowa or Illinois. Higher up in the mountains, wheat, oats, barley and root crops yield an abundant harvest to the farmer.

This is a long digression, but it seemed necessary to show what is to be the future of the country once spoken of as the "Great American Desert."

This is preëminently the land for the poor man, but only for the poor man who is willing to work hard. He can raise enough to support his family, and if he has a few cows their increase will in the course of a few years make him well-to do. I spent a night a short time since in the cabin of a settler, who with his wife and four children had located about forty miles from the railroad. He had ten cows, a team of horses and a mowing machine. From the cows his wife made enough butter to pay the living expenses of the family. He puts up hay for the stock in summer and then hires himself out to neighbors at good wages. His calves and colts were in fine condition, and everything pointed to a most comfortable future for this sturdy, energetic settler.

Who can tell how many families there may not be scattered over the broad West, who from similar small beginnings have attained by industry and thrift a competence, or even wealth.

The great wheat lands of the Red River valley are presumably all settled up by this time. It is here that those enormous farms are located which extend further than the eye can reach, and upon which in harvest time an army of laborers are employed. One of the largest of these belongs to a firm of which Mr. Oliver Dalrymple is the chief. They own about 75,000 acres or 117 square miles.

Not the least remarkable feature of this vast wheat country is the rapidity with which it has been developed. The transformation from wilderness to grain fields has all been wrought within a brief period of ten years. There is but one agent to accomplish such a work—the railroad. It will be readily understood that until the building of the Northern Pacific Railway all this country was inaccessible, and that the settler or farmer, if he located in this region, could not get his products to a market. There were, to be sure, a few cattle raised in Western Montana fifteen years ago, and these were for the most part driven to the ranges to the southeast and then sold, but of purely agricultural products no more were raised than could be consumed by the settlers. The completion of the great northern highway from ocean to ocean, speedily changed all this, and settlers have swarmed in at a rate which seems almost incredible to those who have not visited the region since the railroad was in operation. The Northern Pacific Company have pursued a wise and liberal policy in selling their lands and have thus attracted settlers in great numbers. The consequence is that they have this year between 70,000 and 80,000 beeves to transport, besides an amount of wheat which it will severely tax the road to handle. The yield of wheat—in Dakota especially—is said to be much larger than last year, and extra preparations must be made to care for it. Besides this, it is reported that vast quantities of wheat are to be shipped east from Washington Territory over this road instead of going by sea from Portland. The Northern Pacific has made low rates from points in Washington eastward, so low, in fact, as to assure the farmers of that country better prices for their wheat than they would be likely to receive by shipping it west. Besides this transportation from points directly on the line of the Northern Pacific, that road has made arrangements for practically draining the whole Territory. A St. Paul paper referring to this says:

> It is now proposed that barges be built on the Snake River to carry the wheat delivered at points on that stream, to Ainsworth, whence it will be taken by rail to Duluth at the same rate charged from Cheney and other points in Washington Territory this side of there. Heretofore all this wheat has gone West, a great deal of it being shipped direct to Europe from the Pacific slope. For several years past, however, this has not proved a paying business, and just at present grain shippers are not only willing but anxious to ship East. The Portland *Oregonian* of recent date discusses this question at considerable length. Regarding the shipping of wheat direct to Europe, it says:
>
> "At particular times there have been good profits, and at other times prodigious losses. The conditions of the trade here make it a very hazardous business. Distance from the market is so great as to defeat all calculation as to what prices may be by the time cargoes arrive. To ship wheat from Pacific ports to Europe is little else than a gambling enterprise, and during some years past the 'luck' has run constantly against the shipper. His grain has arrived at its destination to meet a steadily falling market, upon which prices for some time past have been lower than at any former time for a century. It is no secret that during the last two or three years shippers of grain and flour have been 'hurt' severely."

As has been said, the Red River wheat lands are for the most part occupied, but all over the plains from the Missouri River westward there is railroad and government land in abundance which only awaits the settler's plow to become as productive as that which is now being successfully farmed. All through Western Minnesota and Dakota the railroad passes through what seems almost like a continuous farm. The broad fields of yellow wheat, a part of it now fallen before the reaper, stretch away as far as the eye can reach. Now and then an extensive field is reached in which thrifty oats nod their tasseled heads in the passing breeze, and near each dwelling the darker green of the potatoes, dotted with purple and white blossoms, bear witness to the varied capabilities of the soil. In one or two places patches of sod corn were growing, and very good corn it was, too, notwithstanding the general opinion that the climate is too cold and the summers too short for corn.

Everywhere the bottoms and bluffs are now clothed with a vegetation more luxuriant than that of bygone years. In Western Dakota wheat now grows without irrigation on hills that ten years since supported only the scantiest growth of herbage. The bad lands of the Little Missouri, too, have lost their character. Formerly they were literally bad lands—*mauvaises terres*—on which nothing grew save an occasional greasewood bush, or here and there a mat of cactus. Now the term has lost its applicability. A short growth of nutritious verdure clothes their slopes, and seen in the slanting rays of the western sun, they are no longer gray, harsh and forbidding, but look like the terraced bluffs of fertile Iowa, softly green, like crumpled velvet.

AUGUST 1, 1885.

LAMINGTON RIVER.

I HAVE since camped by far nobler streams and seen the rush and felt the stroke of more splendid fish, but no days have ever so filled the longings of my soul as those spent on the Lamington River. Of course it was because I was a child; but childhood is an important part of life, and if the soul is indestructible, so perhaps are its impressions. And if it carries to the great hereafter any of the scenes of this life, will not the pictures of childhood be at least as bright as any?

The Lamington was one of the branches of the Raritan River, in New Jersey, and was called a "river" by all the country folks; though it was, in fact, but a creek, and when I last saw it had dwindled away until it was little more than a respectable brook. For five miles or more above the old village of Lamington I knew every hole and pond and ripple it contained; there I spent the greater part of my school vacations, and, rain or shine, every day was most piously devoted to its worship. Its banks were lined with beech and hickory along the low grounds, mingled with oak and birch, and sassafras, persimmon, ash and gum trees where it grew higher, and hemlock and spruce, with wintergreen springing through the pine needles beneath, where it rolled still higher. Here and there it opened into meadows, and wound through tangles of grapevine and jungles of blackberry and thimbleberry to lose itself again in deep, dark woods of hickory and oak.

Even now no part of my life seems better spent than the long summer days, when I sat by its shady depths with rod and line, and heard the mellow call of Bob White from the neighboring field, while the whistle of the upland plover, so far-reaching yet so sweet, fell from the distant sky as he passed over to the rolling uplands beyond. The chipmunk that played along the old stone fence, the little red squirrel that sat chattering or flirting his tail on the hemlock bough overhanging the water, and the gray squirrel that made the leaves crash beneath his spring in the woods behind, all seemed then a part of the brook itself. So did the meadow-lark, whose golden breast with center of jet shone from the mullen top in the meadow, the robin whose piping came on every wind, the highholder showering golden light on his way to the wild cherry trees, the kingfisher that sprang his rattle on the dead limb above the stream, and the heron that lit sometimes in the shadows, staring for a moment in solemn surprise, craning his neck this way and that, and walking thoughtfully about for a moment before concluding that he was safer further up stream. So, too, did the woodpecker, whose scarlet head and black and white coat were often mirrored in the water where my cork was floating as he hammered at the high dead limb above; and so, too, as much as all of these, did that mysterious sound that from the hemlock and laurel-clad hill beyond, on the dense, swampy jungle that I never dared penetrate, always filled with awe my childish heart—the drumming of the ruffed grouse. I was not yet old enough to be trusted with a gun, but I used to sit there almost wild with thoughts of the days that were to come, little valuing in comparison the days then passing.

With the exception of that faint discontent, those were to me days of almost perfect bliss. Often the cork and quill dived far under before it had fairly settled upon the water; and big chubs came flapping out almost as fast as the baited hook could be recast. Sunfish scattered light from all their brilliant scales as they thrashed about in air; and many a solemn catfish came struggling up to pierce, perhaps, with its sharp spines, my too eager fingers. Many an eel, too, wriggled off the hook as he came to the surface and got a glimpse of the upper world; or, if he staid on, tangled the line into a Gordian knot. And when was there such excitement as when the big eel slipped from the hook upon the wet grass upon the bank? What vain stamping and grabbing of grass instead of the eel as the squirming slipperiness eluded my most desperate efforts! Seldom has sorrow been more deep than when the slimy prize slid with a saddening plump into the water.

Who could forget such nights as those on which I went bobbing for eels, when the circling lamps of the fireflies glimmered around me and the stars twinkled in the glassy water, while from the darkening dome above came the cry of the nighthawk, and from the big tree the hoot of the owl, and over the water the whistle of the woodcock's wing as he passed from shore to shore through the gloom? What a thrill the jerk upon the bob, or the grating of the end of the pole upon the bottom of the brook then caused, and what delight was mine when the writhing eel with teeth entangled in the linen thread was lifted over the side of the boat and fell struggling upon the bottom among a score of squirming companions. Through the falling shades of night came the musky smell of the muskrat, and perhaps I could see the rippling wake behind him as he clove the dark water. There was companionship, too, in the night heron, whose long, white plumes I could perhaps dimly see as he descended upon the shore beside me; in the mellow voice of the whippoorwill that came from the bushes or grove beyond him, and in the deep bass of the bullfrogs that sounded from the pond above. Little did it matter then that the old country-made scow pitched and rolled and leaked or that the mosquitoes bit through my summer pants.

The mill pond contained treasures in those days. The fact that it all belonged to my uncle was one entirely too big for my childish mind to grasp. The long, trim form of the pickerel lying in the sunny openings left among the lily-pads or the wake left by his swift rush as in later days he came to the glitter of the revolving spoon hook, and the tug upon the line as he found himself deceived by its bright promises, were nothing compared with the day when, after days and nights of patient toil, the net was completed and we started out to drag the mill pond. Though its floats were clumsy blocks, its sinkers old iron nuts from the blacksmith's shop; though its meshes were uneven and its "bag" wholly imaginary, yet never in life shall I complete any work upon which I shall look with such pride as I did upon that net. Never again shall expectation so consume my soul as when my cousin and I first swept the pond with it, and finally got its ends upon the shore and carefully drew it in, with alternate chills and hot flashes gambolling along our spines, until the supreme moment arrived when we could feel the fish strike against the net and see the commotion in the water as the net grew smaller and smaller. So intense was the strain upon our nerves that when at last the "bag" was drawn ashore the sight of its glistening and flopping contents was more like relief from some dreadful suspense than the culmination of fulfilled hope. No string of trout hanging in the light of the camp-fire by the rushing mountain stream has ever since looked so grand as the half-bushel of suckers and chubs, with a few sunfish larger than were ever caught upon the hook, two or three eels larger than the bob ever lifted, a catfish or two, together with a pickerel that we felt sure weighed ten pounds, and such a snapping turtle as we felt certain had never before been seen.

Wondrous, too, in its resources was the mill race in those days. Even the smell of the water that ran away from the dark, dripping wheel awoke tender sensations, and as I dangled the line through the openings in the sawmill floor into the foaming saw-dusty water beneath, the fish that came out seemed better and bigger than those caught elsewhere. When the mill ran long enough to stop the flow over the dam and lower the pool below it, I waded around there with spear in hand and unrolled pants, and caught many a sucker lying in the shade of the big stones. That was even better than watching for them by torchlight on the first warm nights of spring in the brook at home, to catch them with spear or stick as they struggled over the rippling shallows. And then, too, when the water was high and a broad sheet thundered on the apron of the dam, the pool below it had other attractions, and such catfish and such eels as it contained could be caught nowhere else.

When last I revisited this old stream, after long years of absence, I found it sadly changed. The leaves of the spreading beech were pictured as of yore in its glassy waters, and the grass that overhung its banks was as long and green as ever. The vine that overwhelmed the sycamore by its side was still full of fox grapes and bubbling joy of the bobolink as he hovered over the nest in the meadow was as clear and sweet as before. But the bright fish that shone in its waters and the life that enlivened its banks and groves, all that made it the first thing to which I ran in the morning and the last by which I lingered at night—all these were sadly changed. Beneath the bridge where I so often lay and watched the sunfish, shiners, red fins and silver fins darting from a hundred directions at the crumbs I dropped, I saw but a few timorous minnows scatter at my approach, while from the old brier-grown fence by the orchard near by came the chirp of the English sparrow instead of the flute-like call of Bob White. Where the big bullfrogs once shone in green and gold upon the sunny slopes of mud only a lonely snipe teetered his way along, and swallows and butterflies gathered mud, while the smooth surface of the pond beside was unbroken by the rippling circle of a rising fish. The black turtles that basked on the old log seemed fewer and smaller, and the rustling of the harmless water snakes as they slid from the mass of brush or driftwood into the water was quite an event. Even the little crawfish leaving a muddy trail along the bottom as they shot backward under some stone, the little eels, pollywogs and hair worms that wiggled about in the warm shallows of the little inlets and tributary spring-runs, even the skaters that played over the surface and the little black water beetles that circled in the eddies, all these seemed to be disappearing. T. S. VAN DYKE.

SAN DIEGO, Cal.

UNCLE KELLUP.

THE kindest-hearted, quietest-mannered, nicest old fellow you ever met, with all the instincts of a gentleman and a sportsman. But when I say sportsman, let it not suggest the wealthy gentleman of leisure, who on the first day on which the "law is off" may start promptly for the woods with his retinue of dogs and followers, and a thorough equipment of all the modern implements of slaughter.

No, a stern fate long ago decreed that Uncle Kellup should every morning plod his way down town and up a rickety flight of stairs to a musty office, where he takes his position on a high stool and resolves himself into a calculating machine; repeating the same performance year in and out every day of his life, excepting Sundays and legal holidays.

For years and years he has looked forward to the time when he should be able to take a long vacation and set out for that hunter's paradise over the road he had so often trod in his imagination; but somehow he never seems to catch up with the mortgage on the little house, and the only son, who should have been a prop to the old man in his age, went to the bad and died with a long list of creditors. So Uncle Kellup plods quietly along and always will.

But if you would see him at his best, you should come with me some evening after supper to the cottage. Let us peep through the keyhole. The tea kettle is humming contentedly, the clock ticking monotonously, old Dodger is stretched at full length before the fire, and there, drawn up to the table at one side, is Aunt Susan, with her knitting, while opposite is Uncle Kellup, comfortably arrayed in a pair of very large slippers, while he polishes his glasses preparatory to a perusal of the last number of FOREST AND STREAM before him on the table. Then he gathers up his paper and looks down at Dodger for a moment over his spectacles while his features are widening into an expectant smile.

And such a smile. You could see to read by it.

At first, as he reads, a shade of dejection settles on his countenance, and you know he is envying some fortunate fellow the glorious time he is having with choice companions where is abundant game and glowing scenery. But soon his features relax again; he chuckles quietly or nods in approbation, and at length breaks out in a hearty laugh, while Aunt Susan looks on with an indulgent smile and Dodger wakes up with a sharp bark and his features all wrinkled into an inquiry as to what the matter is anyhow.

So then Uncle Kellup must needs get down the old muzzle-loader, and although Susan reminds him it was thoroughly cleaned night before last, he takes it all apart, wipes away a speck of dust, puts it together again, fondles it lovingly awhile, and then takes a good, long, careful aim at a fly on the ceiling.

"Aha," says he, "my fine fellow, if you were only a quail or partridge now. Hey, Dodger?"

And then he gives Susan a sly wink as he shoulders the gun, and makes a great stamping noise of preparation as he moves toward the door, as if to start right off for the woods. But the old dog has been fooled too many times before, so now he only wags a little and stretches and yawns and throws up his muzzle and yowls once or twice just to humor the old man.

So, now, if we take advantage of the commotion to enter, Uncle Kellup will greet us cordially, and soon will be in the midst of that yarn about the woodchuck, or skunk, or whatever it was, and when we catch a quizzical glance from Aunt Susan behind her knitting, we all slap our thighs and shake our heads and roar so heartily you would never suspect we had heard that story forty or fifty times before.

Every Sunday morning he goes to church, but in the afternoon, especially in the autumn, when the foliage is turning, you will see him and Dodger trudging along some country path, through the gap in the wall and across the lots, till they come to an obscure bramble pasture near the woods. And here they dispose themselves comfortably on a mossy knoll and doze away the afternoon, listening to the note of the bluejay in the woods, or an occasional crow passing high over head, while in the intervals the old man indulges in a confidential little chat with Dodger, reminding him of what a fat, lazy rascal he is getting, and showing up his many misdemeanors and shortcomings, and finally smoothing it all over by remarking, "But there's no telling what you might have been, Dodger, if you'd only been trained."

Then a gray squirrel comes whisking toward them along the Virginia fence, and when he pauses, quite close, Uncle Kellup is all excitement, shaking his stick at the dog and admonishing him to "lie down, sir," although the animal had not the remotest intention of doing anything else. Then the squirrel, satisfied with his investigations, goes scampering back the way he came, with his handsome tail flaunting after him, while Uncle Kellup draws a bead on him with his cane and remarks to Dodger how nicely he would have popped him if he'd only had the gun. But he wouldn't. He wouldn't hurt a hair of its pretty little head for the half of Solomon's kingdom.

Then he suddenly realizes that the afternoon is gone, the bars are down, the cows all home and milked, and he and Dodger go trudging down the path with visions of cold supper, a mild reproof from Susan, and blue Monday in the distance. JEFFERSON SCRIBB.

DIFFERENT SORTS OF OUTERS.

ONE must be in the fashion or be a nobody. It appears of late that voluntary testimony is the rule, and if it please the honorable court I will step into the witness box and be sworn in the case of The People vs. "The Kingfisher Club," et al.

It must be half a dozen or so of years since I first met the gentlemen composing the Kingfisher Club, and they have since at various times "done" the Intermediate Chain of lakes pretty thoroughly, and have camped at different points along our valley. My extensive acquaintance throughout this region renders it extremely improbable that any members of this club could have been guilty of any serious infraction of the law or order, without its coming in one or another way to my knowledge.

As a brother angler and an old sportsman, heartily in sympathy with the laws for the better conservation of such game as remains in our once notable hunting grounds, I take pleasure in stating that in all the talk I have heard about this club, no whisper of any illicit practices, of whatever nature, has ever reached my ears. These gentlemen, so far as I have ever learned, have uniformly met their obligations, and have left behind them a most credible record, and I cannot believe that, had they been otherwise disposed, they would have made an exception of the Intermediate region.

This testimony is not only voluntary, but a little more than that—in a sense—as I am inclined to think that Old Hickory has what the Scotsman called "a scunner agin" me, since I took occasion, a few years ago in your columns, to correct him in a loose statement in natural history, which he had imbibed while drinking in the waters of our springs and the yarns of some of our smooth-spoken inhabitants, at the same time. He took up the cudgels rather savagely in behalf of his instructors, and I have not seen him since. I bear him no ill will, remembering that he is just a little—a very little—"short in the temper," and prone at times to use hard words—possibly regretted afterward. That he can use them, any one one within hearing of his progress through the swamps of Cedar River could testify, and this brings me to another part of my subject.

There are Cincinnatians, and Cincinnatians. I have met a good many of them, and of several classes. Of these this paper treats of three only, the sportsman, the "dude," and the "dead-beat." I use the term "dead-beat," because, although inelegant, it expresses concisely the idea I desire to convey.

But about Cedar River. That is where I met the dude. He was fishing for trout. So was I. He was pottering around the lower bridge, and I took the brush for it and tramped up stream. Just how many I caught doesn't much matter at present, but the great fact which remains indelibly imprinted upon my memory is that at a certain point, I was standing with my back to the stream, the normal temperature of which is in midsummer considerably (as I think) below the zero of Fahrenheit, and stepping backward, I slipped, and a branch caught me just above the ankles. Over I went instanter, and morial man hath seen no prettier dive. Viewed as an acrobatic performance it was a distinguished success, and would have brought down the house. The top of my old hat struck squarely upon the surface of the icy stream, and the tenant of the tile aforesaid incontinently disappeared beneath the aqueous.

It was damp and chilly, and I emerged as hastily as my dignity would permit; walked up into an open space in the forest, "shucked" myself, and dried off in the broiling sun.

Then I fished down stream to the bridge, when I again encountered the dude. He met me with a stare of horror, which was soon explained by his trembling utterances. "W-h-y," said he, "I f-e-l-l i-n-t-o t-h-e w-a-t-a-h." "Ah?" said I. "Y-e-s, I fell into the w-a-t-a-h c-l-e-a-n u-p t-o m-m-m-y w-w-a-i-s-t." "Did you? I beat you. I fell in all over." "W-h-y, arn't you a-f-r-a-i-d you'll catch c-o-o-o-o-l-d?" "No, I guess not." "I am afraid that I s-h-a-l-l catch c-o-o-o-l d, I t-a-l-k s-o-o-o q-u-e-e-e-ah."

Class III.—(dead-beats).

The following is a copy of a postal card received by me in the summer of 1882 (I inclose the original, somewhat the worse for wear but still legible):

CINCINNATI, Aug. 21, 1882.—Mr. ——: A party of us will leave Cincinnati on Aug. 31, and will arrive at Russell's (if we make connection with the boat at Traverse City) Friday evening, Sept. 1. Can you meet us with a wagon? If we do not make connections will arrive Saturday next, Sept. 2. Meet us at Russell's and oblige E. H. H.

Any person desirous of learning the full name of this man can obtain it by sending a stamped and addressed envelope to the editor of FOREST AND STREAM.

My reason for publishing his card is that he, as various others had done, wrote me in order to facilitate his movements during his summer vacation. It was a matter in which I had no personal interest, but as I had before done in many similar cases, I requested an honest and trustworthy teamster of my acquaintance to be at the landing specified at

the appointed time. He, accordingly, put in two days as requested, but Mr. E. H. H. and party were not to the fore.

A few days after I happened to learn that they were camped on Lewis's Island; and about that time I chanced to meet one of them, and sent by him a note to Mr. E H H. stating the facts, and adding that I presumed—which I certainly did—that he would pay the teamster for services rendered. This was the last I saw or learned of that party, except that I heard, and did not doubt, that they had victimized another teamster near Bellaire.

Now, had I written and sent to Mr. E. H. H. a request that he should on a given day have in waiting a hack at the Burnett House or a dray at Pier No 7, what would his feelings naturally have been had I failed to put in an appearance, or to fee the drayman, or to compensate Mr. E. H. H. for the ducats he would have appropriated to such use? What sort of a party is it whose leaders can unblushingly commit such acts?

A genuine sportsman should be a man of honor—*is* a man of honor; and to such an one, be he peasant or be he prince, I am ready to extend the right hand of fellowship. Not to every man whose cast of flies shall fall upon the wave "like thistle down," whose shot is death, can I apply the name of "sportsman." And to the blackguard, who, with gun or rod, goes through the world like Sir Artegal's iron man Talus, with his flail, "beating" every unsu-picious victim within his reach, I say, in the words of the shipwrecked Hibernian, "The back o' me hand and the sowl o' me fut t' ye." KELPIE.

CENTRAL LAKE, Mich., Oct. 22.

IN THE FORESTS OF NEW BRUNSWICK.

AFTER our log canoe was made and launched into the still water on the head of the Little Southwest Miramichi, a few miles west of the blazed line which marks the division between the counties of Victoria and Northumberland, we retired to our little cotton tent for the night. This still water of the Little Southwest is bounded on either side by barrens, which, however, are not extensive and soon meet the base of the high, hard wood covered ridges, with which this country abounds. For four miles there is no visible motion of the water, which is dark and deep, and here is a favorite haunt of the black duck, the most wary of birds. Beaver too were at work, as was shown by the freshly gnawed wood which we saw on the banks of the stream; indeed one of our party who had walked down from our little tent to the water caught a full view of one beaver swimming about in the afternoon.

After our night's rest we packed up our blankets, cooking utensils and food which we placed in the canoe, which two two men were detailed to paddle to the foot of the still water, the rest of us following the shores, over hummocks and among hardhack bushes concealing many a hole which the industrious otter had dug for getting readily out of or into the water. Signs of otter were numerous and many were fresh. At the distance of three miles we came to a narrow place in the still water, where the scrubby spruces which stood scattering over the barren grew close down to the water's edge. The brook here was shoal, and there was a rocky bottom formed by a ledge which crossed the barren for a long distance, its top being only a few feet above it—a singular formation looking like an entrenchment, extending from one side of the barren to the other, and through which the still water in the course of time had worked its silent way. At this place, called the "Jaws," we met the canoe. We saw here a pile of bones whitening in the sun and rain. They were those of the *loup cervier*, or Canadian lynx. One of our party, a hunter of great experience, had taken advantage of the known dread of this cunning animal to show himself in a barren or open piece of land, and having set his traps here had caught twenty-six of the animals two winters before, and it was the bones of these which we saw.

A walk of a mile brought us to the foot of the still water, where the stream ran among granite boulders and over little rapids, and where our canoe would be of but little service to us; we took our things out of it, therefore, and carried them up to an old hunting camp which we temporarily repaired for our night's lodging, part of us sleeping outside under the tent. I here noticed in one of the wooden sable traps the bones of an owl's head. The bird had evidently been robbing the trap when fate overtook him. The little Abenaki Indian, one of our party, called the owl "koo koo kus" in his language; a word more expressive than our name for this bird. The Canada jay or moose bird is greatly hated by the hunters, as he also will follow their lines of deadfalls for miles and steal the bait out of them, rarely losing his life in the attempt. This bird at the time when trout are spawning will follow the shores of the streams hunting for and devouring the ova.

We were now nearly in the center of the great New Brunswick forest, on this elevated land firs grew so thickly that they incommoded our traveling and we concluded that some of our party should take their axes and cut a trail through the woods to the foot of the rapid waters on the stream, a distance of about six miles, while the two canoe men poled and dragged the empty craft down the rocky stream to that point where it would again be of use to us. We did not get more than three or four miles before night overtook us, when we pitched our tent on the bank of the stream in a thick growth of large mixed woods. The soil in this part of New Brunswick is of no value, indeed, although there is a large forest growth, the whole surface of the country, when the moss is removed, is nothing but a mass of angular stones, generally of small size. So that this country can never be of any value for agricultural purposes and is only fit for the production of timber and as a cover for game of various kinds. The next evening brought our party to the foot of the rapid water where, after rippling over a gravelly bed for a few yards, it was lost in another large still water, or, as it is appropriately called by the New Brunswick lumbermen, dead water, a very appropriate name. The canoemen had brought the canoe down and had hauled it up on the little beach, and I had gone off to look out a good camping ground.

On my return to the party a strange scene met my view An English gentleman, who was accompanying us as a friend, was just taking the hunter's rifle out of the canoe, and drawing off the cover hastily, evidently there was something up. The Abenaki boy, Frank, was standing motionless on the shore gazing steadily into the trees on the other side of the brook, where there was a high bank. As I drew near he looked at me, and pointing with his finger at the thicket on the opposite side of the stream, said in a whisper, "Moose, moose." Directing my eyes to the place where his finger pointed I saw, sure enough, a great head with majestic horns looking out of a spot among the thick foliage of the dark spruces, a vignette, as it were, bough-surrounded. A moment more and the Englishman was at hand with the rifle. He raised it slowly, taking deliberate aim at the noble forehead which could not have been more than 150 feet from him, he fired. As the smoke slowly passed away I looked into the darkness of the woods and saw again that grim head motionless as before. I rubbed my eyes, as I said to myself this can be no moose's head, it must be the gnarled and tangled boughs of cedar. The breechloader was charged again in a moment, again raised, aim taken, and fired. There was a crashing of branches, and as the smoke again rolled away a blank dark space was left in the spot where the head had been. The Englishman and the Indian boy rushed over the stream on the trail in the woods. Half an hour brought them back with the usual story of having seen drops of blood in the track, but I believe that the animal went off unhurt. Had it been killed it would have necessitated our curing the meat by smoking, as we had no salt, and this process would have been long and tedious, and thus I was well satisfied at the result. EDWARD JACK.

HABITS OF CRAYFISH.

Editor Forest and Stream:

I have read with much interest the communication in your columns by Mr Tarr, entitled "Habits of the Crayfish." What he says of the burrowing crayfish (*Cambaro diogenes*) was of special interest. I have seen the chimneys of these solitary creatures, and it has often been a matter of wonder to me how they managed to pile up their frail structures to such an altitude, and whether in doing so they serve a useful end or merely gratify an æsthetic taste.

In the North Mississippi prairies we have another species of crayfish, or as they are locally called crawfish, which burrow in the ground; but apart from this are very different from the *C. diogenes*. Underlying the soil of the prairies is a stratum of soft limestone at varying depths. The crayfish burrow down to this rock and here excavate a cistern which contains many gallons of water, accumulated by seeping through the porous soil and retained by the impervious rock. Thence they sally forth after a spring shower and cut down and carry into their burrows any "tender green herb," not excepting the growing corn or cotton. So thoroughly do they perform their work, that the ground, in localities where the crayfish are thick, is kept perfectly bare of vegetation. As may be supposed they are very hurtful to the crops, in many places preventing the farmer's getting a "stand" and at other times delaying the planting until May.

We have a few of the chimney-building crayfish, but they are said to do no damage to the crops, and are found always near the branches and ditches or in the "swags," while the destructive variety are often found in the highest land on a plantation, the chief requisite for their favorable existence being a considerable depth of soil above the bed rock.

After May 1 the crayfish retire to their burrows, rarely venturing forth, unless there chances to come an unusually wet season. They subsist upon the vegetation laid away in the spring. I have never seen any account of this species of crayfish and am ignorant of its technical name. I suppose, however, that it has been studied and classified, and I should be glad to learn more about its habits, and especially glad to receive information of some cheap and effective method of destroying it, as I have some fifty acres of otherwise very fine land which is rendered practically useless by the presence of the crustacean. WILL.

ABERDEEN, Miss.

THE BIRDS GONE.

IT is now some time since the summer residents left these parts. A first migration took place on Aug. 25. We had a cold rain on that day, and the next morning the thermometer registered 50°, with a cool north wind that continued blowing for a good part of two days. At this time many robins, catbirds, thrushes, and orioles disappeared. I was more surprised at the robins and catbirds going than I was at the thrushes and orioles leaving. It could not have been the want of food that sent the robins off, for the cherry trees that they had fed upon so much during the summer were still loaded, and for more that two weeks after their flight the ground was covered with fruit. We have thought that this early migration accounts for the return of the same birds for several years in succession. Those that take their flight in August escape the robin slaughter that commences here ostensibly in October; but I am afraid it sometimes begins before that, and it does not end until the last redbreast leaves these parts.

But by the 30th of August there were very few robins present, and the number of catbirds was still smaller. Nor did they seem to me like birds that had been reared in the vicinity. They were wilder, and did not appear to know where the cherry trees were nor the elderberry covert.

One of the last birds to leave was the warbling vireo (*Vireosylvia gilva*). I heard him sing frequently up to the 30th of August, after the other birds had gone, and when the mercury stood below 65°. On the 30th of August I left home for ten days. When I returned I found neither robins nor catbirds, and all the summer residents except the phœbe birds had taken their departure. We had a cold storm the first week in September, and this seemed to complete the migration in this place.

During the latter part of July several little families of nuthatches (*Sitta carolinensis*) were around. They left my feeding places early in May, and I did not notice them until the time I have mentioned. It was easy to see that many of the birds were young ones and had not acquired the facility of running up and down and around the trees that their parents had. And I also observed that one or two of the birds—the old ones, I supposed—would almost invariably fly to the pear tree where they had fed last winter and examine it most carefully, scolding meantime while they peered into the knotholes. However, some of them have already commenced to peck out the fat that I provided during the first week in October. One of them spent the greater part of the morning of the 17th in transferring it to several locust trees just across the way.

What applies to the nuthatches in respect to their summer visits, applies with equal force to the chickadee (*Parus atricapillus*), only I did not notice them around until the first week in August, when almost every day a troop would come and saucily lisp a single note as they fed around or near the old places.

The downy woodpecker (*Picus pubescens*) never seemed to leave me at all even for the months of June and July My own opinion is that he raised one brood in the dead limbs of an old chestnut that stands in the field opposite. Where the other nest was I have no idea. It could not have been very far away, though, for young and old were around all the summer. All these residents, I flatter myself, are preparing to make their home for the winter in the vicinity of this house.

I observed that while the nuthatches and chickadees sang through the winter and spring, they were as a general thing almost silent when the summer songsters arrived. The first date that I have of the nuthatch singing is Jan. 3, 1885; the chickadee was some weeks later. They were usually heard on fine, pleasant mornings when the thermometer stood among the twenties, or higher. A. H. G.

SCARBOROUGH, N. Y.

SKELETONS OF DOGS.

Editor Forest and Stream:

It is very desirable that the Department of Comparative Anatomy of this Museum should have, for study and exhibition, a good series of skeletons and crania of thoroughbred dogs to illustrate the great variety of size and form which exists among the various breeds. Considerable progress has been made in this direction, but owing to the great difficulty of obtaining good examples of certain important races, many desirable forms are still lacking. Foremost among these are the greyhound, mastiff and St. Bernard, as exhibiting either the extreme of size or lightness of structure. The bloodhound, staghound, sheep dog and thoroughbred foxhound are also very desirable. Should any reader of FOREST AND STREAM be so unfortunate as to have one of the above mentioned dogs die, it would be a decided favor if he would kindly take the trouble to pack in a box or barrel and forward to the museum. Some object to having any disposition other than burial made of their favorites, but there are also many who would be perfectly willing to have a valuable dog placed after death where its value and good qualities would be perpetuated. FREDERIC A. LUCAS.

Asst. Dept. of Comp. Anatomy, U. S. National Museum.

NOTES OF THE WILDFOWL.

A FEW ducks have visited the Schuylkill in this vicinity during the past month. They were terribly persecuted during their stay here, and did not tarry long. Oct. 18 a flock of twenty-five or thirty took up their quarters along the shores of Barbadoes Island, and although it was Sunday a large number of boats and shooters (I will not say sportsmen) were after them all day, and before night the most of them were driven westward beyond Catfish Dam, four miles from here. I was out on the river in the afternoon, and accidentally chased two ducks within easy range of three young men in a boat. One of them raised a double muzzle-loader and snapped twice but it did not go. They then called to me: "Have you any caps?" I answered, "No; I use a breechloader, but not on Sundays." They then explained that they had killed a duck in the forenoon, had exhausted their supply of percussion caps, had sent a boy to a drug store for more, but the druggist had sold out and the gun stores were not open. Here was an illustration of human thirst for gore. These young men were rowing a 300-pound boat around all afternoon after the ducks, snapping the hammers of their gun at every opportunity, hoping that it might go off and kill something. Such perseverance was deserving of a better cause.

In another boat a young man was practicing with a revolver. He would get in one shot on the water at about twenty yards, and then give them two more on the wing. The bullets did not hit the wings in any instance, but the spectators on shore were in great danger.

On the following day I went out and killed two ducks, presumably the only ones remaining within two miles of the borough. On my return to the boat house I met a man who informed me that one of my ducks was a "crow duck," and said that if I would throw it away he would give me four good ones, and further informed me that he was a great duck hunter, and had killed sixteen the day before. I thanked him and told him that I would risk the crow, and had enough for dinner. Such men make me tired, and there are many hereabouts. There are sportsmen here, however, and the fact that several copies of FOREST AND STREAM reach here once a week is evidence of the fact.

I find that a light boat with bow-facing oars is an excellent combination to use in the pursuit of ducks, and I probably have killed more than my share, considering the large number of shooters and the small number of ducks killed. The cartridges used are brass, and were loaded more than three years ago. Not one has missed fire up to date.

NORRISTOWN, Pa., Oct. 31 E. A. LEOPOLD.

Great preparations are being made at the Havre de Grace and Gunpowder River ducking grounds for the opening of the season the beginning of November. Many blackheads and redheads have taken possession of the flats at the mouth of the Susquehanna River, although canvasbacks have not yet arrived in quantity. Since the storm on Thursday and the clearing up cool weather of the ending of the past week, more of the latter variety have come on and may be every day expected in increased numbers.

The flight of ruddy ducks or "stiffies" to our Delaware river and bay is something enormous, and we hear from all quarters that this stupid little duck is unusually plentiful everywhere this autumn. In our Philadelphia market many are being palmed off on the unsuspecting for teal. Of course they are picked when thus sold, and in general appearance (save the head) in this condition very much resemble the latter variety. HOMO.

PHILADELPHIA, Oct. 31.

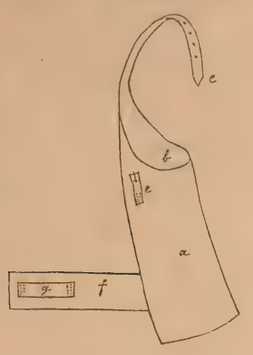
Wild geese, crane and brant made their appearance here in considerable numbers about Oct. 10. Mallard ducks appeared about the 20th. As soon as it gets a little colder in the north all will be here in large numbers. They are in-

creasing daily now, and we will soon have splendid shooting. Quil are exceedingly plenty. Open season Nov. 1, when the slaughter will commence. E. R. W.

LARNED, Pawnee County, Kan.

A month ago sandhill cranes and brant were flying south over us, and teal ducks, the only kind I have seen, were plentiful in the river and ponds. It is said that wildfowl will be plentiful here in November. RAMBLER.

JOHNSON COUNTY, Kan., Oct. 26.



Ducks are beginning to make their appearance, also a few geese. The first brant was bagged in the bay Oct. 19. Two of our sportsmen bagged 125 ducks in an evening and morning's shooting, Oct. 22 and 23. Fine shooting is expected next month. B. C. H.

SAN DIEGO, Cal., Oct. 25.

GUN SLINGS FOR THE SADDLE.

Editor Forest and Stream:

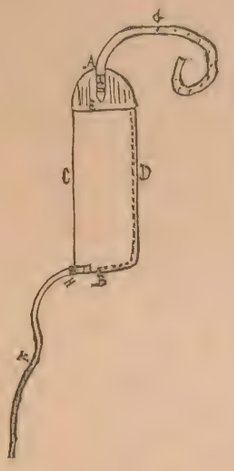
The arrangement for carrying a gun upon horseback, described by "W. E. B." in your issue of Oct. 1, is doubtless very convenient, especially on open prairies, but is only suitable for saddles made after the Mexican fashion, with a high knob on the pommel. I would, therefore, like to bring to the notice of your readers a method of carrying a gun with great comfort and security upon ordinary English saddles, which I am informed are now in general use in the Eastern States of America. The following outline drawing will, it is hoped, make the description clear: *a* is a leather

bucket wide enough at the mouth, *b*, to allow the stock of a gun to pass easily in and out, and deep enough to almost cover the locks. The upper and back part is prolonged into a strap, *c*, which passes through the D on the right side of the pommel of the saddle, and is fastened to the buckle, *e*, outside the upper and rear part of the bucket. At the back of the latter, and near its lower end, is sewn a band of stiff leather, *f*, two inches broad, upon which is a loop, *g*, for one of the saddle girths to be passed through. The band must be of such a length that the bucket will lie at the edge of the saddle flap a little in front of the rider's thigh.

The slope must be regulated by shortening or lengthening the strap *c*, so that when the stock of the gun is in the bucket with locks to the front, the barrel will pass close under the rider's right armpit. A piece of felt or thick blanket stitched on to the part of the bucket which rests against the horse's shoulder, will increase the comfort of the animal.

A bag of cartridges or something equally heavy should be hung to the D on the left side of the pommel, otherwise the weight of the gun in a long and fast journey may twist the saddle round sufficiently to gall the near side of the horse's withers. The advantages of this system are: 1. That the weight of the rider's arm when hanging in its natural position holds the gun perfectly steady at even a hard gallop. 2 That in riding through forests there is no danger of striking the barrel against the trunks of trees. 3. That when the gun is wanted it has simply to be lifted out of the bucket. With a quiet horse it may safely be left standing there when the rider dismounts.

I first read of this system in Galton's "Art of Travel," and practiced it for three years when holding a government appointment in India, where I had to march for seven months annually across the great plains of the Punjab. The only disadvantage connected with it is that, if the horse falls when at a fast pace, there is a chance of the rider being thrown forward in such a way as to break the stock; but this can be avoided by holding the gun in one hand when galloping over dangerous ground.



The British mounted infantry carry their rifles in a bucket fastened to the cantle of the saddle behind the rider's right thigh, the sling of the rifle passing over the man's left shoulder, so as to hold the barrel across his back with the muzzle inclining to the left. This arrangement keeps the rifle fairly steady at a gallop, and the rider, if thrown, carries his weapon with him; but he may possibly, in the act of falling, receive a severe blow from the barrel on the back of his head. J. J. M.

LONDON, Eng., Oct. 16.

Editor Forest and Stream:

The gun sling described in the communication in your issue of October 1 is well known here in California, in so far as its general features are concerned, and has among other points in its favor the great merit of simplicity. It seems, however, to fail in the following important respects for general use: 1. It is adapted only for a Mexican saddle, or some variety similarly constructed, with a high pommel 2. From the position of the gun when in the sling, in the event of a heavy stumble of the horse it is likely to strike the animal about the head or forelegs, and lead to complications. 3. The weight of the gun is not well placed, bearing, as it does, altogether on the horse's withers. 4. "One hand is used to steady it"—the gun—"when loping." 5. It is inconvenient, in that it requires the barrels of the gun to be tied with saddle strings (which are also peculiar to Mexican saddles) whenever one is obliged to walk and lead his horse, which on hunting trips in anything but a flat country will average at least a third of the way. In leading up or down an overgrown trail the gun is liable to catch in the chaparal, and having necessarily no play in the saddle strings, cannot ordinarily swing free when caught; this must inevitably result in delay, inconvenience and possible injury to the gun.

I have for a number of years used a gun sling for the saddle, which while open to some trifling objection, at the same time combines more of convenience and safety than any of a number which I have tried, including that described by your correspondent. It can be adjusted to any saddle, and is equally useful for gun or rifle. Its pattern is of the simplest. Independent of its fastenings it is nothing but a long leather pocket intended to receive the stock of the gun. The accompanying rough sketch and dimensions will serve to explain its shape and construction:

The pocket is made of one piece of thick leather doubled and stitched in the manner indicated in the sketch. The top strap G should be 1¼ inches in width and 3 feet in length, the lower corner strap F should be ½ inch in width and 3 feet 6 inches in length. The following are the dimensions of the pocket: A to B 2 feet, A to E 6 inches, C to D 7 inches—E is the mouth of the pocket. These measurements are taken from a sling which is by me as I write, and while they can doubtless be in some slight degree modified, it would not be advisable to change them to any great extent. The sling is in position on the right of the saddle, in front of the rider's knee, with the pocket at a slight angle, so that the top inclines to the rear. It is fastened by the strap G which is wound about the pommel if the saddle be Mexican or Californian, or passed through A D, which can readily be attached to the pommel of either an American or English saddle and buckled in place. The strap F is passed to the rear under the girth, and forward again to the corner buckle H, where it is fastened. The straps must of course be adjusted to fit the horse and the rider, and this can easily be done in a few moments. The gun is inserted in the pocket, hammers upward, and when so placed with the straps adjusted to give the proper angle to the sling, the barrels rest lightly on the rider's thigh, extending to the rear under his forearm. There is no perceptible jar from the gun either on a trot or gallop; both hands are free; the weight of the gun is so distributed that it is burdensome neither to the horse nor rider. In the event of a stumble there is no danger of the gun or horse being injured, and in leading through the narrowest and most overgrown trail the gun is safe, and if brought in contact with overhanging branches avoids them at once through the play of the straps.

G. E. O.

SAN BERNARDINO, Cal.

GAME IN PIKE.

Editor Forest and Stream:

My forecast in FOREST AND STREAM last year in regard to hunting at and near Milford, Pike county, Pennsylvania, were correct. I said that the denseness of the woods would save pheasants—ruffed grouse—"for seed" and that they should be plentiful this year. So many were saved over that broods were everywhere until woodcock shooting began in July. Then the market hunters scattered the broods, getting "chicken partridges" for the local gourmands and hotels. In this way hundreds of "peepers" were brought to bag and the survivors took to the scrub oaks and swamps. In one sense this was a gain to sportsmen, as ridge hunting does not pay the market hunter as well as swale hunting. Too much ground has to be covered and the "pot" sportsman (!) does not keep the staunch trailing dog needed for such work; or if he has a good animal it is soon spoiled by being taught to tree squirrels and ruffed grouse.

I have just returned from "Little Pike," and can advise those who love to hunt the booming wing monarch of the forest to take a trip there. Better take a good dog used to the work, a cautious, steady trailer if possible, one that will "freeze" at the first whiff of a bird, wait for you to get up and tread as on eggs until he has the quarry cornered and ready for powder burning. Flocks will not be found for the reasons given. But it will be a bad day for pheasants when within easy reach of his quarters the gunner does not put up a dozen birds, and he may see scores. The woods are now, thanks to frosts and heavy rains, well cleared of leaves. Never were there so many thorn, frost, wintergreen and bear berries on the ridges and in the swales, and the birds are in the primest condition. There has so far been one flight of woodcock—a small one—but others must come within the next ten days. The best grounds near Milford for both woodcock and ruffed grouse are Dewitt's Islands on the Delaware, midway between Milford and Port Jervis, the Dunwick Meadows and Yellow Pine Swamp, the Orry Cabin Brook, Pinney's Woods, the Sanvantine Swale, Craft's Brook, the Walker Ponds, Butternut Orchard, Shutts's Farm and Swamp, Goble's, Greening's, and the farms on the Shohola, the Upper Raymondskill and Big and Little Log Tavern Ponds, the De Rialp Swale and the Brink Ponds and the Upper Dingman Creek and Silou Lake.

There are a few deer left, but there are more bear than deer signs. Deer hunting will be a failure this year. Bear hunting will begin when the swamps are frozen.

If the visitor be a keen sportsman not needing a guide beyond a country boy and desirous of a comfortable *pied à terre*, he could not do better than go to Gilbert D. Aselimus's farm on the Sawkill Lake, and land right in the center of a hunting country. If he need a guide to add to his bag and cheer him, he can go to George M. Quick's snug log cabin hunting box on the Shockapee farm, a mile from Milford, and get French cookery, good sleeping quarters, and the use of the best ruffed grouse dog in Northeastern Pennsylvania. Quick is a good sport, belongs to a family of hunters, and can get up a deer hunt on short notice. His terms are very reasonable.

Let me add that it is a good year for cider in Pike county, and that the air of this favored locality has the same tonic effect as ever, also that—*mirabile dictu*—several owners of swamps have stopped summer woodcock shooting. On one thus preserved I shot nine woodcock before the first flight arrived.

Milford is reached by Erie Railroad to Port Jervis and stage. Some "go in" via Erie Railroad and Lackawaxen, Footer's Glen or Hawley, or Delaware, Lackawanna & Western Railroad and Stroudsburg. AMATEUR.

THE BOSTON GAME MARKET.

NO better illustration of the value of stringent game laws well enforced need be asked for than comes from carefully watching the Boston market, especially in the season. Later, when the weather becomes sufficiently cool, heavy shipments of game come here from the West, but up to Nov. 1 it is pretty safe to conclude that the game found in this market is of New England production or from the near Provinces. Well, careful watching and acquaintance with the market police has brought to light the receipt of but one or two deer thus far, although it has been open season in Maine and New Hampshire one month. One deer came through by express—boxed and marked "lambs"—some two weeks ago, but it smelled so badly that a member of the market police ordered it to "the dump." The receiver saved the hide only, and the express company, which brought it out of Maine, will be watched. It can handle but two more deer this season. The Maine game law says: "Three deer, two caribou and one moose" a year, and this the Supreme Court of that State holds as applying to transportation companies as well as individuals. In New Hampshire it is absolute non-transportation from the State.

Upon partridges the effect of the Maine and New Hampshire laws is most salutary. The effect of the new non-exportation law of the latter State is signally noticeable here this season. The game receivers are cursing the law. They declare it has ruined their business. Last year at this time the market was crowded with ruffed grouse. The marketmen said they were killed in Massachusetts and New Hampshire, but unfortunately for Maine then, she has nearly 150 miles of border on the Granite State. The New Hampshire law, which forbids the taking of game out of the State, has been added to that of Maine within a year, and Boston market has no partridges. The marketmen will tell you that the fact is owing to a scarcity of grouse this year, but how does it happen that Vermont has them more plentiful than ever before? At least such is the statement of the receivers, but the New Hampshire border has doubtless something to do with the situation.

It is worthy of note that a majority of the few partridges received here this season have been snared instead of shot. The game dealers encourage this. They say in their circulars: "Send us snared birds, they sell better than birds torn by shot." It means extermination of the ruffed grouse and they know it; it is against the lay and they know it. But what are the compunctions of the shrewd game dealers worth when there is a dollar to be made? SPECIAL.

A WOODCOCK PLAYING LEAPFROG.

A THOUGHTFUL sportman seldom goes out for a day's pleasure in the haunts of that charming game bird, the woodcock, that the bird does not treat him to the sight of some action so full of witchery and abandonment as to remind him of the caprices of his first love, perhaps.

On a certain memorable picnic Tom ———'s first love did play at leapfrog when he was bending over the campfire, which he was trying to blow into a blaze, though she was as decorous as the circumstances would permit of, and sailed over his bent form side-saddle fashion, landing with much gravity, but with disastrous effect, upon the carefully-arranged fireplace. From that day nothing has occurred to remind him of that scene, he says, until yesterday, when he saw a woodcock play four leaps of this game in a cedar thicket, during a hunt which he trusts he may always remember for the pleasure it gave him. Tom and his friend George H——— had made a fair bag, had eaten their dinner and had chased a woodcock up and down a bit of cover until they were tired, when she went over a swale into the cedars. Here they planned out a campaign, which, from the shape and surroundings of the thicket seemed as complete as the Little Corporal's at Waterloo. Tom's friend was to make the attack with the dog, after Tom had placed himself in front. The positions were secured. Each called to announce the fact and for warning lest either should be tempted to shoot in the line of the other, and the dog was sent in. But the thicket was so dense that he sought and found an easier way of entry. This brought him between Tom and the bird. The latter seemed to "sense the situation" She gave a hop over the dog's back; and by the flicker of her wings through the branches Tom saw her alight between him and the dog. There they were in line—Tom's friend, the dog, Mlle. Woodcock, Tom himself, and thickets beyond. She gave them no chance to change their positions, but with another hop and a daring display of her feathers sailed close over Tom's head and lightly touched the ground near to a scrub oak supported by blackberry briers and sweet fern. Tom caught this motion in the corner of his eye as he turned around, for when he was so near to facing her as to have his gun up, she had disappeared behind the little oak, much as a girl's handkerchief goes with a flirt into her pocket. "Here she is," called Tom, and he pointed out to George, who had come up, her place of hiding. They knew to a certainty within six feet of where she was. A delighted look rested on Tom's face; a confident smile was on that of his friend. Even the dog knew the bird was for the bag. Then, in less time than it can be told, came the fourth leap. With a shake of her feathers, another flicker of her wings—graceful, full of abandon—she rose over a low cedar. "Now's the time." What a moment. George in readiness for a second shot, Tom shooting, the dog in a quiver and the woodcock sinking beyond the cedar. Both fired. It was too much for the dog. He lost his self-control and barked.

"Did I hit her?" asked Tom and George together.

Well, there are some things that it is too much to expect of a woodcock. After she has played a game of leapfrog for your entertainment, it would be incarnate selfishness to expect her to reply to such a question, and Tom and George left it there. J. D. P.

TO LAKE MEGANTIC.

I LEFT Boston on the evening of Nov. 13 by the Montreal & Boston Air Line, taking a repeating rifle, shotgun, amateur photograph outfit, tent, blankets, etc. After eight hours of sleep, at Newport, Vt., a change was made to the Passumpsic Railway for Sherbrooke, Quebec, which was reached after a run of an hour and a half. Here I was obliged to wait seven hours to connect with the International Railway for Lake Megantic. At Sherbrooke I met with an old friend from Megantic whom I prevailed upon to accompany me in my peregrinations. We took the train at 3 P. M. and after a five hours' ride landed at the lake.

In Sherbrooke occasional patches of snow could be seen, but as we advanced eastward the snow was in greater abundance, and at the lake the ground was covered two or three inches deep. Reaching the village of Agnes on the Chaudiere River which empties the lake, we spent the night there.

Lake Megantic is beautifully situated in the center of a mountainous district, the Megantic Mountains looming up upon its eastern shore, the Little Megantic a short distance from its northern boundary, while the Boundary Mountains encircle in the distance its southern and western shores. The lake is twelve miles in length, crescent-shaped and runs due north and south. It lies on the western slope of the watershed between Canada and the United States, about eight miles from the boundary. Its altitude is over 2,000 feet above the level of the sea, its exact height being 1,200 feet above the city of Montreal. The water in the lake is well stocked with lake trout, or lunge, as they are called there, speckled trout, bass, herring or bellfish and whitefish. Dan Ball, the celebrated Spider Lake guide and trapper, caught a lake trout near the head of the lake last spring weighing 21 pounds. In 1882 my wife caught with a fly at Lake Megantic a speckled trout weighing 3 pounds 13 ounces. This was just at the outlet, and upon another occasion she caught, off Rocky Point, with an artificial minnow (derby trout killer) in two hours, thirteen lake trout, aggregating 54 pounds, the largest one weighing 6½ pounds. Fine sport can be had at the outlet (Chaudiere River) during the month of June fly-fishing, where an occasional land-locked salmon can be hooked.

The steamer Lena (Capt. Jones) was ready to start at 3 P. M., and the captain, wishing to spend the following day with his family at Sandy Bay, placed me at the wheel in command, a circumstance I think he afterward regretted, as I succeeded in running the steamer aground just before reaching the head of the lake, and breaking off one of the blades of the propeller. This accident delayed us some time, so that it was quite late when we landed at Flint's Mills, and made our way to the Three Lakes House, kept by Mr. Wm. Latty. Rush Lake, a very frequent resort for deer during the warm September evenings, is only a mile distant by way of the Lower Spider River. We remained here over night, but before retiring crossed over to Spider Lake (a short carry of half a mile) to the house of our old friend and guide Dan Ball, who, we learned, was out trapping somewhere in the vicinity of the Upper Spider River, but he had left word for our guidance. The next morning we placed our duffle on our hand sled, and having secured the services of a French Canadian we crossed over to Spider Lake, the Geneva of Canada. The lake is about forty feet higher than Lake Megantic, into which it empties after passing through Rush Lake. It is nearly four miles long, its breadth varying from half a mile in some places to three miles. It is in shape like a spider with outspred legs, each leg being represented by a bay. On account of its many bays it is said to have more miles of shore than its neighbor, Lake Megantic, which has fully thirty miles. The proper name of the lake, and as such it is marked on many maps, is Macauamac, an Indian name signifying father, or head of waters, it being the first body of water in this chain on the Canadian boundary. The lake and river is only four miles distant from the head waters (across the boundary) of the Dead River region, which is now becoming a great resort for sportsmen.

We found the lake icebound, the ice having taken a week previous, and it was now, we ascertained, about two inches thick in close proximity to the shore. It was a beautiful cold, clear morning, the ice as smooth as a mirror, and the tramp across it to my summer house, about three miles distant, was a most enjoyable one. We remained in our comfortable quarters till morning, and at half-past seven we selected from our baggage only what we could not get along without, and shouldering our packs started for the upper Spider River, which empties into the lake half a mile further up. We had expected to meet our guide at Young's Camp, an old lumber shanty two miles up the river, but we were disappointed upon reaching it, as the camp had a deserted appearance. Ball's next camp was seven or eight miles further on, in the direction of Moose River, but being in the best of spirits we shouldered our packs, and with a light step struck out for the tramp, having previously stuck a note up on the camp door stating the direction we had taken in case we missed our way. Neither my friend or I had been in that locality before. There was about two inches of snow on the ground, so we could track our guide tolerably well, besides the trail was blazed through part of the way. As long as the tracks were visible we had no fear; but as we advanced the snow disappeared, and to add to our troubles the trail began to divide. At each division we barked a tree and wrote the direction upon it we had taken, keeping always to the right. In this manner we kept on, shooting an occasional partridge, and now and then coming on to a fresh deer or moose track. At noon we made a short halt, built a fire, boiled some tea and fried a couple of partridges, then proceeded on our way. We kept on following the spots on the trees till we thought we must have walked fifteen miles, and still no sign of our guide or his camp. We fired on occasional shot in the hope of hearing an answer, but in this we were disappointed.

The shades of evening began to gather, and we were still in blissful ignorance of our whereabouts. Finally at quarter to five, to cap the climax, rain began to fall and the trail came to an abrupt end. We had no other alternative but to camp for the night. Fortunately we had taken an axe with us, but as we had expected to reach Ball's Camp, had left the tent behind us. While Jack was looking up a suitable spot for a camp I ran up a neighboring hill and climbed a tree to see if I could ascertain where we were. Although nearly dark I could discern about a mile distant a track of burnt land familiar to me. I knew then we could not be over six miles from Young's Camp, which forcibly reminded me how long the miles are when you are traveling in the woods with a pack. I descended and returned to Jack, who had in the meantime cut some poles for a "lean-to." We tied a rubber blanket to them for a roof, laid some balsam boughs against the side to break the rain, and having built a fire in front proceeded to cook our supper. After supper we cut more boughs and made a comfortable bed and prepared to turn in. In the meantime the weather had turned colder, the rain changed to sleet and finally snow. This was what we had been ardently wishing for, as it would enable us to stalk the deer noiselessly and track them. After replenishing the fire with hard wood we wrapped ourselves in our blankets and were soon asleep.

We awoke at daybreak to find the ground covered with two inches of snow. We decided after breakfast if we could pick up the trail again to push on and find Ball. We discovered that our trail had ended in a concession line running between two townships, and after following it up a few rods we found a fresh blaze branching off. We got our packs on and followed it up. We had gone about a mile when we were surprised to meet a man, who turned out to be a companion of our guide. From him we learned we were a mile distant from Ball's camp, and that our guide had started for Young's camp early that morning by another route for the purpose of meeting me, and his confrère was destined for the same place. We had no other alternative but to right about face and accompany him, and we quietly retraced our steps all the day long, diversifying the tramp by shooting some of the grouse, which were very plentiful. We reached Young's camp, from which we had started the day before, at four o'clock, our guide having arrived an hour before us. We were all thoroughly tired, and after discussing the probabilities of a snowfall to facilitate still-hunting, and laying our plans for the morrow, we turned in. What was our delight next morning to find four inches of snow on the ground and snow still falling. Eager for the sport, we took a hasty breakfast; and, rifles in hand, started out in quest of deer tracks. As deer were so plentiful I knew we would not have to go far, and before a quarter of a mile was covered we came upon a fresh track. Jack decided to follow it up and the guide and I went along further. In less than half an hour we came upon a track that approached the trail and doubled back. It was a large track, and in the hopes that it might be a buck I started after it. The direction led me directly eastward up a steep mountain toward the boundary line. I followed along cautiously, but from the uniform steps and great distance apart of the tracks I soon determined that it was a "traveling buck," and I knew I could walk along at my leisure until the tracks would run into those of more deer. I traveled on rather briskly for about two hours, and as I was continually going up hill, concluded I had gone about as many miles, when I saw the track was intersected by that of two more deer, which I took to be a doe and fawn. I now thought it time to commence stalking, and proceeded very cautiously, peeping in all directions. The tracks ran toward every point of the compass after intersecting, which served to give me a lead occasionally. In this manner I crept along till I reached the summit of the mountain and the international boundary. As the snow was still falling I could notice the tracks growing fresher and fresher, and occasionally would come upon a spot where the buck had stopped and pawed the ground and browsed by the way. I had hardly begun the descent of the mountain when I came to the top of a steep incline, and from my position could see quite a distance around me. There was an open hard-wood glade at the bottom of the slope, and standing there, not eighty yards from me, was the deer, a fine buck, with a fawn and doe close by its side. The buck was looking up at me when I sighted him, and for a moment I stood spellbound, admiring the pretty group. It never entered my mind to fire until I was awakened from my reverie by the buck giving an impatient stamp with one of his forward feet. I immediately raised my rifle and fired, aiming down upon the back of the buck, between the fore shoulders. The smoke hardly cleared away in time to let me see that buck disappear upon the bound. Laying the blame upon the rifle (as is always the case when game is missed) I began to descend carefully to get a shot at the doe which had quietly stepped one side behind a treetop and I knew would not move far away from the buck; the fawn had disappeared. I had not descended half way down before I found that I had wounded the buck and turned my attention in his direction, very foolishly letting the doe escape, for had I let the buck alone there I could have shot both. I came to the spot where the buck stood when I fired and saw the snow stained crimson. I followed the red stains over 200 yards and came upon the buck lying down. He raised his head at my approach, and fearing that he might jump up and run again I gave him another shot in the neck. This settled him. The report had also started the doe, which bounded out of sight before I could get a shot at her. I found that the ball had struck him just back of the left shoulder blade on top, had gone through the lungs, pierced the diaphragm and traversed clear through the liver and paunch, making its exit low down in the flank. Notwithstanding this dreadful wound from .45-70-350 cartridge, the deer had bounded out of sight as if unharmed and ran nearly 300 yards. I removed the sling from my rifle and fastening it around the base of his antlers started to tow him around the mountain side down to the trail. I was so elated at my success that I felt as though I could have towed a moose, but my ardor cooled before I reached the trail. As I found I was three miles from camp and it was 3 P. M. I decided to leave the deer till morning for the guide; and cutting off one of the forefeet as a trophy, I started for the camp, which I reached just at dark.

Next morning Jack and the guide started out again, but I was satisfied with deer stalking, so took a frying-pan, piece of bread, lump of butter, some tea, salt and pepper, and started to make my breakfast off the deer. I took my shotgun along with me for partridge, which I had passed by the dozen the day before, while following the deer. Arriving at the spot I had left him the night before I dragged him under the shelter of a friendly hemlock, built a fire, boiled some tea, and skinning down a fore shoulder cut out some steaks and fried them in butter. I drew the deer up to the fire for a seat; and sitting on three-quarters of a deer ate the fourth. Cutting off as much as I could carry I wended my way campward, shooting partridges on the way, which was good sport, as I could find them easily by their tracks on the snow. The rest of the party came in about 4 o'clock, with no deer but a goodly lot of partridges. The snow having frozen and not being deep enough to muffle the footsteps, it was impossible to get near the deer on account of the noise made in traveling. The next day we spent shooting grouse, with splendid luck; and the next morning started down the river with our plunder for my summer house. I found here an old cast away trunk into which I packed the saddle and hindquarter of the deer, the antlers, and forty partridges to take home with me, and after spending another day in taking some winter scenes of surrounding places, I started for Boston, which I reached on the morning of Nov. 27, well pleased with my trip, feeling like a new man and having a splendid appetite (besides some nice accompaniments) for Thanksgiving dinner. H. B.

BOSTON, MASS.

PANTHERS AND DEER.

Editor Forest and Stream:

I notice in last week's issue that you have taken up the right trail—at least to suit my views; and I would not be found alone in this respect if the veteran hunters and trappers could be induced to tell their views. It has been a mystery to us why you have not struck the trail of the panther and of the wolf as well in your efforts to protect deer in the Adirondacks. Perhaps you thought them so few that they were not worth the powder; but in sections where there is very little noise there are plenty of these cowards left to destroy the deer, which also seek the most secluded sections of the wilderness and there meet their fate by their natural enemies, the panther and wolf. Here is an instance, for illustration: We were in a new hunting shanty built two weeks previously in a section of country well stocked with deer at the time, not far from Plumadore Pond, in Franklin county, N. Y., about six miles north of the old Hatch place and about eight miles as the bee flies from the old Danforth place in Duane. We arrived two hours before dark, and one of us must prepare wood and get things fixed for night. There was about two inches of fresh snow that had fallen that day, and we were anxious to get meat and to satisfy ourselves as to future prospects. I cut wood and fixed up for the night, while John Danforth, my companion, was away at once. On his return after dark I asked him whether he had had any shots. Wiping off the snow and removing the cartridge from his rifle and laying it on wedges driven in the shanty logs and brushing the snow and water from his clothes in utter silence and commenced to warm and dry his hands by the camp-fire burning briskly, he broke out: "As far as I went the show is mighty poor for deer. Didn't see a track of a single deer. But I heard ravens and went to where they were at work and found one, or what was left—the head and neck, and the bones; that's all. Killed by a cat. Been killed four or five days. Guess they have killed and driven the deer all out of these parts. Maybe we can get a snap at some of 'em. Wish we had brought over the pup. He is the boy to make 'em climb. They have spoiled our trip this time. If we only had the pup we could get even with them, for their scalps bring $35—State $20, county $10, and town $5; and we are pretty sure to hit a trail of the sneaking cowards on this snow to-morrow. They will hunt to-night, as they lay still in a stormy time you know. They are at it by this time. I would like to get a snap at another one up on the Pimele. You remember that scrape? Of course you do; and if we find a trail bound that way, unless he skulks into the broken down ledge, we'll find him on the hogsback up top, maybe, lying for a deer in the same old place. I'd give my rifle, almost, for another chance like that. How are the partridges; done yet?"

The partridges had been killed clean, by shooting off their heads; skinned, split open on the breast and the breast bone taken out, and stretched out before the wood fire, each on a crotch (with the butt end stuck in the ground), peppered, salted and basted with pork gravy, and by this time were done brown. This is the sweetest and quickest way to cook them.

After the meal Bill filled his old brier pipe, threw himself back on the new bed of hemlock boughs and exclaimed: "This is comfort. No chores to do, and everything serene. Good tracking snow; but where is the game to be found? I believe the cats have finished the deer; but there may be a few left down Beaver Meadow Brook. The panthers kill a deer every time they get hungry, and often when they are not hungry, just for the devilment of it. They cut into the belly and haul out the vitals and heart, sometimes only eating the heart, and then cover the carcass all up with anything they can get, as leaves, moss and sticks. Now what do they do that for? They never come back to eat anything after it gets cold, but keep sneaking about for more. Did you ever see where the panthers have ever made more than four jumps where they have caught deer?" "No, I never did." "What do you think they cover them up for?" "I don't know, Bill. I know they prefer warm meat. I have tried to trap them often at a deer of their killing, but I never caught one at it but once. That was when the trap was set for a fisher, on an old root, twelve feet away from the carcass, and he simply walked up the old moss-covered log to look things over, I suppose, and tried to steal the No. 6 Newhouse spiked trap with one of his fore paws, and it proved smartest in the end. He might not have been the one that killed the deer; so it is very safe to say they never go back to feed on a cold carcass." "No," was the reply, "and I think the full-grown ones average nearly a deer a day the whole year round."

That night Bill went to sleep muttering away to Jack, his dog. He used to talk to this dog when alone as though it were a person, and when jeered about it he would reply, "Jack understands every word I say jus' as well as you do;" and so I have thought sometimes. A dog's days end some time. Bill visited this same section one year later with the pup, and stopped at Bason Spring on the Plumadore trail to get a drink; some villain had left a dose of strychnine there. Jack picked it up and died in Bill's arms before he reached assistance. Last week's issue of your paper notified me of Danforth's own death by the same old method that has sent many others to untimely graves—carrying the hammers of guns on the caps. At least nine-tenths of the fatal accidents by shooting are traced to this cause. All who use guns with hammers should see that they cannot be pushed off at half cock, and should be sure to carry them there; then, if accidentally the hammers are raised, they will catch somewhere and will not fall on the cap unless the trigger is pressed back. I knew Wm. Danforth from boyhood. He became a keen hunter and trapper, and a splendid off-hand rifle shot before the war, in which he served and was wounded. None understood better the tricks and ways of the panther, wolf, bear and deer. He was a man of few words, except in camp or when talking about war or about sporting matters.

He met his death by the same means as Avery, of Canton, and young Bigford, of Thomasville, and several others in this vicinity. J.

GLENS FALLS, N. Y.

Editor Forest and Stream:

I see by various papers that "the woods are full of panthers." I spent two weeks at the head of Cranberry Lake in August, where I saw various parties from other sections of the northwest part of the woods, but heard no

"panther stories." In my opinion very few of these animals exist in the northwestern part of the Adirondack woods at least. A panther travels a great many miles and does a lot of mischief, but a hunter hates him as 'tis said another does "holy water," and would hunt him to death even if there was no bounty at all. Too high a bounty tempts trappers to try to get paid for other game. Many an old skull has been brought out of the woods so much decayed that no one could tell what it was, yet the trapper was ready to swear to its being a wolf or cat. Let the State give a bounty of ten dollars for every hound caught in pursuit of deer, and ten more for their master on second offense, and deer will thrive in spite of panthers. I did not hear of any hounding at the lake, though my guide said he could get one that way if I wanted. So I take it that they do violate the law now and then. R.

CANTON, N. Y., Oct. 29.

SOUTHWESTERN KANSAS.

A YEAR ago the plains south of the Arkansas River were almost a wilderness. Now they are presenting almost the appearance of an old farming country. Nearly all the public lands have been taken up and hundreds of farm houses dot the prairies, while teams hauling lumber, others breaking sod, well borers at work and surveyors finding corners, can be seen daily. Thousands of settlers have located there in the past six months. Other thousands will come in the springtime. It is wonderful, this immigration. "What part of the States are you from?" is the first salutation one meets here.

Game of various kinds, though gradually diminishing, is still to be found in fair numbers. In Stanton county, where I have land, many antelope are yet found. I spent over a month there this fall, in company with an old deer hunter, and though we tried faithfully, we failed to secure a single antelope. The reason was that our guns would not reach them at four and five hundred yards, the usual shooting range here. Our guns are all right in the woods, but here they were inadequate. We learned some points about the game, however, that will doubtless be of benefit to us next time. We discovered that they have regular crossings from one swale to another, and that each herd has its favorite feeding grounds, to which it usually returns the next day, after being driven away. In this they closely resemble deer. But, unlike the deer, the antelope appears to depend more upon its eyesight than powers of scent for safety. Its powers of vision are much keener than those of the deer.

There is other game on these prairies besides antelope. Signs of buffalo were discovered that had evidently been made last spring. But we saw none of the animals. Jack rabbits are sparingly scattered about. They make excellent stews. Prairie dog towns are often seen. These little animals make as good a fry or broil as the fox squirrel.

A few droves of wild horses may still be found along the western border, south of the Arkansas. Numbers of them were captured this summer and fall and sold at different towns along the Santa Fe. Prices ranged from $25 to $35 each. Gray wolves have disappeared from the prairies out here, but the coyotes still carry on their cowardly depredations. Skunks, swifts and badgers abound, having the prairies honeycombed with their dens. A mountain lion is said to be making his headquarters on the Cimarron, having strayed away from his mountain fastnesses. Occasionally a steer or colt falls a victim to his hunger, but as yet no accounts of his attacking human beings have been circulated.

RAMBLER.

JOHNSON COUNTY, Kansas.

DUCK SLAUGHTER AT ENGLISH LAKE.

THE old hunters at English Lake, Ind., were men who for twenty years, every fall from the first of September to the freeze up, were sure to get from half a dozen to a dozen ducks a day, sometimes more. These were shot on the river and in the bayous. In those days a man was considered no sportsman who would wade out in the marsh for ducks. Such a thing as shooting on roosting grounds after dark was unheard of. This was in the old days.

Three years ago there was plenty of shooting on these grounds.

Then a shooting club of Chicago, in order to show their friends, and all whom it might concern, what great duck shots they were, and in order to accomplish what they considered a good bag, surrounded and entered the marsh on every Sunday from the first to the last of the shooting season.

All the ducks were routed, so that by the middle of the season few ducks stayed in the marshes during the day, but they still came here in the evening to roost. But this privilege was not left them, for last fall the marshes were filled with shooters until 8 and 9 o'clock at night. Not one in five of the ducks killed were retrieved.

The manners and management of this club have been the most unsportsmanlike of any known to me. Of the finest shooting grounds in the State they have made a waste in so short a time. Last Sunday (Oct. 4) at about 4 o'clock, a skirmish line of these Chicago shooters, five or six boats abreast, was formed at the head of the lake to destroy as they came down the few coots that had been overlooked. So long as they could average five ducks a day each they had not cared for the coots. Dozens of coots were killed and left to lie on the water where they fell, destroyed for no other reason than that each sportsman might show the others how good a shot he was. After dark the men living about gathered up what birds they wanted and cooked and ate them.

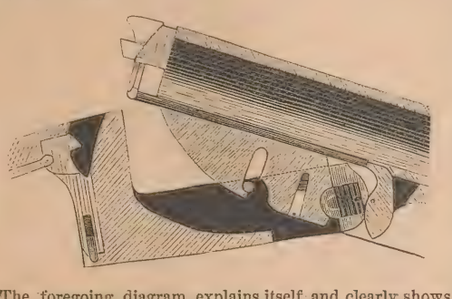
We could not help thinking, would it not have been better for the game and the poor men who went out in the night to gather this game unseen, had they taken repeating rifles, formed a skirmish line, under the law of self-protection, and told these first day shooters to stop killing these coots from pure wantonness, or their boats would be filled so full of bullet holes that their owners woulk sink in the Kankakee mud too deep for their friends to find them.

Not content with destroying all the game in that section they put up signs, warning off trespassers from all the ground they own and all they expect to own.

When any State is invaded by such a party of men, the Legislature ought to appoint a man to protect them from each other. DAN JOHNSTON.

MISSOURI GAME.—Glassville, Mo., Oct. 20.—Weather cold and wet, with heavy frosts. Ducks in considerable numbers are passing south. Some are being killed here, mostly teal. The close season on quail expired Oct. 15, but, though abundant, few have been bagged. Am going out on Grand River soon for a duck and goose hunt, and will report.—C.

THE CHOICE OF GUNS.—VIII.



BY some means I fell into an error in describing the Lefever gun—a gun which I constantly use, and with which I am certainly familiar. The description of this gun was hurriedly written, and in the pressure of professional engagements I mailed the article without having time to read the portion of it descriptive of the Lefever. I avail myself of the first opportunity to correct the error.

In the issue of FOREST AND STREAM of Oct. 1 (Article VI.) the following language is used:

"The hinge-joint [of the Lefever] consists of a ball and socket—the strongest joint known to mechanics. The ball screws into the head of the frame so as to make a perfect compensator, and, as with the bolt, all wear can be taken up by simply turning a screw. The socket is in the lug (the gun has only one lug), and the pressure of the ball into this socket keeps the gun tight. This lug is split, and the lateral wear of the lug may be taken up by turning in a long, tapering screw with which the lug is provided. The fore-end is also made compensating, and if wear occurs there, the turning in of a screw takes it up. The gun has the Nichols hinge-check—the best made—and when it is thrown open an extension or shoulder on the rear of the lug engages with the check and prevents strain."

The error consists in the description of the lug and of the arrangement of the hinge-check, and is due to the looseness of the language used. The gun has, strictly speaking, but one lug. In the forward end of the lug is the socket, into which the ball (screwed into the head of the frame) fits. The lug is partially severed (leaving, however, enough metal connecting the forward and rear sections to insure indestructibility) to receive the hinge-check. The forward section of the lug, which goes through the frame, is split and is provided with a long, tapering screw to take up the lateral wear. The forward end of the rear section of the lug is provided with a hook (or shoulder) which engages with the check and prevents all strain in opening the gun.

In order to avoid all unnecessary expense to FOREST AND STREAM in the presentation of these articles I have endeavored to make myself clear without the use of diagrams—a thing, by the way, difficult to accomplish in describing mechanical contrivances. But to clear up the confusion which the article referred to produces I, for this once, depart from my rule and give below a diagram of the Lefever lug and adjoining parts:

The foregoing diagram explains itself and clearly shows the construction of the lug and its workings.

With the correction of this error I bring these articles to a close. In the course of them some slight typographical mistakes have occurred, marring the graminar but not interfering with the sense of the articles. With these I shall not blame the printer, as it is very likely they were due to the illegibility of my chirography.

In concluding these articles I desire to express my thanks to those who have, by private letter and by their communications to this paper, commented so kindly and so courteously on what I have written.

In the future I shall, when the duties of a busy life permit, give to the readers of this paper some of my notions about shells, powder, shot and wads, loading and cleaning guns, prevention of rust and pits, field shooting, etc.

AH-PE.

SHOOTING IN CUBA.

SINCE last writing you we have made some progress toward regulating the shooting seasons by law here in the Siempre Fiel.

The Spanish law closing the shooting during the seven months between March 1 and Oct. 1 in the public domain, has been extended to Cuba. The law does not affect the right of a landowner to unrestricted shooting over his own grounds at all seasons or his transferring that right to others, except to stipulate that such transfer shall be in writing over his personal signature. This nearly nullifies the protection intended to the game; but any game law here is an advance in that direction. Field sports of various kinds are also gaining in public favor, as the physical necessities of this island are crowding people into forced activity which will gradually acclimate itself. It is but a brief space since baseball as a healthful pastime was scouted as only fitted to other climates; but its tolerance in public opinion has been so growing during the last three or four years that now comparatively few of our youths consider themselves quite happy without being a member of a "basse-ball club." This is a hopeful circumstance that will surely produce good fruit.

A number of well-bred red Irish and Gordon setters and a larger number of English and American pointers have come into the island, and more recently several well-known medical, legal and commercial gentlemen met at the residence of Dr. Wilson, in El Paseo del Prado, and organized the first shooting club, under the designation of Field Sport Club.

This club has rented grounds about a half-hour's rail and ditto of saddle horse from Habana and placed them in charge of its own gamekeeper and police to protect and foster game therein. There are already within these grounds plenty of snipe and some quail, also three large lagoons which are favorite resorts of woodducks during the winter months. The club is now seeking to secure a large tract of quail grounds to place under contract for a term of years.

The quail are this fall abundant and promise us a good season's shooting. This kind of field sport is also growing into favor more generally here, and this puny land, that has never yet traveled on its muscle, may yet develop in that direction from hard necessity, because of fortune having withdrawn from it her hitherto bounteous favors. Now intelligence and muscle must develop to take their place in the public and private weal.

A great industrial revolution has taken place here; a great social revolution is sure to follow upon its heels; is in fact already far advanced, and these new developments of which I have spoken are signs of the new growths which are springing out of the new conditions. To me, and I have been familiar with this society during the last twenty years, it is very interesting to observe the various changes that are going on about me; but this subject is not apropos to your columns.

The tide of American travel which sets toward Cuba every winter will be facilitated the coming season by a new steamer to connect this city with Tampa, Florida, after Dec. 1, by tri-weekly trips, and some of these visitors may find congenial spirits in the Field Sport Club, one of whose members is an American citizen.

I see in your columns that "Nessmuk" is paddling his light canoe along the Florida shore. If the northern blasts should still reach him there and drive his canoe so far out of its course that he should find himself on this side of the narrow strait which separates us, he will still find he has not outtraveled his spicy articles so frequently published in FOREST AND STREAM. NEMO.

HABANA, Oct. 25.

BEARS AND BEAR DOGS.

Editor Forest and Stream:

My experience has taught me that hunting bears with dogs in this country is a success. I have two good half-hound dogs now, a cross between Russian terrier and foxhound. They never fail to tree or stop until I come up. "Bruin" is mistaken when he says there is no recognized breed that will follow successfully large game. We have dogs here that will follow a bear for days before they will give up the chase, and after treed will stay at the tree until starved out, which generally takes about four days and nights. No particular number of dogs is used; some use eight or ten, others use less. I like three, but have now only two; and have good success; but in case one gets crippled of course you would still be fixed to continue the fight, therefore three are a good pack. I would not give a snap for more than three; it costs too much to feed a large pack, and I don't see of what use more than three would be except to make a noise, though I must admit that Mr. Bear doesn't like that.

I have not found that white dogs will tree a bear any quicker than black ones. "Bruin" says he proposes to cross the foxhound with bull-terrier. My experience teaches me that it will be a failure. Bull is the poorest blood that I know of to hunt the bear with. He never will make a long chase; it is not his nature. Put him in your front yard and he is all right—he will nab the first tramp that comes along; but he will forget to let go of a bear even if he should come up with one, unless he should breed to the nature of the hound.

If you want a good bear dog, cross either with the Russian terrier, mastiff or Scotch terrier. The bull's grit does not run in that line. The biggest coward I ever saw about a bear was a big bulldog. Four men could not hold him if he smelled a bear—home he would go. Long hot chases won't do for him. I train dogs by putting pup, one only at a time, with well-trained dogs, and I do not allow them to run anything but bear, panther and the like. Should they start in I just get between them and the game, which will prove probably to be a deer, as they are plentiful here, and give him such a whipping as he will remember. The next time he will look out, and will be more inclined to stay with the pack. A good start dog is worth from one to two hundred dollars and hard to get at that. They don't half of them prove good. The bears in this country are of brown or black, and cinnamon or grizzly. The largest of the brown and black will weigh 500 pounds when fat; the grizzly more.

HUMBOLDT.

PETROLIA, Cal.

A SUNDAY DUCKING.—The Portland, Me., *Press* records: "Sunday last a well-known Commercial street merchant, who is also a keen sportsman, went to ride to Cape Elizabeth, taking with him his little son. Arriving at the Ocean House he heard that some very fine teal were disporting themselves on a pond in that vicinity. Our friend is a great deer stalker and he thought he would stalk the teal. He got possession of an old leaky boat, and, with his boy for oarsman, he started for the birds. A couple of lucky shots brought down three of the birds, and another shot killed one teal and wounded the other. The boy attempted to capture the wounded fowl by striking it over the head with the paddle. The effort was successful, but the same blow that ended the bird's life knocked a hole in the boat and she sank rapidly. Father and son managed to save their game and get to shoal water but were drenched to the skin in so doing and had to ride to town in wet garments in the face of the damp afternoon wind. Yesterday father and son were sitting with feet in hot mustard water to their knees, swallowing hot drops, Loring's specific, and quinine, while the family physician carefully felt their pulses, and the head of the family is not certain but that it would have been cheaper to have kept the Sabbath and bought the birds."

NEW ENGLAND.—Hartford, Oct. 31.—Owing to the destructive snare, small bags of grouse are made in this section. Thousands of snared grouse are marketed in this city, and after being kept a few days are shipped to New York, contrary to law. Quail wintered well, but owing to some cause very few birds are found, and they are too small for shooting. Woodcock are coming slowly. I had some fine shooting on woodcock in Vermont this season, killing the first woodcock in Caledonia county. The people there did not know what these birds were. I bagged seven one morning over my trick pointer Fritz. I notice in a recent issue of your paper you speak as if no birds were shipped from Maine. I will venture to say that there are as many grouse shipped to Boston as before the non-export law went into effect. The mode of shipping is this: A layer of poultry is placed on the bottom of the box or barrel and filled with grouse to very near the top and poultry on top; thus you see the whole package has the appearance of poultry. Many towns away from the railroad have one or two stores who buy grouse, and they are shipped in this manner.—FLICK FLICK.

GALVESTON, Tex., Oct. 22.—Water shooting has been unusually poor down here. But now the ducks are arriving in great quantities. The varieties are mallards, canvasbacks, spritgal, bluewing and greenwing teal, etc. There also have been numerous flocks of brant and geese passing over the city. Yesterday Galveston Bay, over near Pelican Island, was teeming with ducks, and in a day or so there will be good shooting on the island. Many of the snipe and plover have left for more southern regions.—REDBREAST.

THE TUXEDO CLUB.—Of this new club Mr. John G. Heckscher told a *Sun* reporter: "Some time ago Mr. Lorillard conceived the idea of forming a club for sportsmen on his beautiful estate in Orange county. He owns there a tract of 5,000 acres of lakes and mountain land. He calls it Tuxedo Park, and it is situated one mile from Lorillard station on the Erie Railroad, among the mountains of Orange and Rockland counties. He spoke to a number of friends who jumped at the idea of having a club where they could enjoy good shooting and fishing so accessible to the city. The upshot has been that the club was at once organized. The President is Mr. Pierre Lorillard; Vice-President, Mr. Allen T. Rice; Treasurer, Mr. Herbert C. Pell, and the Secretary, Mr. W. Kent. The club will consist of 200 non-resident members, in addition to such members as may own houses in Tuxedo Park. It is organized to furnish facilities for fishing, shooting, boating, skating, tobogganing and ice boating, and to serve as a general resort both summer and winter for the use of members and their families. It will be kept open throughout the year. The park proposes to build a club house, with sleeping accommodations for about 100 members. The park will lease the shooting and fishing of the estate to the club for a period of twenty-one years, stock the lakes, streams and preserves, and give them to the control of the club during said term for the sum of $100 initiation fee for each member and his annual dues of $100; also supply game keepers and fish wardens, keep grounds in order, and pay for the period of five years any shortage there may be in running expenses to the extent of $20,000 per annum. Mr. Lorillard guarantees the project, and the plan will be a grand success. Already a great many applications for membership have been made."

THE RED FOX AS A TREE CLIMBER.—One of your correspondents seems to think that the red fox never does climb a tree. I do not speak from heresay, but from my own experience, where holes are plenty and where bluffs along the river course afford ample opportunity for reynard to dodge into a hole. In my boyhood in this neighborhood the most successful fox hunter would bag as many as three reds a day, never shot them, but their packs of thirty or forty hounds would turn up reynard's toes in a race of from twelve to sixteen miles run. One instance I distinctly remember. A red fox, started three miles from town, made a course for the river, and in half a mile from the town, being hard pressed, took to an open field. In the center of a ten acre lot was a black walnut tree thirty or forty feet high, and perpendicular as a tree ever grew, and twenty feet to a limb. The red fox concluded it was safest for him to climb up this very particular tree. He did so, and there remained until we all surrounded the tree. Hunters and dogs gave him as another chance for his life a half hour start, but the hounds were too fast for him; they overtook him in less than thirty minutes. Many other instances of climbing by the red fox I could cite, and would be verified by numberless ones in this vicinity.—AH LOOK.

THE RIFLE OF THE FUTURE.—I would like to offer a comment or two upon the "Addendum to 'Woodcraft'," in your paper of Oct. 1. I have used double rifles similar to those advocated by "Nessmuk," for several seasons, and were I to select a gun to-day, I would ask no better for all-around work. One may use a light or heavy bullet, and vary the charge of powder to suit himself. The point made concerning the advantage of the lock underneath, had never occurred to me, though it seems well taken. I have used single rifles with such locks, but never liked the look of them, and always preferred side locks. If this is to be the rifle of the future, for hunting, I give it as my opinion that it will be made so as to load at the muzzle for accuracy, at the breech for convenience. I agree with "Nessmuk" that rapidity of loading is of much less importance than many suppose, but the sportsman of the future will insist upon his privilege of looking through the barrel of his gun at short notice. With a combination rifle and shotgun of this sort, and with an auxiliary barrel to be used in the smooth-bore if desired, it would seem that one might safely "take to the timber."—KELPIE.

THE POLYONOMOUS GAME BIRD.—*Editor Forest and Stream:* I have always called a quail quail, and my worst enemy wouldn't call me "dudey." I do not object to the term partridge for those who like it. Either sounds to me better than Bob White. There is a good deal in being used to things. A man may talk about his fishpole or his musket, where I would say rod or gun, and he may after all be one with whom I would be willing to camp out; and that is saying a great deal. I cannot believe that Northern sportsmen will ever call their quail partridge, for the most of them would think that a ruffed grouse was meant. Neither do I think that our Southern friends will call their partridge quail, in our time at least. I see no occasion for heat in this discussion. I had no difficulty in fraternizing with the partridge men when I was among them. "Let us have peace."—KELPIE.

MASSACHUSETTS.—Salem, Mass., Nov. 2.—The quail, though reported plenty before the season opened, have not been found so numerous since, though some good bags have been made. Reading parties have done well, so have some from Salem, including, among others, the old veteran Ben Grover, who at 75 years of age recently remarked to me about his setter: "Oh, he is a good dog or will be, but he is young yet, only eighteen months old." Love of sports afield keeps this old fellow young. I'd like to see some of the shooting he has had in years gone by. He shoots and tramps well now, and I doubt not these brief lines will catch the eye of some one else who remembers him too. Partridges are rather plenty, but very shy. Woodcock have been rather scarce. Snipe have been not over plenty.—X. Y. Z.

MISTAKEN FOR A BEAR.—Frankfort, Mich, Oct. 26.—Last Friday Sherwood Hall, of Grand Rapids, and a hunter named Crouse were hunting ducks on Platte Lake. Crouse went on shore, Hall remaining in the boat to look for deer or bear near a salt lick. Seeing what he supposed to be a bear he fired and then ran up to it, when he found that he had shot a woman who was in the marsh gathering cranberries. Crouse called Hall and they carried her to Griff's, the nearest house. The accident happened at 5 P. M., and the lady died the next morning at 4.

TORONTO, Oct. 28.—Duck shooting about the islands poor, local sportsmen returning from the Flats with good scores. Some good woodcock shooting has been done, birds lying well to dogs. Plover almost gone.—DREAD SHOT.

A VERY ANCIENT DEVICE.—The South Bend. (Ind.) *Tribune* says: Sportsmen will be interested in a novel boat which Mr. Lew Casaday, of this city, has invented and had patented. It is designed for duck shooting, and a test made with it one day this week by Mr. Casaday proves its efficiency. He shot and secured forty-seven ducks, and thinks he killed about a hundred in all. To make an invisible boat Mr. Casaday takes a common boat and cuts from the bow back say one-third of the entire boat's length down to the water line. This is made water-tight, and at its opposite end from the bow a mirror (in this case 28 inches high and 48 inches long) is placed so that the glass reflects the water in front and the decoys. Behind the mirror the hunter sits and paddles his boat toward the ducks and makes his observations through a small spot in the mirror from which the amalgam has been removed. As the boat moves up to the ducks they can see their own reflections in the mirror, and in some instances swim toward the boat. When the hunter is near enough to shoot he drops the mirror forward by loosening a string and gets two effective shots—one at the ducks on the water and one as they rise. Mr. Casaday's patent includes the use of mirrors and also a boat whose sides are entirely covered with mirrors.

CLINTON, Mass., Oct. 29.—The two sides of the Clinton Sportsmen's Club have been out for their annual hunt. Elwood's side reported 11,695 points, Bower's 5,565, and they paid for the supper for the 70 hunters and guests. The game secured was rated as follows: Coons and foxes 100 points each, wild geese 75, minks 50, white rabbits 35, gray rabbits, wild ducks, gray squirrels, woodcock, partridges, 25 each; muskrats, crows, wild pigeons, hawks, owls, 15 each; woodchucks 10, red squirrels, bluejays, 5 each. Many went in pairs or quartetts. The best individual scores were: C. H. Laselle 1,995 points, G. W. Goss 1,025, G. M. Livermoor 840, F. E. Carr 540, D. H. Hayter 510, Dr. W. P. Bower 405, while Hartshorn and Truell aggregated 3,335 points.

CAUSE OF ACCIDENTS.—In your issue of Oct. 15 Mr. Waldurf says "the bullet passed into the chamber, but the end of the shell caught on the upper side of the chamber and would not enter," etc., etc. He acknowledges that the shell was improperly loaded; this of course was where the fault lay. I have an opinion that the immediate cause of the accident was the clogging by dirt or otherwise of the automatic safety device in the rear of the trigger, which allowed the hand to unfasten the trigger while in the act of closing the breech, such an accidental movement might easily be made while the attention was directed away from the gun.—W. S.

PENNSYLVANIA QUAIL.—The few sportsmen of this city who have taken advantage of the early quail shooting date of Pennsylvania have returned with bad showings, and report the foliage yet too dense and the birds not inclined to feed in the open places, but tell us the coveys are more plentiful everywhere than last year, basing their judgment from sayings of the country people. We will hear of good shooting by the middle of November, as compared with last season.—HOMO.

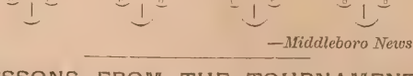
THE TALE OF A FISH.

When a man doth wish to angle,
A hook like this he loves to dangle:

J



He has a line so good and strong,
And catches a fish about so long:

Before he gets home the fish doth grow (?)
And he tells his friends that it stretched out so:

But his friends who have a fishing been
Know that the man has lied like sin,
And they simply sit and smile and grin.

—*Middleboro News.*

LESSONS FROM THE TOURNAMENT.

WE present on another page some sketches of the contestants in the late fly-casting tournament, which cannot fail to be instructive to those who did not witness the contests, and especially to novices in the art, for whom alone these lessons are valuable. The illustrations are all taken from the expert class in single-handed fly-casting by means of instantaneous photographs by one of the FOREST AND STREAM staff. They show what it is well to avoid as well as to copy, and range from bad style to the more correct form. The camera often catches what the eye does not, and therefore these pictures, chosen from a great number, show faults that many an angler would not detect unless they were repeated, and, in consequence, emphasized. The contestants themselves are usually unaware of any peculiar action, fault of position, or error in the handling of the rod, because they do not see the movement of either rod or line when behind them.

No. 1.—This position was the worst that the camera seized upon. The man is balancing himself with both left hand and right foot against the strain that he is putting upon his rod in order to get out line in this contest, where distance alone counts. He is taken at the moment of pause between the recovery and the cast. The rod is carried too far back and his line is in the water behind him, a common fault with this man, who is not an angler but a workman in a rod factory, perhaps a rod tester, who has been trained to cast as a matter of business. He has never before cast in a tournament, and under the rule of the first one would have been entitled to enter the amateur class, but from which he has wisely been barred by the revised rules. He made a record of a wonderful cast of over eighty feet, as did every man in this class who is barred from the amateur class by reason of business. His style is exceedingly bad and is shown that it may be avoided.

No. 2.—This man's position is not as bad as that of No. 1, still he shows by the uplifting of the left arm and the consequent contraction of the muscles that he is under a muscular strain and that his training has been deficient in some points. His line often dragged in the water behind, yet he cast beyond the 80-foot buoy, the longest and not the average cast being recorded. Never in his life did he cast a fly for a trout and, as his tastes do not run that way, he probably never will. As a professional caster we would call his attention to the fact that his grip on the rod is too high, whereby he loses just so much on the length of his rod, and this may have cost him several feet on his score. He can get out a length of line that an amateur might envy, but his style of doing it is not to be imitated, while his "delicacy" is not to be taken into account. He is a good workman in the factory, a good judge of a rod, and a good caster for distance. He has been trained as an athlete to do certain work and he does it, but there are as many trout now in the streams as if he had never lived.

No. 3.—In this case the position of the man is better than that of the two foregoing, showing more ease and grace. The rod is too far back and catching the water behind was one of the greatest faults of the contestant, and this is not caused by the angle of the rod alone when at its stopping point, but rather by the motion of the wrist and forearm. The person illustrated has fished for trout one or two seasons, but is not much of an angler, having trained in casting to win prizes for the house he works for. This is a perfectly legitimate thing in the expert class, which is gotten up merely to see what can be done by trained experts, and in which, if "the longest pole" does not "knock the persimmons," the longest line scoops in the prize. Although we have shown him with his line cutting the water behind him, and thereby retarding his cast, he scored above the eighty feet, which we still regard as a wonderful cast, although it has been exceeded by twelve feet this year.

No. 4.—This contestant threw his rod slightly far back but compensated for it in a measure by keeping his line well up. In our opinion he raised his hand too high, yet his results were good without sacrifice of either style or grace, or of danger of his line fouling the water behind. This last point is one of the greatest drags in casting for distance, or, in fact, for any sort of fly-casting that the amateur has to encounter. It checks the line at the time when the rod starts from the recovery to send the flies forward and does not lose its grip on the water until both arm and rod have about spent their force, hence the cast is often many feet short of what it would be if the line had been kept in the air. With grass instead of water behind him his flies would have either caught or been torn off many times.

No. 5.—This is the most correct and easy position that we noticed. The man is an angler as well as a fly-caster, and he can cast both with delicacy and accuracy and also far off. As a rule we think his rod did not go as far back as when our artist caught him, and his line seldom touched the water behind. His style is much like that of Reuben Leonard, a picture of whom was spoiled by accident, and his flies were straightened in the air behind on the recovery in very graceful style. The back cast is the most essential thing in casting and marks the correct and graceful angler more than any other point. This grace was more noticeable in the amateur class than in the expert, and we have selected from the latter class more to show what to avoid than what to follow. The recovery of No. 5. was the best of those caught by the photographer, as No. 1 was the worst.

No. 6 shows the switch cast, in which the rod goes far behind while the line does not. The motion is a quick one, no time being allowed when the rod is recovered. It is a style new to this country and was first introduced to the public in 1881, at Coney Island, during a tournament of the New York State Sportsmen's Association, by Harry Prichard, whose cast of 91 feet in the tournament of 1882, with this cast, remained unparalleled until beaten one foot this year by Reuben Leonard with a retrieved line. The cast is one that can only be acquired by long practice and is extremely difficult. It is very useful on occasions when trees in the rear forbid the retrieving of the line, and is one that should be studied by all anglers for emergencies. It is not a handsome cast, as it consists of a series of violent slashings, and at times of some commotion in the water at the foot of the angler, when the line fails to respond to his efforts.

It has been the aim of the Rod and Reel Association to encourage the amateur class, and to this end they have made rigid rules concerning admission into this contest. The expert class is of the "go-as-you-please" order, and is interesting mainly as showing what can be done with a single-handed, 11½-foot rod. To the objection raised by some that men who are not anglers but are trained for this class form a large proportion of the contestants in it, the committee very truly say that it bears the same relation to angling that target-shooting does to deer shooting, and that as men win prizes at the target who never saw a deer, so men who never killed a trout may show what can be done with a rod, and that the practice tends to develop the instruments used and to afford lessons for amateurs. We believe that every angler finds occasion for a long cast at some time when he cannot move near to a rising fish, and that in the long run the one who can by an effort cast seventy feet has an advantage over those who cannot get out over fifty, to say nothing of the pride that one feels in the possession of the skill necessary to do it. We all know that most of our trout are taken inside of forty feet, a distance at which a skillful angler can drop his flies delicately and accurately under ordinary conditions of wind; yet we would not be content with that distance as the limit of reach. The tournaments have done much good in stimulating practice with the rod, and to-day there are many anglers who have taken observations at these contests who have by practice improved their casting in distance, delicacy and accuracy.

THE SLEEP OF FISHES.—An experiment has recently been tried at the Inventions Exhibition Aquarium by Mr. W. August Carter with a view of discovering how far fish are prone to sleep. After a close examination he found that among fresh-water fishes the roach, dace, gudgeon, carp, tench, minnow and catfish sleep periodically in common with terrestrial animals. The same instincts were found to actuate marine fish, of which the following were observed to be equally influenced by somnolence, viz.: the wrasse, conger eel, dory, dogfish, wrasse bass and all species of flat fish. Mr. Carter states that, so far as he can discover, the goldfish, pike and angler fish never sleep, but rest periodically. Desire for sleep among fish varies according to meteorological conditions. Fish do not necessarily select nighttime for repose.

FISHING ABOUT MT. WHITNEY.

IN the southeast corner of California Mt. Whitney looms into the sky. It is the climax and the crown of the Sierras, that in this neighborhood tower in lofty and majestic altitudes, reaching, in Whitney, the highest elevation in the United States. From Yosemite southward for over 100 miles the Sierras lift to an average altitude of 12,000 feet; a noble line of luminous mountains, presenting an universal scene of splendor, here and there glorified by glistening peaks that, wrapped in eternal ice, pierce the lofty heavens.

As seen from the great Owens Lake Valley, which lies just to the east of the Sierras, these mountains present a panorama of scenery unequalled elsewhere on the continent, in their might and mass and grandeur.

The depth of awful cañons, the face of mighty cliffs, the uplift of rugged and unapproachable heights are carved against that western horizon.

Here, though but a parcel of the region we have spoken of, is a world of beauty and interest, full of attractions for the tourist and the sportsman, more particularly the fisherman, though he who aspires to larger game may pursue his desire to the full. The indolent tourist to whom the elegance of the palace car is wearisome has no part in this vigorous place, where lofty summits are to be scaled, deep precipices overlooked and the fierce wilderness penetrated. Here each hour calls for exertion and vigor. Yet to him who dares it and overcomes, as he sits down at last on some lofty seat, soaring in the sky and overlooking the world, what splendid exhilaration of the mind and of all the senses fill up his experience as the mountain winds cool the brow and he bares his head in very presence of the sun.

Looking toward the east, Mt. Whitney peers into the dim reaches of the mighty desert region that culminates in the Great American Desert of the geographers. His eastern face is sheer and swift, lifting in an almost perpendicular wall from the mass of the general range. From the east he is unapproachable. Not so on the west, for here the mountains spread into vast spaces, and as they spread become creations of beauty and interest.

At Whitney's western base are spread out an exquisite area of meadows known as the Monache Meadows—highland valleys set amid the snowy summits, green with grasses and musical with streams. Through them the Kern River slowly creeps, for these valleys, though upon the very apex of the mountains, are as level as a floor.

It is impossible to describe the majestic and lovely frame in which these meadows are set. About them in graceful attitudes and eloquent with power rise into the deep blue heavens the hoary peaks massed and piled in the sky and suggestive of imperishable strength, and there as we look they lead forth in splendid procession into the dim distance, peak rising on peak, gorge linked to gorge, until the distant heavens are crowded with august shapes. But the scene is not all grandeur, for in many a delicious nook grace and beauty find a hiding place, where the deep cool woods lift their shining leaves, delicate flowers paint the earth with exquisite colors, clear waters dash and sing, and the silent pools all day long reflect the bending sky and duplicate the delicate buds that bloom along their rim.

This is the fisherman's paradise, for stream and pool on every hand are filled with all varieties of mountain trout, from the swift brook dweller darting like lightning from riffle to riffle to his lazier brother of the pool and lake.

In the number of streams and lakes within a defined territory, in the numbers of fish inhabiting the waters and in the matter of ease with which they are taken, it is, without doubt, the finest fishing field in America to-day, and so remarkable in every respect that it will well repay even the sportsman of the East to spend a summer here. The brook trout inhabiting the icy streams that rush down the swift mountain slopes do not, as a rule, exceed ten inches in length, but the lake and river trout grow to be of great size and weight in individual instances, though an average string of lake trout would run from one to three pounds each. It needs no especial skill to here land the shining beauties. Protected as this high region is from intrusion except during the summer months, the fish are as yet unsuspecting of man's intent, and though vigorous and active and on the alert, as is their nature, they are not wild. A quiet fisherman without toil can here hook, in the course of a few hours on any day more than he wishes to carry to his camp.

There is found here a peculiar variety of trout, found, as we are advised, at no other point in the world, and they have as yet received neither scientific place nor name. They are called the "golden trout," and have their home in the headwaters of Whitney Creek, a cold, wild stream that heads in the ice fields of Mt. Whitney, and dashes and roars and foams over and across the swift slopes, to be lost at last in Kern River. These beautiful fish are seldom more than eight inches in length, and are of a bright golden color, as purely golden as if they were incased in gold foil. They are exceedingly active, swift and hardy, with a flesh white, hard and juicy and of most exquisite flavor. They are more sought for than the other varieties here on account of their delicate flesh.

They are by a most curious and beautifully ordered provision of nature protected in their original species. As we have said, their home is in the headwaters of Whitney Creek. Just below their home are high, precipitous walls, over which the creek leaps with the might and roar of the fall. These falls form an impassable barrier between the fish above and below—at least prevent the fish below from ascending and mingling with those above. Now and then a golden trout escaping down and over the wall has mingled with the species below, and frequently there is hooked a fish in whom is mixed the qualities and colors of the speckled and golden trout.

For some years past during each summer a number of those who live in the valleys to the east, more especially those in the Owen's Lake valley, have spent a few weeks in this section, and it has a great local fame which is enlarging its circle each year, and we doubt not that from its presence at the base of the highest mountain in the United States it will ere long command as much attention and attract to it as great a number of those to whom mountains are an attraction and the pursuits of the rod and line a delight as Yosemite and the already famed resorts of California.

Until within the year just past the remoteness and inaccessibility of this portion of the State prevented much notice being taken of it, although it had been rumored abroad that there were here great natural wonders and many attractions for the tourist. A two days' and nights' weary ride across a fearful and desolate waste by way of the Mojave Desert closed the gate between the world and these wonders.

This has all passed away, for the Carson and Colorado Railroad, which connects by way of the Virginia and Truckee Railroad with the Central Pacific Railroad at Reno, Nev., extends to Owens Lake, in the Owens Lake Valley, abreast of Mt. Whitney, and just under its shadow. Leaving the Central Pacific Railroad at Reno in the morning, one by way of the Virginia and Truckee and Carson and Colorado Railroads, can on the morning succeeding be landed at the historic village of Lone Pine, which is distant but fifty miles from the summit of Mt. Whitney and is the point where outfits and guides are to be obtained for a trip into the region we have described. Here at fair rates are to be obtained mules, attendants and guides, and all necessary provisions and necessaries for a camp in the mountains. Starting in the early morning, an advance is leisurely made into the mountains a distance of some twenty-five miles. Though this distance is made while the afternoon is still young, it has been the custom for years to here make camp, for wood and water and grass are abundant and the ground just adapted to a pleasant camp.

The wear of the first day's ride usually enables the rider to give his ready assent to an early camp, and when one dismounts and from his high platform looks off across the vast sweep of the mighty eastern deserts below him and the awful ranges of bare and burning desert mountains and turns to the west to catch the rosy light from off the summits of the Sierras, in whose presence he is, and hears the dash of the mountain stream, he leans upon the mountain slope filled with wonder and delight as he is informed by his guide that what he now sees is not even a suggestion of the splendors to be disclosed on the morrow. A second day by steady climb ever upward, upward as if you were to reach the very door of heaven, until in the early afternoon you scale the summit and dive into the wonderful region about Whitney's base, choosing where you may establish your camp, from which day after day, without tire or weariness, you go forth to adventure and sport. Each day is so full of delight, the senses ravished with scenes of such glorious and indescribable grandeur and beauty, the frame nourished by the sweetness of the high, pure airs and the mind freed from care left to drift with the influences of the place, that we scarce take note of time until the waning summer warns us that we must away.

It is impossible to more than hint at and suggest the realities of so great a region, and here is just the quarrel with our powers, for if we could but sketch it as it exists, its mountain slopes and heights and cañons and woods would be crowded with astonished yet delighted thousands, crowding all the avenues of this wild and grand pleasure ground of the West.

We have traveled through all the Pacific States and visited the many noted and really wonderful sceneries to be found there, and we can truly say that at no point have we found one that in itself combines so much of all the elements of interest as found here around the base and foot of Mt. Whitney. GEO. T. MILLS.

CARSON CITY, Nevada.

BLACK BASS FLY-FISHING.

I WAS much interested and pleased with an article by "Percyval," under the above heading, in the FOREST AND STREAM of Oct. 22, and I quite agree with him that it would be well to exchange ideas on the subject. I, for one, would be glad to hear what some of the more skilled and experienced anglers have to say in regard to fly-fishing for bass.

For some time past I have given considerable attention to the manufacture of my own bass flies, and have experimented with them every season for the past ten years on the Bay of Quinte, Ontario. The waters of this beautiful bay are admirably adapted to the propagation of this noble fish, with which it is abundantly supplied, thanks to the vigilant and energetic inspector, Mr. Charles Wilkins. I have angled in the Bay of Quinte every year, say, since 1875, for two or three weeks at a time, and during that period have used bait on three or four occasions only, for the reason that I do not care for bait-fishing when I can get fly-shing, and I have met with such success with the fly that this alone was sufficient to induce me to continue with what I knew from experience to be the most satisfactory method of angling for black bass. At any rate, I would prefer to catch six bass with a fly to two dozen with bait, and what true angler would not? I use my own made flies on all occasions, and may say that I have fished with gentlemen who were acknowledged to be good fishermen, and who used the best bass flies they could obtain, and I do not know of many instances when they were more successful than I was. This may sound like "blowing your own horn," but I assure you I am not saying it with that intention. I wish merely to establish the fact that there seems to be no settled or fixed rule for fly-fishing for bass, so far as the particular color and style of fly is concerned. This may be said, at all events, as regards the Bay of Quinte and Sharbot Lake, where I fished last season.

I make my flies somewhat roughly and according to no pattern. The most killing bass flies that I use are composed of green bodies with yellow wings; red bodies, gold tinsel and brown wings; yellow bodies with black wings; red bodies, silver thread and scarlet and dark brown wings. These flies are tied on No. 6 sproat hooks for casting and on No. 4 hooks for trolling; in the latter case I use also peacock hackle. I have known fishermen laugh when they first saw my flies, and heard them remark, "You surely do not expect to catch anything with those flies. Here, try some of mine; these are from New York," etc., etc. I have replied, "No, thank you; not at present. Until I see that yours take better than mine I prefer to stick to my own." And I have generally managed to make quite as good a haul as my skilled friend with his celebrated New York, Boston or Chicago flies, neatly tied and certainly far better made flies than mine.

Persons desirous of having really good bass fishing would do well to pay a visit to the Bay of Quinte, at almost any time from the end of May to the end of September. They will find good hotel accommodations at Belleville (quarter of a mile from the bay) and can hire capital boats and men at a reasonable figure to take them to the favorite spots for fishing—in fact, the fishing is good almost anywhere in the bay. I have several times secured three bass at a cast. I should think the bass average about one pound in weight. They are frequently caught from three to four pounds, and I believe much larger; but I have not myself caught any that exceeded four pounds.

I hope to see several articles on this subject from more experienced and skilled anglers. WALTER G.

TORONTO, Ont., Oct. 27.

GALVESTON, Tex., Oct. 26.—Fishing has been very good here for some time, as proved by the numerous strings of sheepshead, redfish, trout, etc., which have been brought in. —REDBREAST.

RHODE ISLAND WATERS.—With a friend I left the largest city in the smallest State on a late train for bass. We had been told by another friend who lives within five miles of the pond that one of our fish commissioners had lately taken from this same pond twelve or fifteen bass, weighing about thirty-five pounds. We had unbounded confidence in our friend's veracity at that time, and should have to this day probably had we reached the depot thirty seconds later than we did. But we happened to catch the train, and our confidence in our friend is shaken badly. We set out for the waters before the sun had thought of showing himself. We were not well acquainted with the best places in the pond for bass, and so rowed around trying a number of likely looking spots, but not a bass could be got to notice our baits. After catching less than a bushel of sunfish about as large as a FOREST AND STREAM folded in the center, we decided to try trolling. The sun had risen and everything indicated a pleasant day, when suddenly a heavy, wet-looking cloud formed a little way before the sun, and shortly hid the latter from view. Since that day, whenever either of us see the sun rise clear in the morning and then go under a cloud we always take an umbrella, waterproof coat, and, if convenient, a pump. I doubt if ever since rain was first discovered did more fall in one day than then. Imagine a figure in the stern of the boat, with no protection from the rain other than light summer clothing and an old straw hat, and the drops falling from his nose, ears, whiskers, and in fact everywhere, while from under his shaggy eyebrows two bright eyes beaming with fun and good nature; and two other men, one rowing and the other shivering, and you have the picture as it looked to me that day. It was a cold rain. We threw rather than packed our traps in the wagon and started for the train, caught it and went flying home. How the drummers looked at us and smiled a pitying sort of a smile as we drew ourselves in the car. But they didn't know what a good time we had been having, for they don't sit in a swinging chair all day; and add, subtract and multiply and divide, and write, "My Dear Sir," and "Yours truly" from morning till night.—DRUGS.

MENHADEN.—Roslyn, L. I., Oct. 30.—For several days past Roslyn Harbor has been almost literally packed with menhaden. The fish lie quite near the water's surface, with the upper point of the caudal fin visible above the water. They appear to be logy, or as if chilled, and will scarcely move out of the way of a boat rowing among them. During a twenty years' residence in this place I have never seen such great numbers of these fish in the harbor.—THOS. CLAPHAM.

Fisheulture.

Address all communications to the Forest and Stream Publishing Co.

THE SOLES DIED.—In our last issue we announced that five hundred live soles were expected to arrive from England this week, as a present from the National Fisheulture Association of England, to the U. S. Fish Commission. The Cunard steamer Gallia came to the wharf on Tuesday morning, and we boarded her at once and found Mr. William Little, the agent of the Association, who told us that on the first night out of Queenstown, very rough weather killed all the fish but eighteen, which died within a day or two after. We found the casks on a hurricane deck, near the bridge. They all lay upon the bilge and had square openings at top, with a curb dropping a few inches to prevent splashing. In the bottom of some of the casks was a perforated wooden platform for the fish to lie upon, and in others a perforated iron pipe to which an air pump could be attached. There was no sand for the fish to bury in, and this we think caused the bruised condition of the dead fish shown us. Under proper condition, tanks hung on gimbals and small suspended ones, with plenty of sand to bed in, these fish can be brought over safely. It has already been done in small glass globes, as reported in our columns, by Capt. Mortimer and others, and can be done again. The sole is a fish that may be acclimated on the sandy portions of our coast and is superior to any of our flat fishes.

RUSSIA AWAKES.—The Imperial Russian Society of Acclimatisation, Moscow, has recently elected our correspondent Mr. Hugo Mulertt, of Cincinnati, to be a corresponding member of the Society. This is, as far as we know, the first American fisheulturist who has been thus honored.

THE NEVADA COMMISSION.—Mr. W. M. Cary, of Carson City, Nev., has recently been appointed Commissioner of Fisheries in place of Hon. H. G. Parker.

FIXTURES.

BENCH SHOWS.

Dec. 15, 16, 17 and 18.—First Annual Dog Show of the Western Connecticut Poultry, Pigeon and Pet Stock Association. Frank D. Hallet, Superintendent, Winsted, Conn.

March 16, 17, 18 and 19, 1886.—Western Pennsylvania Poultry Society's Dog Show, at Pittsburgh, Pa. C. B. Elben, Secretary.

April 6, 7, 8 and 9, 1886.—Second Annual Dog Show of the New England Kennel Club. Jean Grosvenor, Secretary, Boston, Mass.

FIELD TRIALS.

Nov. 9.—Second Annual Field Trials of the Fisher's Island Club, for members only. Max Wenzel, Secretary, Hoboken, N. J.

Nov. 9.—First Annual Trials of the Western Field Trials Association, at Abilene, Kan. Entries close Oct. 15. A. A. Whipple, Secretary, Kansas City, Mo.

Nov. 12.—New Jersey Kennel and Field Trials Club. Field trials for members only at Fisher's Island. A. P. Vredenburgh, Secretary, Bergen Point, N. J.

Nov. 16, 1885.—Seventh Annual Field Trials of the Eastern Field Trials Club, High Point, N. C. Entries for All-Aged Stakes close Nov. 1. W. A. Coster, Secretary, Flatbush, L. I.

Nov. 17, 18 and 19.—Second Annual Field Trials of the Philadelphia Kennel Club at Rio Grande, N. J., for members only. Entries close Nov. 1.

Dec. 7.—Seventh Annual Field Trials of the National Field Trials Club, Grand Junction, Tenn. Entries for Derby close April 1. B. M. Stephenson, La Grange, Tenn., Secretary.

A. K. R.—SPECIAL NOTICE.

THE AMERICAN KENNEL REGISTER, for the registration of pedigrees, etc. (with prize lists of all shows and trials), is published every month. Entries close on the 1st. Should be in early. Entry blanks sent on receipt of stamped and addressed envelope. Registration fee (50 cents) must accompany each entry. No entries inserted unless paid in advance. Yearly subscription $1.50. Address "American Kennel Register," P. O. Box 2832, New York. Number of entries already printed **2794.**

PHILADELPHIA KENNEL CLUB.

Editor Forest and Stream:

The following entries have come in since last report:

ALL-AGED.

KNOB (G. Schniber), lemon and white English setter dog (Grouse—Flora).

WRAGG (George Emlen), Gordon setter dog (Toledo Grouse—Maud).

CREOLE (Maj. Wibirt), red Irish bitch (Grafton—Megg).

A pointer bitch, name not yet procured (C. H. Clark, Jr.).

An Irish setter bitch, name not yet procured (I. H. Roberts).

DERBY STAKES.

BUCKINGHAM (George De Haven), lemon belton English setter dog (Dude—Dudene).

FAIRY GLEN (E. W. Jester), blue belton English setter bitch (Glen Rock—Blue Belle).

Mr. E. W. Clark, Jr., has withdrawn Rowdy, as he finds that he will be unable to get him from North Carolina in time.

L. Shuster, Jr., has declined to enter his dogs.

As the accommodations at Rio Grande, N. J., where the field trials will be held Nov. 17, 18 and 19, are limited, especially as to sleeping capacity, it is necessary that those wishing to witness them should notify the chairman of the committee at once. The trials, of course, are open to members' dogs only, and the entries are about evenly divided between the English and red setters. A right sociable time is expected and no growling will be tolerated.

The weather as I close is right "gamy," the best we have had yet for shooting, and the season opens Monday. HOMO.

THE EASTERN FIELD TRIALS.

FOLLOWING is a partial list of the entries in the All-Aged Setter and Pointer Stakes of the Eastern Field Trials Club, to be run at High Point, N. C., commencing Nov. 16. We hope to be able to give the remainder next week:

ENGLISH SETTERS.

PLANTAGENET (C. Fred Crawford, Pawtucket, R. I.), orange and white dog, 5yrs. (Dashing Monarch—Petrel).

NELLIE II. (C. Fred Crawford, Pawtucket, R. I.), black, white and tan bitch, 4yrs. (Count Noble—Rosalind).

GUS BONDHU (Adams & Tucker, Boston, Mass.), black and white dog, 4yrs. (Dashing Bondhu—Novel).

BRANDON (J. O'H. Denney, Pittsburgh, Pa.), lemon and white dog, 4yrs. (Royal Rock—Nellie).

REX (T. H. Gibbs, Columbia, S.C.), black, white and tan dog, 5yrs. (Reed's Druid—Bessie Lee).

BELLE OF PIEDMONT (Edward Dexter, Boston, Mass.), black, white and tan bitch, 2yrs. (Dashing Rover—Ranee).

BLUE LILLY (Chas. Heath, Newark, N. J.) black and white bitch, 2½yrs. (Blue Drake—Gipsey Queen).

PENDENNIS (Chas. Heath, Newark, N. J.), black and white dog, 1¾yrs. (Blue Drake—Diana II.).

PRINCESS HELEN (J. Otto Donner, New York), orange and white bitch, 3½yrs. (Thunder—Bessie).

CLIFFORD (J. Otto Donner, New York), black, white and tan dog, 2½yrs. (Emperor Fred—Fairy Belle).

ST. ELMO IV. (Dr. S. Fleet Speir, Brooklyn, N. Y.), black, white and tan dog (St. Elmo—Clio).

WINDEMERE (Dr. S. Fleet Speir, Brooklyn, N. Y.), lemon and white dog (Druid—Countess Louise).

DASHING NOBLE (John Henricks, Pittsburgh, Pa.), black, white and tan dog (Count Noble—Dashing Novice).

COUNTESS (John Henricks, Pittsburgh, Pa.), black and white bitch (Leicester—Pocahontas).

QUEEN ALICE (Howard Hartley, Pittsburgh, Pa.), black, white and tan bitch, 6yrs. (Druid—Cubas).

IRISH SETTERS.

BLARNEY (E. W. Clark, Philadelphia, Pa.), dog, 2½yrs. (Bruce—Lurray).

POINTERS.

FLOTSAM (Howard Hartley, Pittsburgh, Pa.), black bitch, 2½yrs. (Sambo—Diana).

JETSAM (Howard Hartley, Pittsburgh, Pa.), black bitch, 2½yrs. (Sambo—Diana).

LUCIA (D. S. Gregory, Jr., 2d, New York), liver and white bitch, 4yrs. (Croxteth—Belle).

FLASH R. (D. S. Gregory, Jr., 2d, New York), liver and white bitch, 2½yrs. (Ranger—White Lilly).

SCOUT (D. G. Elliot, New Brighton, S. I.), liver and white dog, 4yrs. (Croxteth—Belle).

SNIPE (S. L. Pettit, New York), liver and white dog, 3½yrs. (Croxteth—Gyp).

DONALD II. (J. H. Phelan, Jersey City, N. J.), liver and white dog, 3yrs. (Donald—Devonshire Lass).

GRAPHIC (James L. Anthony, New York), liver and white dog, 4½yrs. (Sancho—Juno).

HALF AND HALF (Edward Dexter, Boston, Mass.), liver and white dog, 20mos. (Priam—Malt).

DUKE OF BERGEN (F. R. Hitchcock, New York), liver and white dog, 22mos. (Bang Bang—Fan Fan).

TAMMANY (F. R. Hitchcock, New York), liver and white dog, 2½yrs. (Tory—Moonstone).

POCAHONTAS (F. R. Hitchcock, New York), lemon and white bitch, 2½yrs. (Tramp—Grace).

SPOT (Charles Heath, Newark, N. J.), liver and white dog, 3½yrs. (Top—Fannie).

NED (Charles Heath, Newark, N. J.), lemon and white dog, 3½yrs. (St. Valentine—Beulah).

MAINSPRING (J. T. Perkins, Brooklyn, N. Y.), liver and white dog, 4yrs. (Mike—Romp).

BEAUFORT (Charles H. Mason, Bay Ridge, L. I.), liver and white dog, 6yrs. (Bow—Beulah).

BRADFORD (Charles H. Mason, Bay Ridge, L. I.), liver and white dog, 6yrs. (Bow—Beulah).

BRAHMIN VS. SILK.

Editor Forest and Stream.

Mr. J. Otis Fellows says he must stand up for his dog. I must, therefore, be allowed to do the same by mine when he is attacked. I don't mind a bit his decrying my champion Brahmin among his friends. That's all right and natural, I suppose; but when it comes to printing his views in such a representative paper as yours, I must object most vigorously. He says, "Do not consider me a disappointed exhibitor, for I am not." Of course he's not disappointed. Exhibitors are never disappointed when their dogs don't win. Oh, no! He says he won the kennel prize at Philadelphia and can do so again any time he likes to try. He forgets to mention that he won it on a walk-over, no other exhibitor having the requisite number of dogs entered to enable them to compete; so that the victory was rather a barren one and not much to brag about. Talking of walk-overs, would Mr. Fellows be so good as to inform me how many walk-overs his champion Silk has had when he won in the champion classes? Am I right when I say I believe that they were all walk-overs?—that is, no competition in any one of them. If this is so, Silk's champion prizes are about on a par with the Philadelphia kennel prize he seems so proud of. If Silk won a champion prize when he had a competitor against him I most humbly beg his owner's pardon, but I fear I am right in my surmise. At the Philadelphia spring show this year Helen beat Silk for the champion prize, and my Brahmin did the same at the autumn show; so that apparently Silk has been beaten whenever he met a competitor for championship honors.

Mr. Fellows says among other things that Brahmin is cat-sided. That must be a terrible thing! Will somebody please tell me what it means. Pardon my ignorance. He says his Silk is only faulty in coat and head. That is too bad, because a dog's coat and head are about the most noticeable parts of his anatomy. This reminds me of Katisha's remark in the 'Mikado" that she knew she wasn't beautiful, she knew her face was plain, but she had a left shoulder blade that was a miracle of loveliness. Probably Silk's left shoulder blade is also very lovely to behold if it were possible to see it through his very curly coat. Mr. Fellows's last remark is as follows: "I raised Brahmin from a puppy until he weighed thirty pounds and then I sold him." To sell him (was it as a field spaniel or as a cocker? as friend "Senex" would ask) was the greatest mistake of his life. If he had kept him he would have had a world beater, and saved postage and paper writing to your paper running him down! I bought Brahmin at the last New York bench show because he seemed a very good dog, having won first in the open class and also beaten Mr. Fellows's champion Silk for the special prize for the best cocker dog in the show and under Mr. Hugh Dalziel's judgment too.

The owner, Mr. J. Luckwell, of Woodstock, Ont., with whom I corresponded, informed me that Brahmin used to be owned by Mr. A. H. Moore, of Philadelphia, who could give me all information regarding him. I wrote to Mr. Moore, who referred me to Mr. E. S. Wanmaker, of North Carolina, who had his kennel books. Mr. W. wrote me that Brahmin was bred by Mark Gretton, Hull, Eng.; imported by Mr. A. H. Moore; born April 15, 1881; was by Easten's Bob out of Clew, etc., etc. If Mr. Fellows raised him from a puppy it is news to me, and I would be glad to have further information on the subject. It seems Brahmin had a lot of masters before he came to me—to stay. Mr. Fellows says he owned him, Mr. Luckwell certainly did, Mr. Schenk, of Burlington, Ia., says he did, I hear Mr. J. F. Kirk also owned him, and Mr. Luckwell tells me Mr. Moore was the original owner. If there are any more I would be glad to know, so that I can tell them that he is in good hands and well cared for. Mr. Fellows must be mistaken about the weight, or Brahmin must have got a great deal slighter. Otherwise all the gentlemen who have won prizes with him in the class under 28 pounds must be—well, no gentlemen. Brahmin has averaged about 26 pounds all last summer and I had actually to fatten him up a little for the Philadelphia show.

But enough of this. If Mr. Fellows thinks he has a better dog than mine let them meet at the next W. K. C. bench show (it matters not to me who the judge is), and let each man put up (or the other thing) fifty dollars a piece, and if Silk wins, Mr. Fellows can "take the pot" and I will be the "disappointed exhibitor." I herewith inclose my check for $25 deposit, and have to ask Mr. Fellows to cover the same within two weeks or forever hold his peace. ARTHUR E. RENDLE.

[We have returned Mr. Rendle's check, as it is against the rules of the FOREST AND STREAM to serve as stakeholder.]

BEAGLES AT PHILADELPHIA.

Editor Forest and Stream:

In reply to Mr. Krueger's denying "the assertion of Mr. Schellhass that all the parties who measured Bannerman last spring made him over 12 inches," I beg to say I have never made any such assertion, as it would have been ridiculous on the face, as of course I could have no means of knowing how many may have measured him. Quoting from memory at the time, I find I was mistaken in saying all of the referred to parties made him over 12 inches, etc., as will be seen from the following extract from a newspaper report of last spring's Philadelphia show, namely: "As Mr. Krueger requested a remeasurement of Bannerman we were at some pains to measure him. Of a half-dozen that measured him, two made him just 12 inches and the other four made him over 12 inches. The height of a beagle depends a great deal on how it is measured, and it often happens that the same person will make the same dog of different heights at different times. Mr. Krueger was no doubt conscientious in his measurement that made Bannerman less than 12 inches," etc. As it is very evident from Mr. Krueger's writings that he desires Bannerman to be an "under 12-inch hound," and as I certainly have no desire to prejudice any one against Mr. Krueger or his hound, I wish to follow my above quotation—for the benefit of those who have not read former communications on the subject—that Mr. Krueger is equally positive that his hound is under 12 inches, and that he has had others measure him who make him the same.

Mr. Krueger fails to see that this very fact goes to prove the truth of my assertion that there appears to be an unavoidable variety in measurements, and therefore there should be a sufficient leeway in height so that no legitimate sized hounds run any risk of being done the greatest possible injustice—barred out. Mr. Krueger's statement that he claims Bannerman under 12 inches "Mr. Schellhass to the contrary notwithstanding," is misleading and moreover uncalled for, as he has never known me to make any such claim, as I have never done so. If he is under 12 inches, then well and good, as I suppose his owner is then better satisfied. I certainly prefer to have him so classed as if I ever bred beagles to show, there would be one less hound for me to compete against. I only want to breed what I consider capable working stock, about as close to the limit of size as possible, nothing anywhere near as low as 12 inches. I am thoroughly in accord with the sentiments of one of the committee, who framed the A. E. Beagle Club standard, expressed in a letter written me in which he says, "After trying beagles of all sizes I am free to say that hounds over 12 inches are the most useful sort and for hunting I would prefer a dog a shade over 15 inches to one under 12, even if the larger dog were ruled out of competition at bench shows." In regard to Mr. Krueger's referring to several gentlemen to support his assertion that the judge made Bannerman under 12 inches, I know of no reason for doubting Mr. Krueger's word for the same. Moreover the records of the show are evidence of the same.

In regard to Mr. Krueger's bringing me to task for merely referring to the fact of his having entered Bannerman in the class for "champion beagles over 12 inches," and his claim that I endeavored to convey the impression that by so doing he considered Bannerman over 12 inches, I have only to say that Mr. Krueger must know I have written nothing to convey any such impression. It is self-evident that by entering Bannerman in the said class, only one of two constructions can be possible, either he must have considered Bannerman over 12 inches, or he willfully entered him in a class in which he knew he was not eligible; therefore he must excuse me for mentally placing the former construction on his act—certainly the most charitable one. I fail to see how there not being a champion class to fit any certain dog warrants an owner in entering said dog in any champion class he sees fit to.

As the standard of the American English Beagle Club gives no minimum limit of size, I think Mr. Krueger's suggestion good to have the clause "over 12 inches" struck from the champion class when judged by said standard, as, until they become far more numerous, the number of beagles under 12 inches does not warrant a separate champion class for them, there being, if I mistake not, at present only one beagle in this country eligible in such a class—namely, Mr. Krueger's Bannerman.

Mr. Krueger states that when Bannerman was measured as stated, he was improperly measured with sticks. I am informed that that was the way my beagle Trailer was measured when judged at the recent Philadelphia show, namely, with a lead pencil against the side of his stall.

Writing my former letter very hastily, I omitted to state that when my Trailer won first prize at Meriden, Conn., when 18 months old, he was not 15 inches high, and when 22 months old and judged at the New Haven show by Mr. John Davidson, than whom, every one tells me, there is not a more practical pointer, setter or hound man in the United States, he was not over 15 inches in height. Mr. Krueger remarks that it was "apparent" that my Trailer was over 15 inches. Granting for the sake of argument that my hound was a half inch, or even an inch over limit in size, Mr. Krueger well knows that neither he nor any other person has a sufficiently critical eye to be able to state as a fact that the hound was oversized. Although measured by several persons on several occasions, Trailer, when measured with standards, which the members of the committee who framed the standard tell me is the only proper and fair way, has been made by all under 15 inches, and the only times when made over 15 inches were when measured with what Mr. Krueger states he considers to be improper measurement, and by Mr. Krueger who regarded it as "apparent," and by those who "judged he was over 15 inches by looking at him"—rather indefinite convictions.

My remarks regarding Bannerman were mere statements of facts which would add proof to my subject, but judging from the tone of Mr. Krueger's letter he has misconstrued my former one, and preferring his hound to be under 12 inches, regarded my remarks as an attack on his Bannerman, which my letter certainly was neither in spirit nor reality.

Mr. Krueger's letter goes to prove my assertion regarding the variety in measurements. I cast no reflections on the beagle judge at Philadelphia, Mr. Stovell. As the clock now marks but twelve minutes before our open season of 1885 for rabbits, I will prepare to go out on the morrow at early dawn on a trail where I'm afraid I will have to show a little more animosity before I follow it to a finish. And as I fuss around the room to get all of my duds ready to take the early morning train down on the Island to a spot where I know the 'woods are full" of the little cotton tails, Music and Trailer lie on the middle of the floor fast asleep, and while snoring away dream no doubt of the many trails they will puzzle out, and how on the morrow they will make the crisp morning air resound with their joyous and melodious notes. May Mr. Krueger have as good a time with his Bannerman and other hounds as I hope to have with my Trailer and my others.

Trailer dreams. His legs frantically beat the air, his jaws quiver and snap and he presents a truly dangerous appearance as he dreams. I know that he is annihilating all who have "judged from looking at him" that he is over 15 inches. He raises his head up. He is now awake, and as his large eyes look up to me so softly and pleadingly, I know he mutely says to me, "I'll forgive them this time, Herm, but let them look out for me in the future."

The clock strikes 12! The happy day is here after months of waiting, to gladden the hearts of thousands of sportsmen.

Music! Trailer! wake up! Your Christmas of 1885 has come.

With true love for the little hounds and fraternal feeling toward all of their owners and admirers I say good night, to dream of rabbit trails and beagle hounds.

HERMAN F. SCHELLHASS.

BROOKLYN, N. Y., Nov. 1.

A DOG DICKER.—I will relate my experience with Hextamer M. Perry of the Sans Souci Kennels. In the *American Kennel Register* of August, 1884, I entered a litter of collies, by Eclipse, out of my imported Nesta, and a few days later I received a letter from "Courteously Yours" asking whether love or money would buy one. I called upon him and said $50 would buy one, but the price was too high for him. During the State Fair show of the following month I met Perry and he asked after the puppies. In the course of the conversation I said I must try and get some farm to board them at, whereupon he urged me to send them to his farm in the South; it would cost me nothing, etc., etc. Feeling a delicacy over accepting such a favor from a stranger, I let the matter drop, but it was revived by him several times after I had consented to let him act as veterinary at the National Breeders' show. A tacit understanding was arrived at that if he took the puppies he was to get some return, and matters were brought to a focus by his sending me an urgent note to have the puppies sent on at once. They were telegraphed for and arrived safely at West Philadelphia, whereupon I received a request to register the only dog and one of the bitches as sold to the Sans Souci Kennels. I wrote declining to do so, but saying that if he desired he might have half an interest in the litter and Nesta, and that I would take her to England with me and have her bred again to Eclipse. This I offered for $100, a very low sum, considering the price of Nesta was $150. This is part of his reply: "As to your proposition of yesterday I am unable to accept it. I will do this, however. I have a heavy gold Railroad, Quick-Time watch, which stands me (with a chain) $600. I will give you this watch for a half interest in Nesta and the five pups and $25 * * * The watch, I think, will net you $100 or more; as a personal time piece it is worth $150 to $165." I wrote accepting the offer, as I had every confidence in his integrity, and I received the watch on a Thursday evening and called to say I had it. It did not look very wonderful, but I presumed its goodness was inside the case. The next day, by daylight I saw it was much worn, and having missed Perry, owing to delay in packing my effects, I took the watch down town and had it valued, the answer being $35. I had to leave for New York on the three o'clock train, and after working all night there left early next morning by the Alaska for Liverpool. As the puppies were to have been shipped on Friday to the South, nothing could be done till my return. When at Liverpool I called at the address of the maker of the watch and found that the present occupant of the building had been there for over 25 years, hence the watch must have been something like 30 years old. On my return I had the watch valued at Bailey, Banks & Biddle, and I was told I would be foolish to allow more than $40 in trade for it. So that on that estimate (as I was presumed to allow $25 cash) I was getting $15 exchange for a bitch worth $150, five puppies, and going to the expense of about $60 for the second service by Eclipse. The day after my arrival I called on Perry and repudiated such a trade. But he insisted on its holding good, and sent me back the watch, which I later on sent him back for good. So much for the $165 watch. At the first interview after my return, he said he still had all five puppies on his hands; that they had all been sick, etc. I made him an offer a few days after to divide the puppies, he to have two. This brought from him the admission that one had been sold for $25, but as it was sick when sent away he expected it would die and he would have to return the money. I offered, then, to divide the four, giving him second and third choice, but he said he intended keeping them. Subsequently he wrote acknowledging that he had deceived me, and that before my return from England he had also given the dog away. I then said I would toss for first choice and let him name a give-or-take price for the third. This he also declined partly on the plea that tossing for first choice was gambling. I then placed the matter before the Philadelphia K. C., of which I heard he was a member. On the night of the club meeting I received the first letter for two months from him. He had been South; had seen the puppies six weeks before; had ordered one killed and would give me my choice of the other two provided I paid expenses of both to Philadelphia. Of this I took no notice. On May 18 he wrote the killed puppy had not been killed, and would accept my offer made five months before as to the division of the three puppies. This I accepted. Being notified of their arrival I went over to settle the business only to find that there were but two, one of the best having died most mysteriously. Mr. Perry was not on hand but he left word he would give or take $10 for first choice of the two and I gave the money. As to the puppies disposed of, the one sold was not sold for $25, but for $15 and two puppies out of the first litter. He could not even tell me the truth about that one. The dog Comet, which he gave away, he got out stud cards for within a week of the matter being closed and he always declined to tell me to whom he had given the puppy. Others can draw their own conclusions as to the "give away." With all these facts before them, the members of the Philadelphia Kennel Club decided that Hextamer M. Perry was a proper and fit person to be on the club roll. Now Mr. Comfort, the secretary, says the club feels chagrined, but the members have only themselves to blame for what FOREST AND STREAM

styles the "Collie Fraud of Philadelphia." I see in the paper for this week that Mr. Comfort says that on Oct. 20 Perry acknowledged that his fifth entry, So So, was not on hand during the judging. Permit me to say that an influential member of the club told me this week that Perry up to the very last moment maintained she was present and this is borne out by his letter to Mr. Apgar of Oct. 13. As to So So being too sick to stand up, and only kept at the show at the risk of death, as stated by Perry to Mr. Apgar, I can testify that the animal benched as So So was as well as any one could be. I, like others, failed to get the benched So So to answer to her name, which all four of the others did readily. To paraphrase Mr. Mason on "Wildfowler," "I know Perry." —*Jas. Watson in Sporting Life.*

ANOTHER CANINE MAIL CARRIER.—The West Shore Railroad train which leaves Weehawken shortly after 6 o'clock every morning is known as the Montreal express. The same train leaves Albany a few minutes after 2 o'clock in the afternoon, and it is designated the New England express. A United States mail car is attached both ways. The chief clerk on duty this week is W. Wirt Bailey, an old soldier whose face is scarred, the result of wounds received at Gettysburg. On the express' down trip yesterday afternoon a number of passengers, together with a member of the *Freeman's* staff, noticed that as the cars whirred past Lewisburg, a little bit of a hamlet situated about one mile south of Highland, a mail pouch was thrown from the postal car, and immediately picked up by a big black Newfoundland dog, which could be seen trotting off with the pouch as sedately as a deacon toward the post-office. When the train reached Marlborough, postal clerk Bailey was asked: "Does that dog meet you every trip you make past Lewisburg?" "Yes, sir. It has never missed a run, rain or shine. By George, sir, that dog knows twice as much as some men. He's the mail carrier. All the clerks and railroad men know him well."—*Kingston Freeman.*

WE SHOULD SAY SO.—A daily paper reports that the members of the Palmer's Island Shooting Club, of Currituck, N. C., are waiting with considerable anxiety the result of a scientific cross of animals recently suggested by Mr. John G. Heckscher of this city, for the purpose of creating a new breed of duck retrievers. The dam of the litter is a remarkable animal belonging to Lieut. William H. Emory, U. S. N., which he secured in the Arctic regions and brought home with him on the Bear. The animal has the tail and hind legs of an otter, the head of a bear, and body of a dog. It is supposed by the Lieutenant to be a cross between these animals. The sire of the new breed is Mr. Heckscher's dog, which is a half Newfoundland and half English setter. It is thought the new breed will be a wonderful accession to the race of sporting dogs of this country.

WESTERN PENNSLYVANIA POULTRY SOCIETY.—Pittsburgh, Pa., Oct. 29, 1885.—*Editor Forest and Stream:* At a meeting of the Western Pennsylvania Society held Monday, Oct 26, it was resolved to hold a bench show of dogs March 16, 17, 18 and 19, 1886.—C. B. ELBEN, Secretary.

WESTERN CONNECTICUT SHOW.—Winsted, Conn., Oct. 31.—*Editor Forest and Stream:* I was premature in announcing that Jas. Watson would judge all classes. J. M. Tracy, of Greenwich, Conn., will judge pointers and setters, and Mr. Watson all other classes.—F. D. HALLETT, Supt.

KENNEL NOTES.

KENNEL NOTE BLANKS.—For the convenience of breeders we have prepared a series of blanks for, 'Names Claimed," "Whelps," "Bred" and "Sales." Laurian. Smooth coated St. Bernard dog, whelped April 13, 1885 (Alp II., A.K.R. 705—Alma, A.K.R. 27), by Chequasset Kennels, Lancaster, Mass., to E. L. Smith, Portland, Me.

Topaz. English pug dog, whelped Apr 1, 1885 (Doctor—Dolly, A.K.R. 170), by Chequasset Kennels, Lancaster, Mass., to A. S. Quigley, Harrisburg, Pa.

Trust. English pug bitch, whelped April 5, 1885 (Young Toby, A.K.R 473 Tantrums, A.K.R 220), by Chequasset Kennels, Lancaster, Mass., to E. L. McKee, Indianapolis, Ind.

IMPORTATIONS.

Nero and Favorite W. J. Ebrich, New York, has imported the dark red, white markings, rough-coated St. Bernard dog Nero, bred by Schumaker, Berne, Switzerland, whelped November, 1883 (Apollo—Diana). Also Favorite, white and fawn, whelped July, 1883, bred by Eschaggeny, Thun, Switzerland.

DEATHS.

Lord Wallace. Black, tan and white collie dog (A.K.R. 2605), owned by W. Atlee Burpee & Co., Philadelphia, Pa., Oct. 12, from distemper.

Rifle and Trap Shooting.

"Forest and Stream" Trajectory Test.

NEARLY three months ago, in August last, the FOREST AND STREAM announced that it would take upon itself the labor and expense of a trial of the trajectories of hunting rifles. The question was one of much importance to every man who uses the rifle in the field, and the discussions from time to time in our columns showed that it was a live topic. There was a large degree of uncertainty as to what was the actual trajectory line of various makes of open sight rifle. Many claims had been put forward for this or that rifle, some private experiments had been made, many of them of a most interesting character, and their results had been duly set forth in our pages. Some more general tests had been made and reports covering them given to the public, but there still remained a gap to be filled by just such a set of thorough trials as those conducted by and under the auspices of the FOREST AND STREAM were intended to be.

The general plan was a very simple one. It was first to call in a competent surveyor and have a range laid out, then to place the actual manipulation of the trials in the hands of an expert who should make a report of the actual figures obtained by him. In this way we hoped to put the result obtained beyond all question of doubt or uncertainty. The details of the trial were many and required much time and labor.

We invited suggestions as to the carrying out of the tests, and the vast correspondence which at once sprung up showed how much interest was felt in the work. Some of these letters, as far as space permitted, were spread before our readers, but many more were not put in type. Some of the hints given were valuable, others were evidently given under a misapprehension as to what a trajectory test really was and what it was that we were striving to discover.

The task which we have undertaken grew with each successive day. "A dozen rifles, perhaps, and a couple of days' time on the range," was the first off hand estimate made. Instead there have been over thirty rifles, the very pick of nearly a dozen armories and as fine a showing of the perfection to which American small arm manufacture has grown as were ever gathered together at one time. As the work grew, so did the disposition to meet the demands put upon us. We recognized that there were among our readers users of every make of rifle now on the market. One subscriber in the Western plains has a heavy express rifle, using a charge of powder running up to a hundred grains or more. He is particularly concerned to know just how far the bullet goes above the line of fire in traversing a certain range. Then the army of men who use the smaller caliber weapons;

of squirrel hunters who would like to know just what their favorite rifle is capable of doing. The test grew in this way to be a tournament, and from a few hours' work on the range, which it was at first anticipated would complete the outdoor part of the trial, a full fortnight of hard work from daylight to dark was taken up. We have no regrets now that the problem grew to such wholesale dimensions. We would rather congratulate the riflemen of America and of the world that they have such a choice of desirable weapons.

Of course, a test of this sort is not alone of rifles; it is rather of ammunition. The first question put, and especially from the rifle makers, was, "What ammunition do you propose to use?" This was very readily answered. As we wished to take the ordinary commercial rifle from the arm-maker's on the one hand, it was only natural that we should take the factory ammunition to use in such rifle. We know that there is a feeling against factory ammunition, and that the term is used as synonymous with unreliability. This should not be so, and in great measure it is a fiction—a convenient one, perhaps, to account for bad scores, but one which we believe exists rather in the imagination than in fact. We did not intend the trial to cover the lines of fire of certain arms loaded in a special manner; rather the demand was for a stock rifle such as the average purchaser gets in response to an order sent to the factory, and with this to use the cartridge advertised for it, recommended by the seller and maker of the rifle and procurable by that same average purchaser through an order on any one of the cartridge companies. Such a test would interest the multitude of marksmen; any other would be perhaps a more or less valuable contribution to the science of rifle-shooting, but rather theoretical than practical.

To test the matter thoroughly it was but fair that the figures of the trajectory heights should be given in connection with the figures of weight, etc., discovered by a dissection of the cartridge. This has been done, and to guard against drawing a general conclusion from too limited a premise, the average of three cartridges will be shown, just as on the screens the average of five shots was secured.

How to secure the rifles for the test was a question carefully considered. One plan was to have them sent on trial as to a prospective purchaser, and in this way secure a weapon fair to the maker and on the other hand prevent the placing upon trial of a special arm, perhaps carefully selected from a large number or made up for the purposes of the test. This might have been a satisfactory method so far as results were concerned of getting together the collection of arms used, but would have been very complicated. There is no reason to believe that the rifle makers have any fear of fair competition, and the alacrity with which they came forward and proffered arms for the trial showed that they had no apprehensions as to the result of such an impartial trial as the FOREST AND STREAM proposed to carry out. It was finally concluded to invite the makers to send arms, and on Sept. 17 the following note was sent:

"In making the trajectory tests of hunting rifles, which have been announced in our columns, we wish to include the ——— rifle. The main test will be over the 200yds range from a fixed rest through accurately placed screens. We should particularly like to have from the rifles in stock at your works the rifle you would most strongly recommend for all-round hunting purposes. All express and other charges to be paid by us, etc."

This invitation to participate was sent to the principal rifle companies making the following arms: Remington, and Remington-Hepburn, Whitney, Marlin and Ballard, Bullard, Colt, Winchester, Maynard, Wesson, Stevens, and Bay State. The responses came in promptly, and showed on the part of the makers a hearty concurrence in the views and endeavors of this journal. The Whitney Arms Company said: "We will be glad to loan you a rifle for the purpose mentioned. We take it that you want a magazine rifle and we propose to send you to-morrow from our regular stock one of our .40-60 Kennedys, which takes the regular center-fire W. cartridge. All things being equal we have no fears but that the Kennedy will rank with the best." The Winchester Repeating Arms Company said: "We have no choice in the matter of guns which we should like to have tested. Please examine our catalogue sent with this, choose such as you would like to try, and we will send them to you at once."

Lamberson, Furman & Co., agents for E. Remington & Sons, answered, "We will refer your favor to the factory and endeavor to meet your views in the matter."

The Colt Patent Fire Arms Manufacturing Co., of Hartford, replied: "Would say that our .44 and .38-caliber sporting rifles use the same cartridge as the Winchester, Kennedy and other rifles of similar caliber, therefore the trajectory of these rifles would be substantially the same. For our .32-caliber rifle we have a special ammunition made by the Union Metallic Cartridge Co., which we believe makes its shooting qualities superior to any in the market using so light a charge. We would be pleased to enter one of these for the purpose indicated in your letter."

The Bullard Repeating Arms Co. said: "We should be pleased to avail ourselves of your offer to include our rifle in your trajectory test which you are about to make. We are willing for our rifles to be thoroughly tested and do not hesitate to send a full line."

The Marlin Fire Arms Co. responding said: "We should like to have you inform us whether you also want us to furnish the ammunition for testing the rifles or whether you intend to procure it yourselves and if so whose make it is to be. In addition to the Marlin we should like to submit a few Ballard rifles, which, as you probably know, are also very extensively used for hunting."

J. Stevens & Co. at first found it impossible to send rifles for the test, but later, after arrangements had been made to secure this rifle elsewhere, a full line of Stevens rifles were sent and were tested.

The Bay State Rifle Company wrote: "We use regular factory ammunition for our rifles, and do not think they are what you require for trajectory tests." No further concern was taken with these arms.

Mr. F. Wesson was away from home at the time of the letter writing, and in order that the rifle might not be omitted entirely from the tests, one was procured from the extensive stock of Henry C. Squires, 178 Broadway, through the courtesy of that dealer, and placed in the trial.

The Massachusetts Arms Company put in one of the Maynard rifles, saying in their note accompanying the package: "Our experience is that the flattest trajectory rifles are not the closest shooters, but that a good deal of accuracy is sacrificed for flat trajectory."

From Thos. Bland & Sons, of 106 Strand, London, makers of the well-known Bland rifle, came a note saying: "We are indebted to Major W. H. Merrill for information that the proprietors of FOREST AND STREAM intend instituting a trial of rifles. We wish to enter the list and have given Major Merrill to understand our wishes. Major Merrill will make all arrangements for our entry." In accordance with this a double-barreled express rifle, the same used in the trials of the London *Field* and which provoked so much discussion in Great Britain, was placed at the disposal of our experts.

In addition a Sharps hunting rifle, carrying the Government 405-grain bullet cartridge, was placed in the test, and for comparison a State Model Remington of .50-caliber and a regulation three-groove Springfield rifle using the 500-grain bullet was placed on the trial rack. This completed the list of breechloaders, somewhat extended beyond our original plan of a test confined to hunting rifles, but not to any great extent. There were a pair of muzzleloaders, one the property of Major Merrill, tested at 100 yards only, while the other was brought and tried by G. T. Romer, of Peekskill, the shooting associate of Major Merrill in many of his trajectory and other rifle tests. This rifle was tried only at 200 yards. Each of the two last named weapons were of the heavy, magnifying-sight order, and with heavy charges maintained a high degree of accuracy. The full list of rifles in the test was as follows:

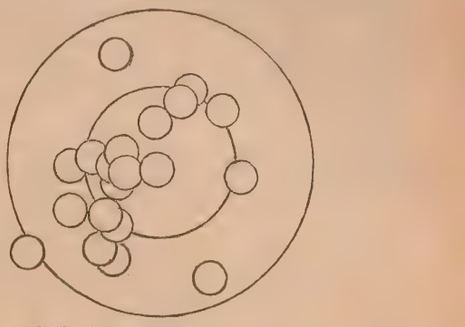
1.	MARLIN	.45
2.	MARLIN	.40-70
3.	MARLIN	.38-55
4.	MARLIN	.32-40
5.	BALLARD	.40-85
6.	BALLARD	.40-70
7.	REMINGTON	.40-65
8.	REMINGTON	.38-50
9.	REMINGTON	.32-40
10.	REMINGTON	.32 R. F.
11.	REMINGTON	.50 N. Y. State Model.
12.	WINCHESTER	.50 Express.
13.	WINCHESTER	.45-75
14.	WINCHESTER	.40-60
15.	WINCHESTER	.22 Long.
16.	BULLARD	.50 Express
17.	BULLARD	.45
18.	BULLARD	.40-70
19.	BULLARD	.38
20.	BULLARD	.32
21.	WHITNEY	.50 Express
22.	WHITNEY	.40-60
23.	STEVENS	.38 C. F.
24.	STEVENS	.32 R. F.
25.	STEVENS	Hunter's Pet, C. F.
26.	STEVENS	.22
27.	MAYNARD	.40-70
28.	WESSON	.44
29.	COLT	.32
30.	SPRINGFIELD	.45 Govt.
31.	SHARPS	.45 Govt.
32.	BLAND	.45 Express
33.	MERRILL	Muzzleloader
34.	ROMER	Muzzleloader

Except in the case of the muzzleloaders and the Maynard, the ammunition was procured entirely apart from the rifle maker. In not a few cases, boxes of cartridges were shipped with the rifles, but in each instance this ammunition was laid aside, and at the tests only such was used as had been purchased over the counters of one or another of the gun shops of this city.

[TO BE CONTINUED.]

RANGE AND GALLERY.

BRIDGEPORT, Oct. 28.—The Empire Rifle Club, of Thomaston, Ct., were the guests of the Bridgeport Club and engaged in a friendly contest with the rifle at their range. After the shoot, the score of which is given below, the visitors were given the finest style of shore dinner, and carried away pleasant memories of Readmore Range:



Bridgeports.

A FAIR TARGET.—South Haven, Mich.—*Editor Forest and Stream:* I herewith send you a copy of 20 successive shots at 50yds. with rest, done with a 26in. .22-cal. center-fire Maynard rifle, without wiping or cleaning, using 10grs. of Hazard FFG powder and a 45gr. naked bullet, such as are now made by the U. M. C. Co. for this special rifle. The shooting was done at the center of a white target 5in. square, with globe sights and a pair of eyes fifty years old, in a

gale of wind, and did not occupy more than 10 or 12 minutes time. It will be observed that 14 out of the 20 shots hit an inch ring and all struck the size of a silver dollar. The string of the 20 shots is 10¼in., not a very wonderful performance to be sure, compared to strings that have heretofore been made with both the breech and muzzle-loaders at the same distance, but is just a sample of what can be daily done with small calibers and naked bullets and that too without the exacting nuisance of wiping after each shot.—H. M. AVERY.

WORCESTER, Mass., Oct. 27.—The annual target shoot of the Worcester Light Infantry, Co. C, 2d Regiment, M. V. M., was to-day; 25 members tried their skill as marksmen. The shooting was off-hand, distance 200yds. Among the scores were the following:

A C White	44454—21	F W Hopkins	33434—17
R A Moran	54444—21	R W Mathews	32432—14
H A Marvin	43344—20	Lieut J E Lancarte	04323—12
Capt E A Harris	43444—19		

The first prize was awarded to Private White, his score showing improvement.

Oct. 28.—A team consisting of members of the Worcester City Guards, Co. A, Second Regiment, went to Springfield to-day for a friendly shoot. At the recent State Militiamen's Match they were tied with the Peabody Guards, of Springfield, Co. G, Second Regiment. The result of the shoot was an engraving presented by J. D. Gill, of Springfield, and was received by Worcester. The scores were:

Co. A, of Worcester.		Co. G, of Springfield.	
Lieut Early	5448454—28	Lieut Leonard	3304404—18
Sergt Cleveland	2443243—22	Sergt Adams	4444444—28
Corp Tisdell	0353444—23	Corp Stearn	5344434—26
Pvt Jefferson	434 343—25	Pvt Hooker	2433242—22
Pvt Johnson	0255434—23	Pvt Cavanaugh	4232432—17

Pvt Bellons	3244425—24	Pvt Bumstead	3453444—27
	169		161

GARDNER, Mass., Oct. 28.—At the last regular meet of members of the Gardner Rifle Club more than the usual number were present. The meet was at Hackmatack range. The inch ring target was used, with a possible score of 120 in 10 shots. The results of the two strings were as follows:

G F Ellsworth	101	100—201	George Warfield	77	53—130
A Mathews	83	93—178	H Vincent	47	50— 97
G H Heywood	85	84—169	C J Crabtree	42	35— 77
W C Loveland	88	67—155	C N Edgell	51	.— ..
L S Walker	78	76—154	W Austin (at rest)	100	.— ..
James Newton	80	71—151			

THE NEW BRITISH ARMY RIFLE.—"The results of the labors of the committee appointed to provide a new and improved rifle for the army, which have just been published," says the *London Post*, "show that the future weapon of the British army will, as regards most considerations, be far in advance of the service arm of any other nation. In the new weapon the Martini breech action has been retained, the alterations being in the barrel and the weight of the projectile, the combination being called the Martini-Enfield. Taking the Martini-Henry as a standard of comparison, the diameter of the bore has been reduced from .45in. to .40in., the weight of the new bullet being 384 grains, as compared with the 480 grain bullet of the old rifle. The powder charge, however, of 85 grains, remains the same, with the important result that the muzzle velocity of the bullet is increased from 1,315ft. per second to 1,570ft., thus lowering the trajectory to such an extent that while the Martini-Henry bullet in traveling 500yds. rises more than 84ft. above the line of sight, the improved projectile would scarcely go over the head of an infantry man if fired from the ground level. This is a most important consideration, as it minimizes any errors in elevations which might arise either from excitement or miscalculation. The system of grooving adopted is the ratchet, the number of grooves being nine, as against the seven of the Martini-Henry, although the latter is the largest number employed in any military rifle in the world, while the twist of the bullet has been increased from one turn in 22in. to one turn in 15in., the latter being again in excess of anything which has yet been used for service purposes. In addition to the important reduction in the height of the trajectory, the higher velocity of the bullet and the improved rifling have shown remarkably good target results, the mean deviation of the new bullet being only .3ft. and .95ft. at 500 and 1,000yds. respectively, as against .55ft. and 1.85ft. from the Martini-Henry. Another very important feature is that the recoil of the new weapon is considerably less than that of the present service arm, which has caused so much adverse comment. Experiments are also being made to provide the new weapon with an attachable magazine, so that the soldier will be able to deliver a rapid fire of several shots without reloading, in cases of emergency."

BOSTON, Oct. 31.—The prospect of a cold windy day occasioned a poor attendance at Walnut Hill to-day. The weather was unfavorable and few scores were finished. Following are the best of the finished scores:

Decimal Off-Hand Match.

R Reed, A	10	10	9	10	8	5	8	8	9	10—87
B G Warren, C	5	10	10	6	6	8	8	10	9	5—77
J R Missam, A	9	8	4	8	8	5	9	6	9	4—70
J Lennons, C	7	8	7	8	4	7	8	4	8	4—70
